MEET US AT THE

National Dairy Show

Minnesota State Fair Grounds

OCT. 8th to 15th

Booths No. 146-177

The Whole Mississippi Valley Is On Its Toes

Determined to make a brilliant success of the 15th Annual Dairy Show—which for the first time is held West of Chicago

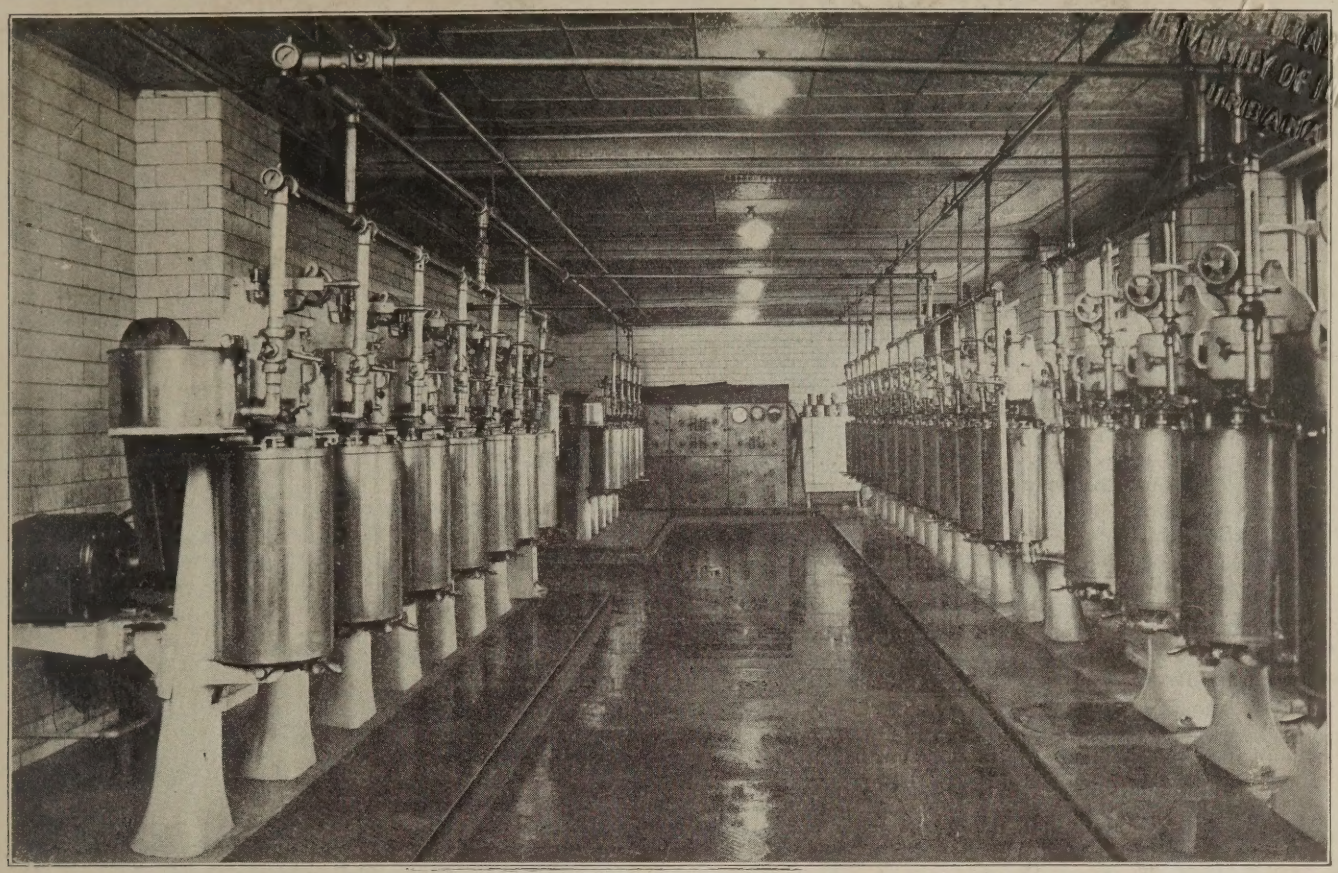
While our business is national and international in its scope, we feel peculiar pride in the marvelous growth of the milk industries in Iowa and its neighbor states; for we have played a part in this development for more than forty years.

And we are so delighted that the world's **greatest** Dairy Show is to be held in our "home country" that we are making extraordinary plans for an exhibit that shall eclipse all former efforts.

As "Prairie Citizens" therefore, we extend fraternal greetings to the milk-using industries of States further East, further West and further South, and urge every man who wishes to see the highest development of the mechanics and methods of his business, to come to the National Dairy Show, and bring his customers and friends.

Tell your friends and neighbors **you are going** to the world's greatest Dairy Show, Minnesota State Fair Grounds, St. Paul, October 8 to 15.

When you come, make the Cherry Exhibit your Headquarters. Study our



Gravity System Milk Plant.
Twin Coil Line of Pasteurizers
Single-Roll System of Churns.
Brine System Ice Cream Freezers

and all the other up-to-date equipment tools and supplies which we have created for increasing the efficiency of milk plants, creameries, and ice cream factories.

AUGUST 1921

SPECIAL attention is called to the several articles in this issue of The Ice Cream Review concerning flavors, extracts and gelatines. We feel that these ingredients of The National Dish are of sufficient imimportance to merit special attention, hence this issue is devoted especially to them. Possibly no phase of ice cream making has been improved upon more during the past few years than that dealing with flavors, extracts, and gelatines.

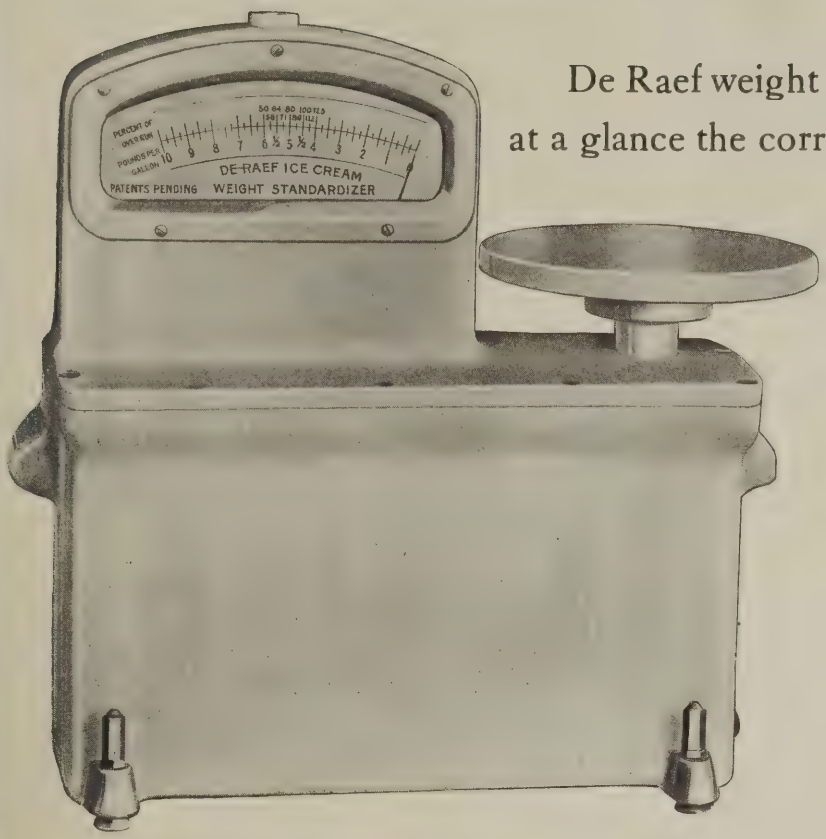
It is but a comparatively short time since ice cream manufacturers were handicapped by poor materials and lack of knowledge about using them. What was once accomplished by guess is now accomplished by definite rules, and of course uniformity of product is only possible when definite rules are followed. Pure, improved flavors and extracts have made it possible for the ice cream manufacturer to put out a uniform product, and they have also made it possible for him to add the variety necessary for heavy consumption. The improvement in gelatines has been no less marked. Besides improving their product the manufacturers have spent large sums of money educating the public relative to the use of gelatine. They have helped materially to stabilize and popularize the ice cream industry.

WE WISH that every reader might have the opportunity to read and analyze the various business messages that cross the editor's desk, some on the way to the waste basket but never until we know, at least, the burden of their story. The man who is looking for the hole in the doughnut can find plenty to appease his pessimistic appetite, but the man who is looking at the doughnut can get abundant evidence that the present depression in business will be shortened to the extent that business men take hold and shorten it. Thomas Edison is quoted as having said the following one day recently:

> "I have been through five depressions during my business life. They all act alike. This latest one acts exactly like all the rest. The men, who if business fell off 66 per cent increased their selling effort 75 per cent managed to pull through as if there was no depression, and the efforts of such men tend to shorten the periods of depression."

The preponderance of evidence coming to us is in favor of the optimist's view. Business men who, a few weeks ago, felt that they were in for a protracted depression are taking a new grip and are helping to shorten the depression period. It's good business for them to do so. It will probably be a long time before conditions are as favorable for the average business man as they were two years ago, but no sensible person is looking for their return. We are now paying the penalty of enjoying them when we did. It is possible, however, for good, sound business conditions to prevail very soon. The "buyer's strike" can't continue much longer. The business man who sells him when he starts buying will be the man who has kept pounding away, not the man who gave up when conditions were against him.

Don't let anybody tell you that business is poor without assuring him that business is good with you. Business is good and will be better for the man who makes it good. It just takes more hard work and hard pushing now, that's all.



ANNOUNCEMENT is made by the secretary of the Indiana Manufacturers of Dairy Products that his Association has pledged itself to pay $1,000 to the fund being being raised to hold the World's Dairy Congress in this country next year. He also congratulates the members on the fact that their Association is the first in the country to take such action.

We want to add our congratulations. They have taken an advanced step in association activities, and it is to be hoped that their example will lead many others to follow. Dean Van Norman needs the encouragement of the various dairy organizations quite as much as he needs the help of individuals. If the affair is to be truly representative of world dairying the entire strength of the industry in this country must be utilized in putting it over. We believe that "the Dean" can do it.

Standardization of Ice Cream

By Weight Per Unit Volume

De Raef weight standardizer tells you at a glance the correct weight per gallon, and the correct over-run per gallon of ice cream, while the ice cream is still in the freezer, giving the ice cream maker full control of a set weight per gallon as well as a given over-run.

No weights—no charts—no counter balances —no telescopic cups — no adjustments — no magnifying glass to read dial—no figuring—always ready for operator—water proof and rust proof.

Works automatically—reading can be made ten feet away—large black figures on white dial. Will give correct weight and over-run per gallon of ice cream, regardless of weight per gallon of mix.

De Raef Ice Cream Weight Standardizer circular sent on application to the Ice Cream Department

N. A. KENNEDY SUPPLY COMPANY

KANSAS CITY MISSOURI

ON ANOTHER page in this issue will be found an announcement by the management of the National Dairy Association regarding membership in that organization. Heretofore only life memberships have been available, but now associate memberships are offered, such memberships being good for one year and carrying with them the same "say so" in the affairs of the association as the life memberships.

The National Dairy Show is the biggest event in the dairy world. It undoubtedly is more representative of all the many branches of the industry than any other organization in the country. The man who, because of his membership, is connected with this great enterprise can rightfully feel that he is shoulder to shoulder with the big men in the industry. This should in itself be well worth the cost of an associate membership to any man who earns his livelihood in the dairy business.

Then, too, he has further compensation. He can feel that he is rendering a distinct service to the industry. He can feel that he is loyal to the demand which comes to every man who is profiting from the benefits derived by the entire industry through the development of the National Dairy Show. He can rest content in a duty performed.

You can make no better investment than to join hands in this big work. If you are not a life member of the National Dairy Association become an associate member.

SOME men stay away from conventions because they can read the reports in the dairy press. At least that is the excuse offered by them. We have always considered this a poor excuse, about on a par with the one offered by the small boy for not attending Sunday school. He discovers a rip in his best pair of pants too late to be repaired after fearing for the entire week that his mother would find them and fix them.

Trade conventions are absolutely essential to the proper development of an industry. Conventions are largely what the delegates make them, and a good attendance always means a good convention. The man who stays at home because he "can read about it in the papers" means a poor member of an association. He may pay his membership dues and think he is doing his duty, but he is mistaken. Circumstances may, of course, prevent a man from going to the annual meeting of his trade association but he should have a better excuse than the one above mentioned.

MEET us at the National Dairy Show, Minnesota State Fair Grounds (Twin Cities) October 8 to 15, 1921

IT MAY be news to some of our readers to know that butterfat is a "by-product" in the estimation of some folks. A circular letter mailed out by a manufacturer of "filled" milk to his trade has reached our desk. In explaining the cost of his product he says:

> "With the low butter market the cost of manufacture of the compound is, in a measure, proportionately higher as the by-product butterfat, which we extract to produce our product, necessarily has a lower market value, thus increasing the cost of manufacture."

You fellows who have been brought up to believe that butterfat is the most valuable constituent of milk are all wrong. Butterfat is a "by-product" and the old cow from now on will be wasting her time. She should be ashamed of herself.

A DETERMINED effort has been made in several of our large cities to compel the retailer of ice cream to come down off his high horse and sell the National Dish at a fair profit instead of an exorbitant profit. In Chicago prices were reduced about one-third inside of 48 hours after one of the big city dailies began publishing facts.

From all we can learn the retailers in the large cities are not the worst profiteers by any means. Back in the country towns most of the retailers haven't heard that the war is over. They are still charging war-time prices and no doubt will continue to do so as long as they can get away with it. If every man who is retailing ice cream at an extortionate profit were put where he belongs our jails would be awfully crowded.

A WESTERN dairy paper heads an editorial "The Ice Cream Season is On." How long is it going to take to educate the consumers of this country that the "ice cream season" is all the time? We can't answer the question definitely, but it is going to take too long if dairymen themselves persist in referring to the hot weather as the "ice cream season."

BULLETIN OF EVENTS

National Dairy Show, Minnesota State Fair Grounds (between St. Paul and Minneapolis)—Oct. 8-15, 1921. W. E. Skinner, General Manager, 910 So. Michigan Ave., Chicago, Ill.

National Association of Ice Cream Manufacturers—Twenty-first Annual Convention, Hotel Radisson, Minneapolis, Minn., Oct. 10, 11 and 12, 1921. Secretary, N. Loewenstein, 155 No. Clark St., Chicago.

Eastern Exposition, Association of Ice Cream Supply Men—At Elmwood Music Hall, Buffalo, N. Y., October 31st to November 5th, inclusive. Roberts Everett, Secretary, 1328 Broadway, New York City.

Southern Association of Ice Cream Manufacturers—Ninth annual convention, Atlanta, Georgia, Nov. 29, 30 and Dec. 1, 1921. J. W. Clopton, Decatur, Ala., Secretary.

Southern Exhibition—Association of Ice Cream Supply Men, Auditorium Armory, Atlanta, Georgia, November 28-December 2, inclusive. Roberts Everett, Secretary, 1328 Broadway, New York City.

Oklahoma Association of Ice Cream Manufacturers—Annual convention, Oklahoma City, Dec. 12-13-14, 1921. Secretary, M. T. Cochran, Altus Ice Cream Co., Altus.

Texas Ice Cream Manufacturers' Association—Fourteenth Annual Convention, Ft. Worth, Texas, December 7, 8, 9, 1921. Headquarters, Texas Hotel. H. F. Owsley, Dallas, Secretary.

Louisiana Association of Ice Cream Manufacturers—Second Annual Convention, New Orleans, January, 1922. Newton F. Manning, Monroe, La., Secretary.

Michigan Allied Dairy Association—Annual Convention, in Municipal Auditorium at Saginaw. Tentative dates, Feb. 14, 15, 16, 17, 1922. H. D. Wendt, General Secretary, Lansing.

(Continued from July issue)

Chairman: The next number on the program is "A More Logical Legal Standard," by Prof. H. H. Sommer, of the Department of Dairy Husbandry, University of Wisconsin.

* * *

A MORE LOGICAL LEGAL STANDARD

By Prof. H. H. Sommer, Madison.

Gentlemen of the Convention: In choosing a topic to apprise this convention this afternoon I chose the topic, "A More Logical Legal Standard." I realize I am probably stepping on dangerous ground. I chose it because I think it is a subject to which we ought to give more attention. It is a subject that will probably be forced upon us from other sources. It may come up in the legislature, and you who are interested in the industry should be prepared to make your recommendations.

The present standard is somewhat illegal and inadequate. The purpose of any department is to control its composition so that the consumer is insured a given amount of the valuable constituents in that product. This does not hold in our standard for ice cream, our present standard. Ice cream contains varying amounts of air, as you are all aware, because sold by the gallon. Our present standard does not take these factors into consideration. It simply requires that the mix must have a certain amount of fat. We can readily see our present standard does not guarantee a definite amount of food value to the consumer, and it is because of that I am bringing this topic to your attention. It may seem on first thought that this state of affairs is advantageous to the ice cream manufacturers, but in thinking it over you will see this is a situation which may be deleterious to the industry in general. As long as we have no restriction on the overrun, there will always be the tendency to increase the yield by whipping in more air. Of course a certain amount of air is necessary to produce an acceptable product, but we can go over that, and the tendency has been in a good many cases to increase the yield at the expense of quality.

The ice cream with excessive overrun does not meet with the enthusiastic approval of the public, it does not stimulate enthusiastic use of ice cream in general, and it hinders the growth of the industry. The lack of a standard causes a a lack of confidence in ice cream as a food material, and our advertising of ice cream as a food, our attempt to increase the sale of ice cream lacks effect because of the inadequate standard. It is not convincing. All our standard foods are carefully controlled by government standards, their composition is described in the value of constituents of the food. In our ice cream the percentage of fat is prescribed, but the overrun is left to each manufacturer, what the consumer is getting for the gallon of substance he buys. We cannot expect the public to think of ice cream seriously as a food as long as we don't regulate it as a food. The growth of the ice cream industry depends upon the attitude of the public. If the public thinks of ice cream largely as a luxury and confection, the growth of the food is impeded. If the public thinks of ice cream as a food, then the industry has a food. It can be properly regarded as a food, but in order to make it convincing to the public we will have to safeguard this product better than our present standard does.

Several remedies have been suggested. I don't want to be dogmatic. My object is to stimulate thought on this subject. A suggestion that we limit the overrun has been made. This seems to offer some difficulties because it would place a limit on the variety of mixes we have; by just having one overrun standard we would probably be doing injustice to some who want a high solids mix. So that does not seem promising. The suggestion has been made that ice cream be sold by weight or that it have a certain weight per gallon. These suggestions very evidently have their faults.

The suggestion that seems most logical is that the ice cream would have a given weight of fat and solids per gallon. That would be defining the value of ice cream in a very definite way. The advertising and the emphasizing the food value would be more effective. Do not limit the overrun except as it does so indirectly. The overrun could vary in proportion to the solids.

I have prepared a table here illustrating that. I have placed in the first column the total solids of the five mixes running from 30 per cent to the extreme 50 per cent solids in the mix. In the next column I have placed not figures found in actual experience, but figures as to the weight of the mix. Those will vary with the nature of the solids in the mix. The next four columns I have placed the corresponding overrun that would be permissible by law if we required 1.6 pounds per gallon for ice cream we see the highest permissible overrun would be 76 per cent. If the standard were somewhat higher our permissible overrun would be lower. Similarly with the higher solids in the mix we have in each case the highest permissible overrun that we could get with those standards. You see that the overrun permitted by such standards would be proportioned by the nature of solids in the mix, and still it would be placing a definite standard on ice cream in regard to the substance contained in it, and we would fix the limit so we would be preventing excessive overrun, which would be at the expense of quality.

In inspecting these figures we find a mix with 35 per cent solids would have a permissible overrun of 93.6. If we increase the solids 1.7 pounds per gallon the permissible overrun would be 82.2. It is probably in this neighborhood, 1.6 and 1.7 that the figure would have to be placed. My object is to place this before you. It will probably be forced upon you outside of the industry if you do not adopt it in the industry. It is an idea that has been advanced, and with the agitation of our food products in general undoubtedly a better standard in ice cream will come up. For that reason I have offered the suggestion. The amount of fat, as a suggestion I would say would be 30 per cent of the solids. If we require 1.6 solids per gallon and 30 per cent of that fat, or a figure might be placed at some other value. The actual figures are not the important things, the principle involved here is the principal thing. The figure is a matter that can be decided best by weighing the subject. After leaving with you these figures I leave the question for your consideration.

Chairman: This concludes our program for this afternoon. The banquet will be served in this room at six

THIRD SESSION.

Friday Morning, 10:00 O'clock.

Meeting called to order by President Smith.

Chairman: We have with us this morning Mr. W. H. Sprague, Chief Field Revenue Collector, on the subject of the Ice Cream Tax.

* * *

THE ICE CREAM TAX.

By Mr. W. H. Sprague, Milwaukee.

Mr. Chairman, I can't help but think your progressive Secretary ordered ice cream weather for this time of year. It is certainly exceptional.

I have been sent over here by the Collector, Mr. Bert Williams, to talk to you this morning of the ice cream tax. Of course, this season of the year the Internal Revenue service is largely centered in income tax, and it is a little relief to get away from that side of the work and talk on the phases of the law such as this. My intention is to talk to you briefly on this tax, to tell you as clearly and directly as I can where the tax applies and where it does not apply, because I know you, as manufacturers of ice cream are continually haunted by the dealers to know what shall we do, shall we not collect this, shall we collect this, and I want, if possible, to carry through you to the dealers in Wisconsin information which is authentic and which is based on the latest rulings from Washington on the law and on the regulations. I don't want to be technical, I want to talk to you as clearly and as plainly as I can, and after I finish what I have to say if you have questions I will answer them.

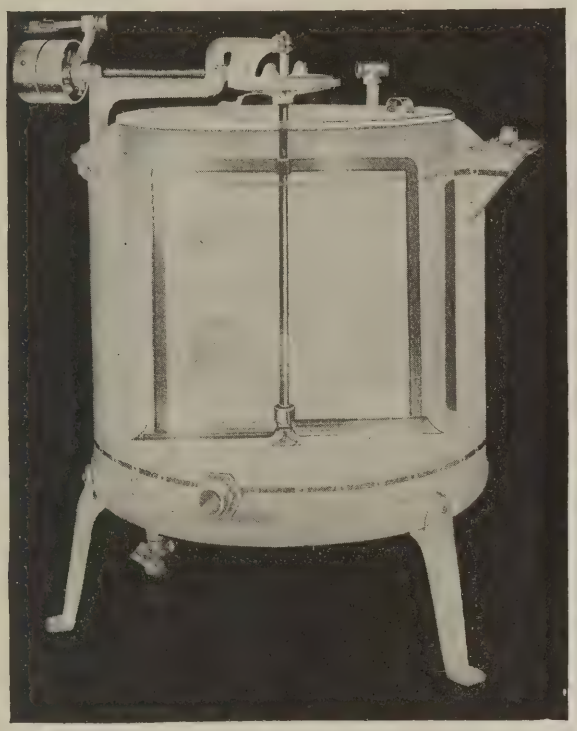
The section of the Revenue Act of 1918, which became effective May 1, 1919, covering the ice cream tax is all in one sentence. That one sentence is Section 630, and reads as follows:

"That on and after May 1, 1919, there shall be levied, assessed, collected, and paid a tax of 1 cent for each 10 cents or fraction thereof of the amount paid to any person conducting a soda fountain, ice cream parlor, or other similar place of business, for drinks commonly known as soft drinks, compounded or mixed at such place of business, or for ice cream, ice cream sodas, sundaes, or other similar articles of food or drink, when any of the above are sold on or after such date for consumption in or in proximity to such place of business."

In the first place I want to say I believe a good deal of difficulty and misunderstanding, as far as this tax is concerned, is due to the fact they have tried to crowd too much in that one sentence. We have a regulation 53, which is available to every dealer by application to the Collector's office, which discusses the application of that one sentence to the trade. I have had charge of the field work here in Wisconsin for the past three years and in that time, of course, we have had the work of enforcing the law as far as this is concerned, and I know from my experience this tax is one of the most unpopular taxes on the books to-day. It is unpopular because of two reasons. One, because it requires records to be kept by the dealer, and the other because it taxes particularly the children of this country. Those are the two things I Ifind causing this tax to be unpopular.

We have dealers to-day, a large majority of them, who are in business of a size they keep records of accounts who are keeping track of this tax as it should be taken care of, but you, as manufacturers, know there are a large number of dealers who keep no records whatsoever, and there is where the difficulty in enforcing this particular law comes in. In spite of that difficulty we have forced a large number of fellows the past year to pay this tax and to collect it, and we are continuing to do that very thing because we have to do so until Congress takes it off the books. Remember, at no time is a man allowed to refrain from collecting this tax until Congress says so. We have no such authority. The Commissioner of Internal Revenue at Washington has no such authority. Congress is the only one that can stop the collection of this tax. Last summer, through the papers, there was an attempt to get Congress to repeal this section. Some of the smaller dealers read those articles and believed this tax had been taken off and stopped collecting it whatsoever. Of course we had to go out and tell them they had to collect it.

I will speak briefly of the application of that tax. The tax, as you see by that section, is one cent on every ten cents or fraction thereof of the amount paid to any person conducting a soda fountain, etc., and on each sale. Those are the two fundamental things to remember. If one party comes in and buys three taxable dishes of ice cream and he, in bona fide payment not to evade taxes, but pays for that tax, then the tax is on the total amount of the sale, but if three people come in and buy separate dishes of ice cream, the price is on the separate sale. The basis of the tax is the price for which the commodity is sold. If a dish of ice cream sells for fifteen cents the tax on that is 2 cents. If somebody goes in and buys three dishes of ice cream at 15 cents, he will be taxed on the basis of 45 cents, or a total tax of 5 cents. On the other hand if three buy separate dishes of ice cream their tax will be 6 cents instead of 5. So much for the study of the tax rate.



I want to tell you what is the custom under the law. Bulk ice cream sold in containers to be taken away from the place of business and sold bona fide as bulk ice cream is not subject to tax. Any attempt to camouflage and get away from payment of tax and try to make it a bulk sale, the government would not stand for that. The second case of exemption for payment of this tax occurs where religious, educational or charitable societies on special occasions sell ice cream. That is only the occasional instance where they hold church socials or church fairs, things of that kind they do not have to collect tax on those sales, but if a church goes to a county fair and competes with other people they have to collect that tax, because the tax is not on the religious organization, the tax is on the person that buys, so that your second exemption is only in the case of religious, charitable or educational organizations which sell ice cream and kindred drinks at occasional fairs, such as socials and church fairs, and things of that kind. If they compete with somebody else they have to pay the tax just the same as the bona fide exhibitor.

The third instance of the exemption is new. It is a law which came through a month ago, and it affects the sale of ice cream with table d'hote or a la carte meals at a restaurant or at a hotel.. Some of you gentlemen who may have followed this thing know a year ago in March the Treasury Department rendered a decision, 2990, and in that Treasury Decision they interpreted this law further than it had been interpreted before. In order to make it clear, in order to impress the duty of taxing on certain people who were not collecting it, that particular provision they said if any restaurant or hotel or like place of business sold ice cream with a regular meal, if they served it from a soda foun-

Some Commercial Facts About Gelatine

By PROF. A. D. BURKE of the Agricultural and Mechanical College, Stillwater, Oklahoma.

I WONDER how many of us really know our product? Ice cream to be made properly must be properly understood but a thorough knowledge of its composition involves an exhaustive study of each of the ingredients which go to make up its context. One of these is gelatine which is perhaps the material concerning which our ice cream makers know the least.

This article is composed of no new facts; it is not setting forth new ideas; it is not an experimental report. It is rather a gathering together of a great many chemical facts concerning gelatine which may be of interest to ice cream makers. The following therefore is the result of a perusal of over one hundred and fifty volumes of chemical works, which contained items, experiments, and general discussions of our best known and least understood ice cream stabilizer; "Gelatine."

In the first place gelatine is a colloid. We know little concerning colloids and yet gelatine is perhaps our most characteristic colloidal substance. Many definitions have been offered for the term colloid yet none has proven entirely satisfactory to all investigators alike. In a general way we may say that a colloid belongs to a class of substances which are non-crystallizable, and are so finely divided that they are capable of floating about in a liquid neither in solution nor in suspension and can not be recovered from a solution by separation with the finest filter. In fact a colloid when mixed with a substance which forms crystals has the power of preventing the substance from forming crystals. Indeed it is this fact which makes gelatine so eminently suited for use in ice cream making for it has the power of preventing milk or cream and likewise ice cream, from forming large curds in the stomach when acted upon by the digestive juices, thus rendering the material more easily digested and assimilated by the body.

Chemically gelatine consists of carbon, hydrogen, nitrogen, oxygen and sulphur all combined in different proportions, and quantities according to the material from which the product is made and besides these, gelatine usually contains foreign materials which enter in during the process of manufacture. Perhaps a good average composition for a characteristic high grade gelatine would be the following; carbon 49.5 percent, hydrogen 6.75 percent, nitrogen 17.9 percent, oxygen 25.00 percent, sulphur 71 percent and a trace of such impurities as copper, lead, zinc, sulphur, dioxide and sometimes arsenic. As a rule, however, arsenic is found only in minute quantities in the higher grades and these alone should be used in ice cream manufacture. Even then it is well for the ice cream maker to demand an analysis of the gelatine from the manufacturer.

Arsenic gets into gelatine chiefly through impure bleaching materials or through impure acids, or preparations of arsenic used in treating the bones or hides. Likewise lead and zinc which may be used as bleaching materials or preservatives are sometimes carried through the manufacturing process and appear as impurities in the gelatine.

Copper, another impurity sometimes found in gelatine gains entrance through chemicals used in its manufacture and may be found in more or less quantities, some gelatins containing an amount sufficient to be dangerous to health. In fact at least one chemist has found that the copper in a few samples has been present in large enough quantites to cause poisoning when the gelatine containing it was used to garnish meat. Hence another reason why only a high grade of gelatine should be used in ice cream making.

By chemical or bacterioligical means gelatine may be broken up into many different substances entirely unlike the original product. Acids, alkalies, enzynes, and bacteria all play their part in its decomposition. The bacterial effect on gelatine becomes especially evident if one allows a tube of a 5 percent solution of gelatine in water to stand undisturbed for two or three days at room temperature. The product will have become changed, in other words, liquified, by the bacteria present and will be found to have entirely lost its power of solidification if placed in a cold room. For this reason and also because of the fact that gelatine may contain an enormous number of bacteria, which are always to be avoided by the ice cream maker, it follows that here likewise is another advantage to be derived from using only a high grade of gelatine in ice cream making.

When gelatine is treated with formaldehyde an insoluble material known as formo-gelatine is formed which fact has been made use of in photographic work. Likewise if potassium dichromate be added to an aqueous solution of gelatine the material upon exposure to light becomes insoluble. Gelatine also insoluble in very cold water, containing a small amount of alcohol. It does not dissolve in ether, chloroform, or tannic acid. However, it is soluble in acetic acid and after a few hours becomes intensely sticky. In fact the writer by this method has made a splendid glue which could readily be used for pasting labels on boxes in any ice cream plant.

It has been found by one worker that gelatine when highly heated breaks up into three portions which he terms A. B. and C. The A portion is a crystalline substance, the B part is an oily product, and the C is composed mostly of watery materials. Furthermore other workers and the writer have found that a gelatine solution such as is used in ice cream making loses its gelatinizing power if heated to too high a temperature. At a temperature of about 140 degrees F. gelatine usually begins to lose some of its solidifying powers yet the loss is so slight as to be negligible. Indeed the writer has heated some solutions of the better grades of gelatine to a temperature of 170 degrees F before adding these to ice cream mixes without any noticeable detrimental effects. However, for ice cream making it is not advisable to heat gelatine to a higher temperature than necessary to insure a good solution with the mix.

The material which gives gelatine the power to solidify in solutions is known as "glutin" and the more glutin a gelatine contains the better the gelatine. Hence it is always advisable to secure a high grade product in order to be sure that only a small amount of impurities are present and that the glutin is in abundance, as it is partly due to the gelatinizing power of gelatine that ice crystals are prevented from forming in ice cream and almost entirely due to the solidification power of gelatine that ice cream containing it has good heat resisting qualities.

Furthermore a good gelatine contains only a small percentage of ash. An analysis of ten samples by one worker has shown that the average ash content of good gelatine does not exceed 1.5 percent and the better grades contain only a little over 1 percent.

A high grade of gelatine should likewise contain practically no fat. In fact if any fat is present it should occur only as a trace. The writer at present is working on a number of practical gelatine tests for the ice cream maker among them being a test for fat and out of an analysis of some 25 or more gelatine samples, only one showed more than a mere trace of fat.

There is yet a great deal more to be said regarding the chemistry of gelatine but time and space will not permit. It is only hoped that this paper has proven of some little benefit to the ice cream maker and the writer will be glad to answer any question which, to the mind of the reader, have been left unanswered in this article.

HE HAS THE SYSTEM.

The following is a portion of a letter received in our office from the General Manager, Mr. J. J. Schmidt, of the Cline Ice Cream Co. of Athens, Ohio.

Ice Cream Review, Milwaukee, Wis.

Dear Sirs:

Please enter our subscription for the Ice Cream Review for our Hinton, W. Va., office. We desire that our people keep posted on what is going on in the ice cream business, and The Ice Cream Review contains much valuable information. No ice cream manufacturer or manager who makes any pretense at being progressive can afford to be without it.

Respectfully yours,

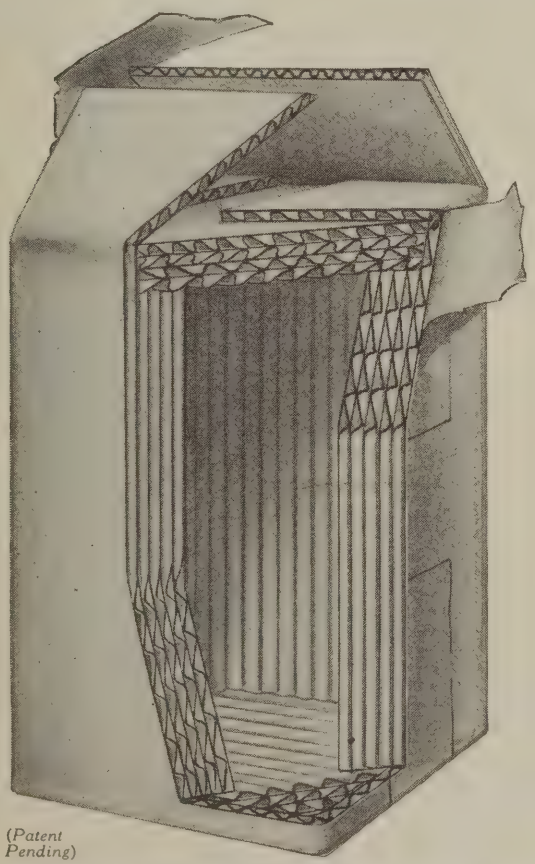
THE CLINE ICE CREAM CO.

(Signed) J. H. Schmidt, Gen. Mgr.

Conserve Your Profits
as the "Rush Season" Wanes

When the mad rush is over and capacity out-put has lost its affect on "that margin of profit per gallon," you will find these

Single Service
Ice Less Containers



a generous stabilizer of your "per-gallon" profit. Because they necessitate but "one" delivery—no calling for the empties.

Filled direct from freezer you gain the maximum overrun.

No Ice—No Washing—No loss of equipment. All items on which you can save by the use of these containers.

(Patented)

(Patent Pending)

Absolutely Sanitary Package

will keep ice cream in same condition as when placed in container from three to four hours.

Just the thing for Parties, Dances and Family Gatherings

Try a hundred of these containers, their price is reasonable. We will gladly tell you of ways in which you can use them to promote fall and winter trade. Write—

Quality Gelatine Pays

By L. O. THAYER, Director of Sales, Delft Gelatine.

FOR 25 years ice cream manufacturers have used gelatine. They will be using it for years to come, but with a better understanding of its necessity and qualifications. Up to recently few manufacturers, comparatively, knew just what gelatine was actually for. They imagined that anything gluey would do just as well and purity, quality and strength were not sought after so long as the price was low.

The last two years have seen more appreciation of real quality gelatine than in all its ice cream history. More top grades of recognized best brands have been sold than ever before. The present season has seen an anomaly in buying. With prices made high by tne war conditions, and with every incentive to seek out cheap goods in order to add a bit to profits, more ice cream manufacturers have resolutely put aside the price question and have bought gelatine on analysis. With a buyer's year low grades, and consequently low price goods, have been a drug on the market, and every gelatine manufacturer has disposed of more top grades than ever before. The reason is that ice cream men are testing gelatine and buying after a thorough analysis.

With gelatine costing as much as it is, and the prices have dropped 25 per cent since last fall, the manufacturers have discovered that money is to be saved by buying top strength grades and using less of it. The gelatine bill of a big manufacturer is something startling, and the wise ones are finding that if 2½ to 3 ounces can be used instead of 4 to 6 ounces they can better afford to buy the best and cut the amount used.

In talking with a manufacturer who is known the country over for astuteness, he admitted that all these years he did not know the true value of gelatine and how to use it to advantage. He of course knew that gelatine was a good binder and stabilizer, but he never realized the dietiary value.

While many dieticians regard gelatine as a food it is not so regarded by the more expert. Gelatine will not build tissue, but its food value is in saving the proteids in other foods and preventing the waste of time in the assimilation by the stomach. Probably there is no other substance that is so easily digested as gelatine. As a source of heat and energy it is equal to any proteid or carbohydrate. It has almost equal value to sugar in this respect. It saves from destruction half its weight of porteid, being twice as effective as any carbohydrate.

While ice cream is called an easily assimilated food it really is not so well qualified in that respect as imagined. The sugar helps to make it assimilate without extra work by the stomach juices, but the gelatine doubles the assimilating qualities. So ice cream made without gelatine loses a good part of this highly desirable quality.

Butterfat and casein, making up a large proportion of an ice cream mix, are rather hard to digest; condensed milk adds to the time of digestion. As said before the sugar helps, but the gelatine should be credited with more than one-half the easily assimilating qualities. So gelatine is necessary to ice cream for this if for no other reason.

While many careful ice cream men have advocated gums on the point of purity because up to recent years most gelatines were not considered over pure, the time has gone by when any such argument can be used. Gelatines made today by most concerns are far purer than ever before. Just because a gelatine is said to "meet" all pure food laws that is no great recommendation of purity. What careful manufacturers want is a gelatine that "beats" any pure food law in the matter of purity.

From the ice cream man's viewpoint heretofore the chief qualification of gelatine was a stabilizer. He knew that whether his ice cream was rich or lean a hot day would play havoc if the cabinet was not kept iced properly. Reports would come in that his ice cream was not standing up or that it was "sandy." If he was using a weak gelatine or none at all, this complaint is bound to happen. For years no remedy was known, and is not today in hundreds of plants. If any one will use the strongest gelatine he can find in sufficient quantity—not over 4 ounces to the batch—he will avoid all, or nearly all, such complaints.

Many have regarded gelatine as furnishing viscosity. While it does to a certain extent, that is not its function. Viscosity is provided by aging the mix, far better and more efficiently than any amount of gelatine that might be introduced. As a binder gelatine binds the sugar, casein and fat with the water to make a creamy mass, from which the water will not separate easily. If the water separates the low temperature will cause icy particles to form; that's "sandy" ice cream. Now gelatine is a peculiar colloid. Drop tiny pieces of ice into a cooling solution of gelatine and when taken out it will be found that tne icy particles have a film evenly covering them. Pass the finger over even where points can be seen and one will find no sharpness, but a smoothness that is surprising. That's just what happens to ice cream in a cabinet; the gelatine has formed a film around the icy bits. We might call it an iced capsule.

In the manufacture of capsules which are designed to cover medicine one of the chief requiremnts is strength. The gelatine must be strong enough to form a very thick film and be strong enough to hold its shape and not dissolve quickly. One of the biggest concerns in the world making capsules has determined that there is one superior brand of gelatine suitable for its purpose, and that is Delft.

From many experiments and much study the writer has proved that ice cream needs the strongest gelatine possible in order to prevent "sandiness." With all the mystery and floundering by some manufacturers about the subject of "sandy" ice cream there is a sure way out. The writer knows that a certain strength gelatine will even form films around milk sugar crystals, the very thing that causes "sandy" ice cream. Why do not these troubled souls make a few gelatine experiments and give over buying low grade gelatines because they are cheap. They might as well throw money away as to expect to have a satisfactory colloid from weak gelatine.

Another thing still little realized by ice cream men is that strong gelatine will make for uniformity of composition of the ice cream, and that it will preserve the creamy texture. An ice cream with no colloid cannot meet these desirable points if kept more than 12 hours. No colloid will preserve these qualities more than 24 hours except a good strong gelatine. Even a large amount of egg whites will not. The thinner the ice cream the more necessity for strength of gelatine, and the more should be used.

Now the strength of gelatine is a closed book to the ordinary man. Many there are who think they can use 8 ounces of gelatine to the batch and get the same results as 3 ounces of a grade that sells for 30 cents more a pound. It is a mistaken idea. Inherent strength counts more in gelatine than anything else. The strongest will form a film around an icy bit several times thicker than the weakest gelatine. The thinner and weaker the film the quicker it will be overcome by the moisture and disintegrate. Then you have "sandy" ice cream.

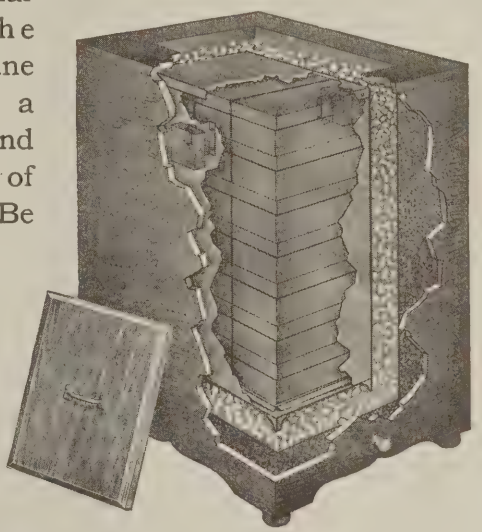
One of the most important studies facing the ice cream manufacturer today is that of gelatine and a series of authoritative articles should be written upon this subject. It would be thrilling and save fortunes to the industry.

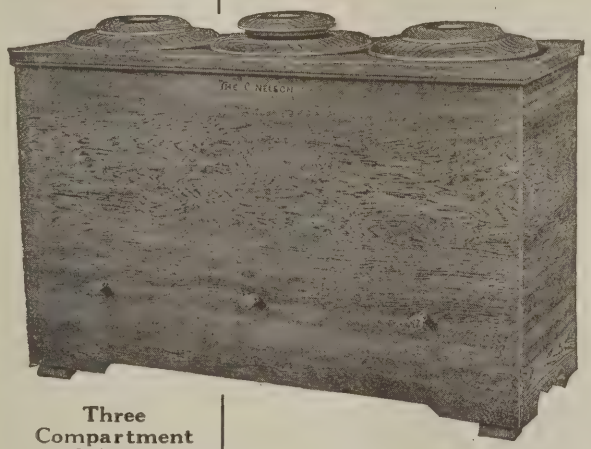
THE ASSOCIATION OF ICE CREAM MANUFACTURERS OF NEW YORK STATE.

Judging from remarks heard throughout New York State there are not going to be any ice cream manufacturers left here during the National Convention of Ice Cream Manufacturers and the National Dairy Show. Everyone is looking forward to the beautiful trip to Minneapolis and plans are well under way for special trains to carry the eastern manufacturers to Chicago there to join the larger groups enroute to Minneapolis.

While we are planning on a very pleasant trip to and from Minneapolis we are not unmindful of the very valuable information which we are able to get at our National Convention, and this coupled with the wonderful exhibits of the National Dairy Show makes the trip highly instructive.

A. M. LEMESSURIER, Sec'y.





Nelson (Patented Ice Cream Cabinets

"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

Patented May 8, 1906

Three Compartment Cabinet

42 Qt. Brick Cabinet with Ice Rail

Patented Nov. 11, 1919—1321120

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Plan on your season's requirements now, and have your supply on hand when needed.

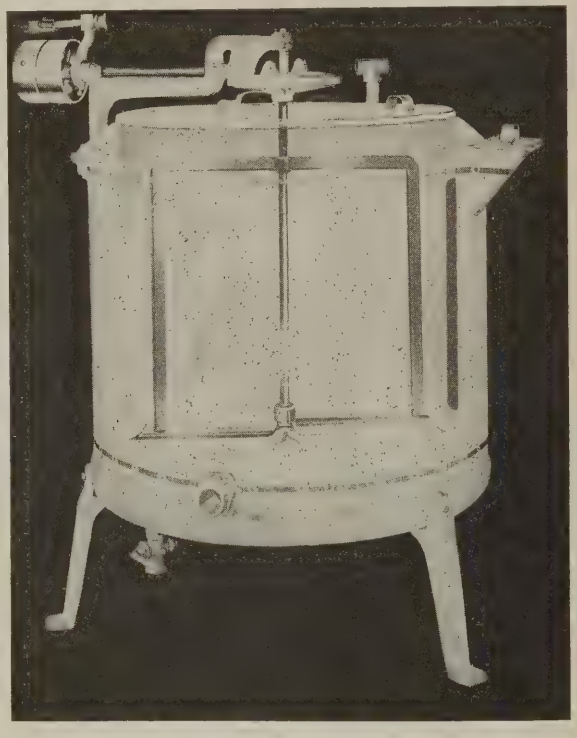
The Preparation of Gelatine

From BULLETIN No. 2003 of J. G. Cherry Company



THE use of gelatine by manufacturers of various food articles and products has been increasing steadily in recent years. In addition to its use in the manufacture of ice cream, it has become a commonly used ingredient in the manufacture of icing, icing powder, ice cream powder, marshmallow powder, candies, jellies, jams, fruits, juices, and dozens of other industries.

The rapidly spreading use of gelatine and the increase in its use by manufacturers accustomed to it, has naturally attracted attention to its proper handling in the processes of these manufactures.

There are several essentials in the successful use of gelatine. The first is an absolute dissolution of the gelatine granule. This, the first step in dissolving gelatine, consists in soaking it in clear cold water, preferably distilled. For this purpose water to about double the weight of the gelatine should be used and allowed to stand for fifteen or twenty minutes. This is sufficient ordinarily to permit the gelatine to absorb the water and at the end of this period it will be found that the gelatine is in a semi-jellied form in which it will respond readily to a higher temperature.

It must never be forgotten that gelatine dissolves when heated and congeals when exposed to a low temperature. But, in dissolving gelatine, it should at no time be heated over 150 degrees Fahrenheit and should never come in contact with direct heat. Overheating or boiling gelatine destroys its jelly and adhesive powers.

The second essential in the use of gelatine is a thorough agitation before joining it with the mix of which it is to be a part. Agitation is essential because without it a thorough emulsification of the solution cannot be properly obtained.

Cherry Gelatine Melter.

In the manufacture of ice cream, for instance, it has been discovered that after the gelatine has absorbed the water and has been heated properly to 150 degrees Fahr., it is ready to be assimilated by the mix. But this is most successfully accomplished by taking five or ten per cent of the mix, joining it with the dissolved gelatine, first bringing it to the same temperature as the gelatine and thoroughly mixing both together. This gives the manufacturer of ice cream a gelatine size which will thoroughly blend with the cold cream and eliminates the possibility of congealing the gelatine as it comes in contact with cooler temperature. Incidentally this also prevents the gelatine acting as a filler instead of as a binder.

From all the information heretofore published on the use of gelatine in manufacturing ice cream and other products it is readily perceptible that the primary requisite of the process is a machine or device that will present five important features:

1. Absolute temperature control.
2. Uniform temperature throughout.
3. Thorough agitation to secure emulsification.
4. Perfect sanitation.
5. Convenience in operation.

The necessity for the use of a machine to handle these operations is readily apparent. This has naturally attracted the attention of manufacturers to the needs of ice cream makers and other users of gelatine. Particularly has it attracted the attention of the J. G. Cherry Company to the need for the development of a machine which will handle gelatine perfectly so as to give manufacturers using gelatine an entirely satisfactory machine for their use.

Temperature control, the first essential to the user of gelatine is secured in the Cherry gelatine melter through the use of a water jacket into which steam is introduced under the control of the operator. At no time is it possible for live steam to come in contact with the gelatine or mix within the machine. This is true because it is a three wall machine. The outer jacket is of heavy galvanized iron within which is a lining of copper backed by a layer of asbestos which assists in the control of temperature, within which again is the water jacket space and finally the inner lining which is also of heavy copper. The picture shown on this page illustrates the construction of this machine, clearly demonstrating its capacity for maintaining absolute temperature control throughout its operations.

The same diagram shows how it is possible to obtain uniform temperature throughout the mix in the use of this machine. The steam connection is at the top of the machine. When the water in the jacket reaches the desired temperature the steam is shut off or reduced to a volume which keeps the water, and consequently the contents of the inner jacket, at a uniform temperature.

Given these two essentials to begin with, temperature control and uniformity of temperature, the greatest remaining necessity is thorough agitation. This is secured by means of a dasher and a baffle plate. The dasher is unique in that it is fitted with a lifting plate on the lower arm. This raises the heavy ingredients which ordinarily settle to the bottom and is a decided feature in securing thorough agitation. This desired result is further insured by a baffle plate set vertically at the side of the inner mixing jacket. With the dasher agitating the contents in a circular direction the baffle plate offers a resistance to the mix immediately next the wall of the container for its full height. This gives an additional emulsifying process to the mix and makes perfectly certain the agitation so essential.

Sanitation is assured by the fact that the entire process is conducted within a thoroughly covered device of which every part is removable and cleanable.

The melter is equipped with tight and loose pulleys and a high back gear fitted with gear guards. This permits of driving it from a pulley on a line shaft. There are no stuffing boxes on this machine, there being only one small cone, at the bottom, on which the dasher rests.

Stimulate the Carry Home Habit With Sealright Paper Containers

Fill Direct from the Freezers

THE result—a neat, attractive, air-tight, sanitary, easy and safe carry-home package for bulk ice cream that people like to carry. There is no dripping. Cream keeps in perfect condition for a considerable period of time. Most people prefer bulk ice cream. Employ the proper packaging method to harmonize with this preference. Fill Sealright Containers direct from the freezers. Save time and labor over the expensive brick method, enable your dealers to give quicker and more efficient service, and, most important of all, use the kind of container the public like to carry and have always wanted.

C.E. Rogers DETROIT

Automatic Brick Maker

1200 to 1800 Per Hour

THE Rogers rotary machine will fill from 1200 to 1800 Neapolitan or solid-flavor bricks per hour—ready for the hardening room. The Neapolitan bricks are mechanically and accurately portioned, the dividing line between flavors being sharp and straight. With a special conveyor the filled boxes can be carried directly to the hardening room at the same speed of the machine.

The labor-saving effected by this machine is remarkable. Only two people are required—one to feed the empty boxes into the machine and another to put the covers on as the filled bricks pass by on the way to the hardening rooms. By the use of a paraffined carton extra wrapping is eliminated. The carton covers, or tops, carry the brand name and decorative colors on five sides, making the package unusually attractive. When this package is opened by the consumer the cover is removed, the ends of the container are easily detached and all sides are turned down, leaving a perfect brick, free from muss, ready for the cutting knife.

In making Neapolitan bricks the three flavors pass from the freezers directly into the hoppers of the machine. This can be accomplished by gravity or in any manner best suited to your freezer arrangement.

A Rogers brick maker has been in practical operation in a large Detroit plant during the 1921 rush-season—and under constant and critical observation for the purpose of ascertaining the slightest defects in operation and utility. It is only after the most thorough tests, under rush-season and rush-day pressure, that we are prepared to announce a mechanically perfect machine backed by a Rogers guarantee of performance.

The machine occupies a floor space of 5' 8"x10' 1" and is 5' 5" high. It is mounted on wheels, being portable and easily pushed aside after the run is completed. (The accompanying illustration of the Neapolitan brick is from an actual photograph and shows the straight-line flavor divisions.)

SECRETARY WALLACE PRAISES WORK OF FORMER DAIRY CHIEF.

In accepting the resignation of B. H. Rawl, who recently resigned as Assistant Chief of the Bureau of Animal Industry, U. S. Department, to take charge of the educational work of the California Central Creameries, Secretary Wallace wrote Mr. Rawl:

"I have accepted your resignation, effective June 6, with a great deal of regret. I have long known of your work in the department, and, during the past three months, have come to have even a better appreciation of the valuable service you have rendered here. We can ill afford to lose men who are capable of doing the sort of work you have done, but I realize the attractiveness of the opportunity which is open for you and of the obligation you have to your own people.

"Your constructive leadership in dairy work in the South, your vision and guidance in establishing and conducting the experimental factory at Grove City, Pa., your effective direction of the organization of cow testing and bull associations, your special research studies in breeding and feeding and in manufacture, all have contributed very greatly to promoting the dairy industry on sound lines.

"Dr. Mohler, the Chief of the Bureau of Animal Industry, speaks in very high terms of your work as assistant chief of that bureau during the last two and a half years and, as indicated above, I wish you might be continuing with us in this service.

"I am sure I can speak as well for your associates here and for the great host of people outside whom you have served so helpfully.

"I wish for you the greatest measure of success in your new undertaking."

MILK AS A CURE-ALL.

The discovery that certain foods, such as the fat in milk and egg yolk, in green vegetables, contain substances, called vitamines, that have a direct relation to growth in the young, both physically and mentally, is opening one of the greatest fields of scientific and medical research that has confronted the scientific world. Not only in our own country, but in European countries the vital importance of foods carrying these vitamines is being followed up with the deepest interest.

As a result of these investigations we are getting at the bottom of a number of diseases that have before baffled medical science. Scurvy, beri beri and rickets are now conceded to be due to the lack of these vitamines in food. Leprosy is a malady that is still a mystery to medical science, although it has been suggested that it may have a relation to improper nourishment. It is worth noting that it does not afflict races that are liberal milk consumers.

The thought that comes to us in relation to these serious diseases that may be overcome through the consumption of vitamine bearing foods is whether many minor diseases and troubles are not due to the same cause. Headache, rheumatism, liver trouble and a multitude of other ills,—may they not have a relation to the fact that our bodies are not provided with an element in our food that we now know is essential to promote growth in young persons and animals? Indeed, the more you think on the subject the more are you convinced that milk, the richest of all foods in vitamines, is about the nearest cure-all that the Creator has given to man.

We Told You So!

As we predicted, Fancy Cream Work is having a record-breaking run this Summer. And Reyam Brand pure food products are "doing their bit" to contribute toward this phenomenal success. In making the following choice creams, use the items recommended—but be sure they are **Reyam Brand.**

For Fresh Fruit Peach Ice Cream and Ices
use Cold Process Crushed Peaches.

For Fresh Fruit Strawberry Ice Cream and Ices
use Cold Process Strawberries.

For Raspberry Ice
use Cold Process Red Raspberries.

For Orange-Pineapple Ice Cream, Ices, Sherbets
use "Orange-Pineapple" (Crushed).
The season's biggest hit!

For Cherry Cream, Bisque and Ices
use "Whole-and-Broken" Maraschino Cherries or Crushed Maraschino Cherries.

For Tutti Frutti Ice Cream or Mixed Fruit Ices
use Tutti Frutti Mixture, ready for instant use.

For Pineapple Ice or Sherbet
use Crushed Sweetened Pineapple or Unsweetened Crushed Pineapple in No. 10 cans, No. 2½ and No. 2 cans. Or Unsweetened Pineapple Juice in No. 10 cans.

For Lemon or Orange Ice
use Lemon or Orange Emulsion.

For 3 New Fancy Ice Cream Specialties
use Cocoanut Fruit Salad, Raspberry Swissette, Peach Swissette.

SANISCO CO. MILWAUKEE WISCONSIN

Imperial Ice Cream Company, Wheeling, W. Va.

By WILLIAM D. McCORMICK

The Imperial Ice Cream Company, whose headquarters are located at Clarksburg, W. Va., operate more ice cream plants and do a larger business than any other concern in the state of West Virginia.

This particular state does not enjoy the equal climatic condition that many other states have, for West Virginia has the greatest diversity of climates of any state, caused by the numerous mountain ranges and the great variation of altitude. The average altitude of West Virginia is greater than any other state east of the Mississippi river, it being 1,500 feet. In the mountains a Canadian climate prevails both summer and winter, while in some sections of the state the winters are mild and the summers very warm. Operating a chain of plants in this particular state would naturally encounter difficulties with this climatic condition.

WILLIAM D. McCORMICK

Their original plant was located at Parkersburg, W. Va. The business was originally started by W. M. B. Sine in partnership with his uncle, A. G. Sine. From a very small beginning this Parkersburg plant increased its production and its shipping business on the main line along the Baltimore and Ohio east until it was necessary, in 1913, to erect a plant at Clarksburg, which is the present general office and main plant.

Clarksburg is not a large city. It has 13,000 people, and if an ice cream plant was to do a large volume of business at all it became evident that the two branch lines that connect with the Baltimore and Ohio main line must be intensively cultivated. These sales conditions were met and answered and to such an extent that the Imperial Ice Cream Company at this particular plant do 90 per cent of their business in tub shipment.

Under the careful management of Mr. W. M. B. Sine the business in this territory was so developed that it was necessary to erect a plant at Cumberland, Md., in 1916, to relieve the eastward expansion of the business from the Clarksburg plant.

Prompt and efficient service that will insure this company's customers having cream when they want it caused them in 1918 to erect a plant in Fairmont and in 1919 a plant in Grafton, both cities being in the neighborhood of Clarksburg.

Wheeling was next selected as the logical point of expansion that would relieve their Parkersburg shipping along the Ohio River Division of the Baltimore and Ohio railroad.

This particular city has the largest population of any city in West Virginia. It is situated in the Panhandle section of the state. The greatest number of manufacturing establishments, or forty-one per cent of the state's total number of manufacturing establishments, is located in this district.

With the 80 miles of electric railway system to the suburbs of Wheeling and the neighboring city of Bellaire, Ohio, across the river brings the population up to over 80,000 in the immediate vicinity of Wheeling.

The city is a natural location for a modern up-to-date ice cream plant. For many years the business has been divided between the Kloss Ice Cream Company and the Blake Ice Cream Company, both plants were purchased and the two being merged formed a nucleus of a business start in this West Virginia metropolis.

In view of the methods and manner of conducting their business, it was not thought practical to operate the Wheeling branch of their business in a plant which would not bear comparison to the modern methods of handling and manufacturing ice cream that form part of all their other plants. Consequently, the city was canvassed to find a piece of property that would be suitable to erect a new building.

The typography of the city is notoriously hilly and a level piece of property is practically impossible to buy, particularly for manufacturing purposes. The piece of property finally selected has considerable rise from the

The Home of Wheelingites' Favorite Dish.

One of the Battery of Hardening Rooms.

When the Sun burned and the wire sizzled—

WHEN every customer seemed to be 'phoning at the same time, did old fashioned ripening methods force you to fall behind in either the quantity or quality of your product?

During the hot weather rush hundreds of leading manufacturers again demonstrated that full ripening can be accomplished in hours, instead of days. They used Gumpert's Ice Cream Improver to aid and quicken Nature's processes.

Gumpert's Ice Cream Improver not only produces ice cream faster—it makes a richer-tasting, smoother product, and gives an additional over-run.

There's more hot weather in store—more than 2000 manufacturers will be prepared for it with Gumpert's Improver. Will you?

S. GUMPERT & CO.
BUSH TERMINAL BROOKLYN, NEW YORK

GUMPERT'S *Ice Cream Improver*

front towards the rear. The alley in the rear being level with the second floor at the front of the building. The Baltimore and Ohio passenger station is just two squares from the plant, which makes the site selected particularly advantageous for shipping over this railroad. For city business the location is practically in the center of the city.

The McCormick Company, Inc., were selected to prepare the plans and a quick start was made, but the grades of the property soon developed into many difficulties to be overcome, if the operating arrangement was to be economical in every department throughout the plant. W. M. B. Sine, himself, spent day after day in conference with his architects analyzing and eliminating one scheme of arrangement after another until finally the present layout was developed and a modern concrete plant was erected and completed on time to start the 1921 season.

The exterior of the building is severely plain, but substantial; red face brick walls with concrete columns and girders exposed. The building being on a grade that rises gently towards the rear, making the basement floor level with the main street and the first floor level with the street in the rear.

The main street floor contains the refrigeration equipment, which are three 9x9 units York high speed, motor driven machines. The brine tanks and all brine

Waste of Valuable Space Is Eliminated by Careful Arrangement of Machinery.

pumps are located on this floor. A steam boiler plant to provide pasteurizing steam and low pressure steam heating for the building is located here.

A service staircase in the rear of the engine room leads to all floors in the building. At the front of the building one enters the offices and through an office staircase directly from the street.

One characteristic of this plant and all plants of the Imperial Ice Cream Company is the absolute utilization of every square foot of space. You will never find a square foot of space in their buildings that is not put to use. Every building is so designed that future expansion can be built on to it later, and no investment is tied up depending upon future expansions that could not be accurately determined when the plant was originally laid out.

As a result of this building policy, you will find their offices, while not exceptionally large, yet comfortable and efficient. There is the manager's private office, a reception room, general office and order department with the necessary office toilet rooms. The order department leads directly to the shipping platform which insures quick service for shipping.

An ice cream manufacturer once visited the Imperial Ice Cream Co.'s plant and, as Mr. Sine stepped into the manufacturing department with him, he asked him "to judge it as not built for beauty but as a practical work shop to produce ice cream," and this is how you must judge the Imperial Ice Cream Co.'s plants as you go from one manufacturing room to another.

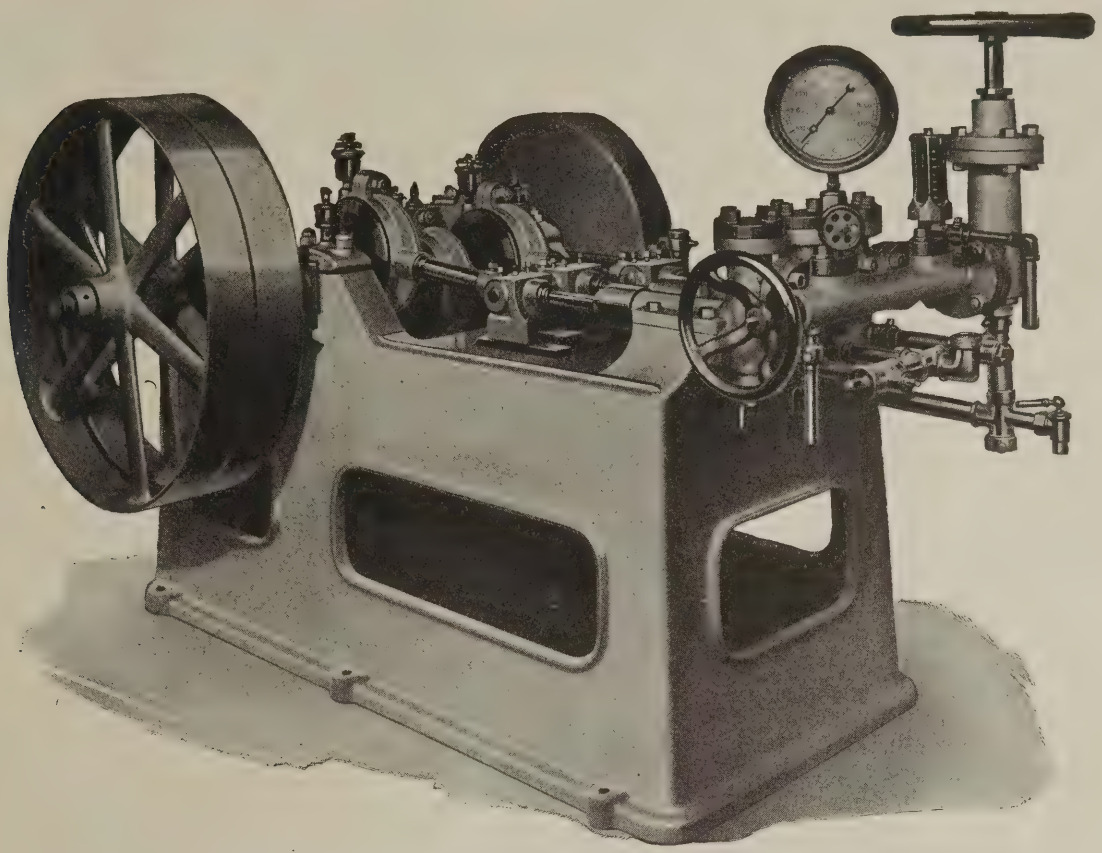
Every piece of building material used was put there for permanence. There is no cheap or make-shift materials that will not stand the wear and tear of an ice cream plant, but at the same time no money was spared to make the plant thoroughly sanitary, well ventilated, and economical to operate.

Every room has a clean, inviting appearance and you will notice the freezing room seems to be just exactly right in size and its white painted walls and ceiling give it an elegant appearance and a very practical one. Six Miller freezers have been installed, a chef's buffet for extract, a paper cover case and mould rack. Their brick cutting is done right in the freezing room. This is something that Mr. Sine believes to be a thoroughly practical idea. He has tested it out in his plants and it does work satisfactorily. They thoroughly investigated the various phases of their business and they make it their business to know their building requirements.

A battery of hardening rooms with direct expansion shelves are immediately in back of this freezing room. There is a passing box and the freezers have their motor ends along the walls of the hardening room.

Plenty of Light Is Essential in Freezer Room.

From the freezing room the sterilized can storage room connects the can washing room where the can washer and dryer are installed.



The shipping platform is L shaped. The hardening rooms, order department, can washing room, lead up to the shipping platform. There is an ice and salt pile for country shipping and ample space for tub storage.

The second manufacturing floor contains the mixing or pasteurizing room that is very ample in size and has natural light through windows on three sides. Two Cherry mixers are installed in the pit, a homogenizer, tubular cooler and Elyria glass enameled tanks for storage form the equipment of this room.

This mixing room opens out to the service staircase, the elevator and cream refrigerator room. The doors are so arranged that they can be closed from the service staircase to prevent the annoyance of flies in summer time.

The ice plant is on the second floor, where raw water ice is made, stored in a very large ice storage room that is so arranged that part of the fruit storage room and sweet cream cooler can be used for ice if necessary. The ice, of course, drops by gravity to the tank wagons and ice platform below.

The third manufacturing floor, or the fourth floor, if viewed from the street, forms the storage rooms. A

Progress Homogenizer DH-4B, 400 Gallons

Principal Use Is in Ice Cream Industry

The principal use of the Homogenizer is, without doubt, in the preparation and treatment of ice cream mixtures. The ice cream manufacturer is no longer obliged to pay exorbitant prices for cream during the summer months when ice cream is in great demand and raw cream is scarce. Thanks to the development of the Homogenizer frozen cream can be stored during the plentiful period and converted back to its natural state when needed. Unsalted butter is also stored in large quantities and used by the ice cream maker as a basis for his cream. The Homogenizer, at a pressure of about 2,500 pounds, will restore the frozen cream or emulsify butter and skimmilk to produce a cream equally as good as the fresh product in flavor, body, and food properties.

Perhaps the greatest single use of the Homogenizer is for treating the ice cream mix before freezing. The ice cream batch is regularly heated to a pasteurizing temperature which thoroughly dissolves and mixes the sugar and other ingredients, and is then homogenized at about 3,500 pounds pressure. The great advantage of homogenizing the entire mix is that it makes the butterfat and solids go farther than would otherwise be the case. Since the solid particles are so finely broken up and uniformly distributed, they give the finished product a richer taste and a firmer body. An ice cream made from a homogenized mix will have a much better texture and will taste richer than an ice cream made from the same mix but not homogenized.

The exact treatment of ice cream mix is rather difficult to specify without knowing the individual conditions involved. The composition of the mix and the design of the machinery will greatly influence the temperature and the pressure to give best results. Where vats are used for mixing and pasteurizing, it is usually advisable to homogenize at the pasteurizing temperature of about 142° and directly from the vats. The action of the Homogenizer will increase the temperature slightly and the finished goods should be immediately cooled to 50° or lower and held until ready for freezing. The pasteurizing process will usually bring the mix back to its natural state so far as viscosity is concerned and, therefore, the addition of a starter or aging of the cream at low temperature, is necessary to obtain the desired body.

In large and complete plants where the mechanical equipment is available, it is considered advisable to pasteurize the mix at 142°, then heat to about 160°, and to pre-cool quickly to 120° on the way to the Homogenizer. This treatment gives the best possible bacteriological condition and a distinctive and pleasing flavor and excellent homogenizing results. It should be the object of each manufacturer to study his conditions carefully and to treat his mix in the best manner and in the same manner every day so that his product can always be distinguished by its flavor, texture and richness.

Those who are considering the installation of a Homogenizer may obtain full and complete information by addressing our Sales Branch in their territory.

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

special bin was built for salt to insure gravity flow to the platform below. There being only one other room and that being what is known as the broken-package storage which is adjacent to the staircase so that no time is lost to get the ingredients to the mixing vats which are directly below the foot of the staircase.

This plant is really a notable ice cream plant. While it is not the largest plant completed this year, yet it is so thoroughly practical and its construction and arrangement so simplified and all lost motion overcome by very careful planning, that it is certain to be a highly successful plant.

In the matter of new plants, which is in charge of Mr. W. M. B. Sine, the matter of buildings and equipment cost is very carefully determined before the plant is started. Once the financial program is laid out, the building cost must not exceed the appropriation and in the case of this plant, it did not.

The arrangement that the visitor sees when he visits this plant, and he is always welcome at the Imperial plants, is the final plan adopted after not less than 15 different ideas for the development of this parcel of property were laid out on paper.

When the plant was opened to the public in the middle of May, the Wheeling people responded to the opening to the extent that even the company's directors were surprised themselves. Crowds thronged to the plant on the opening day. The Barker, Duff & Morris Company conducted an advertising campaign, inviting the public to the plant that produced such astonishing results. A visitor is always welcome here. The city can be reached by direct sleeping cars from Washington, New York, Philadelphia, Chicago and St. Louis.

RESEARCH WORK ON INSULATING MATERIALS.

From Report of The Ontario Agricultural College.

About two years ago we started experiments in the laboratory to ascertain the relative insulating value of the several materials named below. The reasons for undertaking these tests were:

1. To get first-hand information, as we found that there was very little available data in regard to the relative value of these substances as insulators.

2. The information acquired and experience gained in carrying on the work would be invaluable in our lectures, and discussions on Cold Storage with the students.

3. The number of requests from farmers chiefly for such information was annually increasing. About this time we found that the beekeepers, for instance, were adopting the outdoor system of wintering their hives of bees in insulated cases, and they wanted to know what was the best material to pack between the cases and the hives in order to maintain the temperature in the hive at a suitable point.

Materials Tested.—The various materials tested were: Very fine black re-granulated cork, coarse black re-granulated cork, granulated cork (natural color) such as is used in packing material for imported grapes for instance, another grade of cork (natural in color) and similar to the preceding one but a little coarser in grain and lighter in weight, sawdust, planer shavings, chopped straw, forest leaves, and ordinary excelsior used in packing cases.

Results.—Briefly, we found that the very fine black re-granulated cork had the highest value as an insulator, i. e., it resisted the flow of heat through it better than any of the others. If we take it as the standard and assign to it a value of 100, the other materials arrange themselves as follows:

Chopped straw	86
Coarse black re-granulated cork	85
Forest leaves	84
Granulated cork similar to that used as packing for grapes	84
Granulated cork similar in color to preceding one but a little finer and lighter	80
Sawdust	68
Excelsior	60
Planer shavings	60

Properties of a Good Insulating Material.

1. First of all the material must be a poor conductor of heat, but there are other properties that must not be overlooked by any means.

2. It should be easy and agreeable to handle. The fine re-granulated cork is certainly a poor conductor, but no one would care to handle it very much, as it is extremely dusty and unpleasant. Any of the others would be better in this respect.

3. It should stand up well in the wall. Sawdust is a better insulator than planer shavings, but in actual practice the latter is superior since it is elastic and therefore does not settle in the wall and leave an open space at the top to let heat pass through.

4. It should be a poor absorber of moisture. Planer shavings are better in this respect than sawdust. If an insulation becomes damp it loses a lot of its value as an insulator, and, furthermore, will soon deteriorate and rot.

5. It should be reasonably cheap and easily obtainable. Such is the case with sawdust and shavings.

6. It should be durable and easily put into the wall. The various grades of cork are the best in this respect.

7. It should not be attractive for rats and mice, as they would soon destroy it. For example, chopped straw.

From most of these standpoints, the granulated corks are the best, but they are the most costly. Next to them we would recommend a good quality of planer shavings; next a good quality of sawdust, dry and from well-seasoned woods as basswood, and pine. Chopped straw and forest leaves would give very good results for a time, or while they would stand up. It will be seen that many factors besides insulating value must be considered before deciding upon material to be used in any particular case.

Some of the uses of these materials to-day are the following:

1. Insulating cold storage buildings.
2. Insulating milk or cream tanks.
3. Packing for beehive cases—useful both summer and winter.
4. Insulating ice storages and refrigerators, and for packing around ice in the storages.
5. Insulating fireless cookers.
6. Insulating water and steam pipes.

Anyone interested in insulating materials for any of these various uses should first write us giving the circumstances. We will freely give advice, not only as to the best material to use, but also the amount, i. e., in this case the thickness to be put into the wall.

P E N N A .

Has Your Ice Cream Character?

By H. W. BLACK, with The Widlar Company, Cleveland, Ohio

What can I do to make people demand my ice cream in preference to the other fellow's? This is the question that is occupying the attention of every progressive manufacturer in the country to-day. With the millions of dollars of capital lying idle in brewery properties in every populated community, it is quite natural that the established manufacturer of ice cream should be concerned about the new competition that is rapidly cropping up. Unless you are making the best ice cream that is humanly possible, you are only inviting outside capital to open the doors of a brewery with refrigeration machinery already installed.

H. W. BLACK

Unless your ice cream is so good that it cannot be improved, you are only inviting new competition to go out and take the business you have been years in developing, by giving the consumer an ice cream of better quality.

What then constitutes Quality? In other words, what are the most important component parts of good ice cream? They are the texture or body, the butterfat, solid content, and most important, the Taste. People will go past one store to buy ice cream at another, if the other man's ice cream tastes better.

The consumer is not particularly interested in whether one man's cream has a point or two more butterfat or if his solid content is 33 or 40 per cent, if the texture is good and the flavor is pleasing.

Therefore, inasmuch as "flavor" plays such an important part in the successful sale of ice cream and as 90 per cent of the ice cream consumed is vanilla, it behooves the ice cream manufacturer to be eternally on the lookout for a better vanilla flavor for his ice cream. The really progressive manufacturer to-day makes a practice of collecting samples of all his competitors' ice cream periodically and comparing them in an unbiased way with his own.

Try this sometimes. Get samples of the different ice creams that are sold in your community and a sample of your own. Have the dishes marked so you will not know which is which and then taste all the ice creams. Pick out the best flavored ice cream. If it happens to be your own, you can go to bed and get a good night's rest (if you are not too busy) but if it is the other fellow's, my best advice to you is to get hold of a good extract man who knows his business, and one in whom you can put absolute confidence. Lay all your cards on the table; tell him you want a flavor that will give your ice cream "individuality". Tell him that you want your ice cream to have "character" and that you want it so good that there won't be any possible chance of the consumer not being able to distinguish it from your competitors' when they taste it.

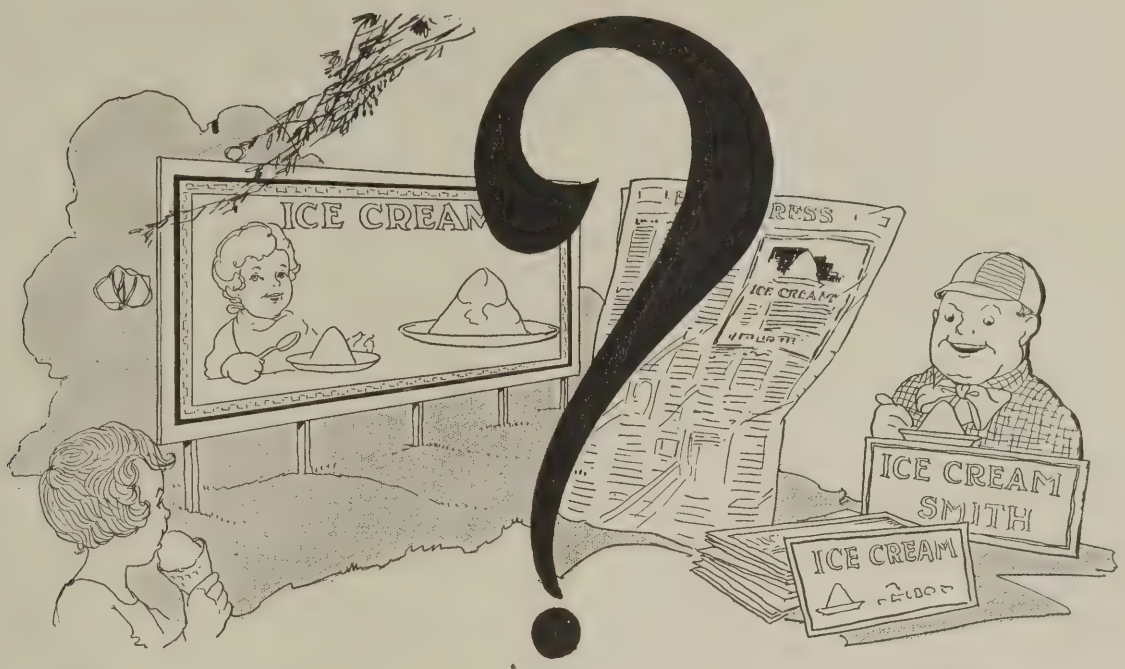
The phenomenal growth of the ice cream business is responsible for the fact that so many manufacturers do not give sufficient attention to the flavor of their ice cream. Too many men buy a barrel of vanilla with no more concern than they purchase a keg of tenpenny nails.

Some use vanilla as sort of a "necessary evil" and feel that they have to put it in their ice cream, so for that reason the cheaper they can buy it, the more money they will have at the end of the year. Then, again, there are some who buy a rank, harsh flavor "to cover up the off flavor of their mix," instead of determining the reason for "off flavor" and correcting it.

The most prevalent cause for "off flavor" in ice cream is in the handling of the condensed in such a way as to produce a cooked or scorched flavor in your mix. Another cause is the use of low grade, unstandardized gelatines. Another is the careless use of so-called "improvers".

Most "improvers" simply do, artificially, what nature will do automatically if you have the time. They ripen your mix. There is nothing finer than a sweet ripe apple, but when it is over-ripe, it is rotten. This also applies to your mix.

A short time ago the writer was in receipt of the following telegram:



"Something wrong with last barrel vanilla. Customers kicking. Please replace."

The next morning found me, after a hot night on a sleeper, at the plant "where customers were kicking." After a thorough investigation we found that they had run out of the high grade standardized gelatine that they had been using and had been forced to "pick up" a parcel from a local jobber. The gelatine proved high in acidity, their mix was just ready to turn, the result: sour ice cream, and, of course, the vanilla was blamed until we were able to put our finger on the cause of this man's trouble. It is needless to say that we made a satisfied customer of this concern and his appreciation to us has been shown by his continued patronage.

I could cite a hundred incidents but they would all point to the same conclusion,—namely, your vanilla salesman isn't such a horse thief after all. In fact, the chances are that he can help you sell more ice cream just as effectively as your advertising counsel, if you will give him the opportunity. The best flavor you can buy is just as good an "ad" as a hundred bill boards if you will have your solicitors continuously talk and drive home to your customers the superiority of your flavor. If your flavor is better, your ice cream must be better, **because it tastes better.** That is the logic of the ice cream consumer. When you find a vanilla that will give you the best flavored ice cream in your community, don't keep a secret. Let your bill boards, your window trims, your newspaper ads,—in fact, every advertising medium you use, tell the public how much better your ice cream tastes.

Try advertising the flavor of your ice cream instead of just ice cream and you will soon find that the consumer will go by several of your competitor's stops to buy your ice cream because your advertising has told them that your ice cream tastes better and the vanilla in your product has proven your statement.

The last taste in the consumer's mouth is what leaves a desire for another dish, or else causes him to mentally resolve to buy the other fellow's ice cream the next time. There is no reason why the extract

¶ Relieve you of all the detail connected with your advertising.

¶ Act as confidential advertising counsel.

¶ Confer with you on any Advertising and Selling Problem.

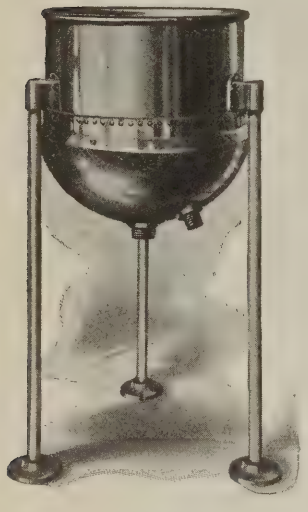
THERE are hundreds of ways of advertising—but only one method or combination which directly suits your business.

When the *correct* method is decided upon; when it is planned and carried out by specialists in Ice Cream Advertising and Selling, the effect is promptly noticed in increased gallonage and better dealer co-operation.

To decide—*with you*—upon the correct form this advertising should take—to provide the posters, dealer helps, newspaper advertising and other material required is the object of this organization.

Whether you invest $300.00 a year (as does one of our clients) or whether you use $100,000.00 (as does another) you are assured of the same intelligent service and enthusiastic co-operation.

If you are located in a territory we do not already serve our advertising service can be used with valuable results. Write for complete information and plan.



BARKER, DUFF & MORRIS
Ice Cream Advertising Headquarters
323 FOURTH AVENUE, PITTSBURGH, PENNA

manufacturer who will develop a real vanilla flavor with "individuality" and "character" should not be able to pick their customers in non-competing territories, the same as Barker-Duff & Morris Advertising Company pick their clients, because a flavor of this nature surely would be working night and day advertising the quality of their customer's ice cream.

In closing let me again urge that you stop buying extract from every Tom, Dick and Harry, make the man who sells you your vanilla give you the best flavored ice cream in your territory. Then standardize on that flavor and don't change, no matter how good a fellow the other salesman is, unless he has something still better. Don't spoil a perfect ice cream mix with an inferior vanilla. Get a flavor with "individuality". Will your ice cream then have CHARACTER? Try it, that's all.

⚜

CREPACO COPPER GELATINE KETTLES.

These kettles are made of copper with copper steam jackets surrounding the lower portion of the kettle. These are upheld by pipe standards screwed into flanges for fastening to floor. They vary in diameter from 16 to 26 inches and in sizes to hold 10 to 75 gallons. All sizes are equipped with quick opening draw-off valves. In addition to their use for cooking gelatine, they are ideal utensils for preparing fancy ice cream mixes and for modifying milk.

⚜

NATIONAL DAIRY UNION NOTES.

Washington, D. C., July 11, 1921—Dairy interests, dairy cattle associations and farm organizations have united in an effort to secure the enactment of "filled" milk prohibitive legislation, co-operative marketing laws and a proper and consistent tariff schedule. The agreement was reached at a meeting in Buffalo, July 8 and 9 attended by President Frank O. Lowden of the Holstein-Friesian Association, S. J. Lowell of the National Grange, Milo D. Campbell of the National Milk Producers, N. P. Hull, President of the National Dairy Union, H. E. Babcock, representing the Guernsey Breeders' Association and other representatives of the dairy and farm organizations.

The resolutions adopted were as follows:

By Chairman Campbell of the Committee on Filled Milk Legislation:

"Whereas, There is an alarming increase in the manufacture, sale and consumption of bogus milk products, consisting of compounds of skimmed milk with cocoanut oil or other vegetable fats, and

"Whereas, such products, regardless of the labels on the containers, are being sold in large quantities as Condensed Milk and other milk products, thereby at once becoming a fraud on the consuming public as well as a menace to the public health and to the dairy interests:

"Therefore, Be It Resolved, That we favor the abolition of such traffic by Congress by direct prohibitory or restraining laws.

If, however, it shall be found impracticable or impossible to effect such prohibition by direct legislation, we recommend and urge Congress to levy a tax upon such products high enough to measure the difference in cost between such bogus or adulterated products and the products of like character made of whole sweet milk. We also believe that a tax should be placed upon the manufacture and upon the sale both at wholesale and at retail of such bogus products. To become effective for the protection of the consuming public and of dairymen whose product is thus being deceptively and dangerously imitated, a tax should be levied of not less than three and one-half cents per pound on such bogus products."

Moved by Professor Erf, seconded by Richard Pattee that the resolution be adopted as read. Carried unanimously.

By Mr. Miller: "Resolved, That we re-affirm our approval of the Capper-Volstead Co-operative Marketing Bill, H. R. 373, and urge its early enactment into law in the form that it passed the House of Representatives."

Moved by Richard Pattee, seconded by A. J. Glover, that the resolution be adopted as read.

By Chairman Balderston of the Committee on Tariff Schedules: "Whereas, it has been distinctly and conclusively shown by data carefully compiled by competent authorities that a tariff of 10 cents per pound on butter was absolutely necessary in order that the dairy industry may prosper in the United States.

"Therefore, Be It Resolved by this Conference of the representatives of dairy associations assembled in Buffalo, N. Y., July 8, 1921—

1. That we respectfully urge upon Congress that the above mentioned rate of duty on butter be agreed upon in the final passage of the pending tariff law.

2. That we insist and urge all our constituent and allied interests to insist that the entire dairy product schedule must be on a parity with the rate of duty on butter. We approve the entire schedule suggested by the United States Milk Producers Dairy Tariff Committee, which was based on the comparative market value of the various constituents of whole milk and is as follows:

Milk, 3½ cents per gallon, cream 35 cents per gallon, butter 10 cents per pound, cheese 5 cents per pound, condensed milk 2 cents per pound, casein 5 cents per pound.

We would call attention to the fact that Casein has been overlooked by the Ways and Means Committee. The American Manufacturers of this by-product cannot exist without proper protection.

3. That any protection of the Dairy Industry may receive by a tariff on dairy products themselves, will be very largely negatived if there is not a duty on edible vegetable oils at least equal to the tariff on butter fat. We would urge that there be placed a tariff on Copra not less than 50 per cent of the rate of duty placed on vegetable oils. We also recognize the importance of these oils in the industries and arts and would suggest that importers and refiners be allowed a suitable rebate on all such oils that are denatured and used for any purposes other than human food."

Moved by Mr. Pattee; seconded by Mr. Holman, that the resolution be adopted as read. Carried.

A. M. LOOMIS,
Secretary.

Doubling Output without Hiring More Help

Prominent Philadelphia Ice Cream Manufacturer Orders 6—160-qt. Capacity

U. S. Heavy Duty Giant Freezers

IN A test made in the plant of a prominent Philadelphia ice cream manufacturer, a recently installed 160-qt. U. S. Heavy Duty Giant Freezer finished 9 batches in the course of a 2-hour period, and the tenth was in the making when the time was up.

Thereupon two more Giants were immediately ordered. After these were also installed, it was discovered that one man could just as easily keep the three Giants going at full capacity without interruption, as he could keep three freezers of another make, but of only about half of the capacity, going.

This was partly due to the automatic batch control and the remarkable ease and convenience in general with which these Giants can be handled.

It was also due to the large valves and passages for quickly admitting the mix, efficient cooling system, improved whipping device, and the rapid vertical discharge, which enabled the Giants to turn out just as many, and even more batches per hour than the smaller machines.

The owners therefore arranged to trade in the three small machines towards the purchase of still another three U. S. Giants, making six altogether, thus doubling their production capacity without hiring more help, since a man will produce just twice as much ice cream with U. S. Giants as he was able to produce in the past.

Efficiency—No Retrenchment—Offers the Only Hope of Doing a Profitable Business in Times Like These

Hinged Cover Now Standard Equipment on All Sizes

The hinged cover is now standard equipment on all sizes. It adds greatly to the convenience of operation. No danger of injury to its ground surfaces or other parts through rough handling when removed from the cylinder. Heavy lowering and lifting are done away with. Danger from contamination from dirt on account of laying it on the floor is entirely eliminated, and it is always conveniently in place to wash at the same time that the cylinder is being flushed out.

MANY who seek to "cut down" expense, merely cut down production and increase the cost. The right way to cut costs and to increase production is to improve the economy and efficiency of production by installing up-to-date equipment that saves labor, time, power, space, and will also improve the quality and uniformity of your product.

U. S. Heavy Duty Freezers are made in all sizes. Many old manufacturers, and some beginners, are now ordering U. S. Heavy Duty Freezers to keep up with the hot weather rush. They recognize the folly of waiting for prices to come down further. We can still make prompt deliveries. Write us at once.

Our circular on "How to Tell a Good Freezer" is yours on request.

THE UTILIZATION OF THE PFAUDLER GLASS LINED KETTLE IN THE HANDLING OF GELATINES AND FLAVORING EXTRACTS IN THE MANUFACTURE OF ICE CREAM.

The use of gelatines in the making of ice cream to give it "body" has become a standard practice. The proper handling of this gelatine has been a problem to many of the larger plants where considerable quantities of it would be used. Holding it at uniform temperatures, and at the same time guaranteeing that there would be no solidification or caking to the sides of the kettle has been accomplished by the use of the Glass Lined Jacketed Kettle.

This kettle uses hot water as a heating medium and will melt the powdered gelatine in a very short time.

The temperature can be controlled after the gelatine has reached the liquid state, in this way avoiding overheating. The kettle is equipped with removable cover and a horizontal propeller agitator, which is used in the melting of chocolate when the kettle is not holding gelatine. The best results in the mixing of gelatine have been obtained by hand stirring. There is an outlet at the bottom through which the gelatine can be drawn off. A view of this kettle, as used in conjunction with Pfaudler batch mixers, is shown in the accompanying illustration.

For the mixing and holding of flavoring extracts, Pfaudler equipment has been used for a long time. In developing a uniform mixture, the side agitator has been used most extensively, assuring as it does, in the case of blending an even distribution of ingredients.

Especially for the handling of vanilla and fruit extracts, where evaporation and leakage have such a wasting influence,(the one-piece welded tank with tightly fitting cover works out best. As the result of practical experience it has been found, also, that the glass lined container is ideal in this field, eliminating, as it does, all metallic action.

MICHIGAN ALLIED DAIRY ASSOCIATION CONVENTION.

The Michigan Allied Dairy Association, which numbers among its affiliations all branches of the dairy industry in Michigan, will hold its 1922 annual convention and dairy show in the city of Saginaw, in February. The tentative dates are February 14-17 both inclusive, according to an announcement made by Mr. H. D. Wendt, general secretary of the Association, which has headquarters at Lansing.

The Municipal Auditorium, which is almost ideally suited for the purpose in question, has been made available by the Saginaw Board of Commerce. This building has available for exhibit purposes approximately twenty thousand square feet of floor space; a convention hall for meeting purposes seating 600 people and several smaller rooms sutiable for sectional meetings of the Association. The main balcony has a seating capacity of more than a thousand. The total seating capacity of this building, where no space is used for exhibit purposes, is 4,000.

Tentative plans now being developed by the several committees who are co-operating with Mr. Wendt, who will be the show manager, are designed to fully mirror the importance and diversification of the dairy industry in Michigan. The Dairy Department of the State Farm Bureau is actively and enthusiastically co-operating with the State Dairy Association designed to assist in making the Michigan Dairy Show second only to that of the National which this year is to be held in the Twin Cities, October 8-15. The border states of Ohio and Indiana will undoubtedly be prevailed upon to take an interest in the Michigan Dairy Exposition which will be built along the lines of the progress which has been made in the production, manufacturing and marketing of milk and milk products in recent years.

WHY ATTEND THE NATIONAL DAIRY SHOW?

By J. R. Dice, North Dakota.

The dairy farmer is apt to ask why he should attend the National Dairy Show that is to be held at St. Paul next October; he may inquire why he should attend the show after he has attended the State Fair. A hardware merchant may, with profit, attend a Retail Merchants' Convention, but he will usually derive more benefit from a hardware dealers' meeting. The dairy farmer should attend the Dairy Show because it has been planned for his instruction, inspiration and recreation.

Instruction. A study of the cost of producing dairy products during the year past shows that good cows properly fed have returned a better net profit for the feed fed than they did during the inflated price period. Good cows properly cared for are A-1 investments and the National Dairy Show exemplifies dairy type and demonstrates methods for increasing the profit of the herd.

Inspiration.—There is inspiration at the ringside, after a review of the exhibits it is inspiring to realize how immense the dairy industry is and to know of the progress it has made during the last decade.

Recreation.—There are many forms of amusement but let us go to dinner. We find that it happens that a man from Texas and another from Wisconsin are swapping experiences. A little later a down East farmer joins the group and we realize that it really is a national show. After an hour of genial conversation each dairyman is surprised to find that everything considered his community has as many advantages as any and that after all he would rather put up with his lot than chance the troubles of the other fellow—in other words he is a recreated dairyman ready to go back home to his job satisfied that it is worth while.

It has often been noted that men who attend such shows are more successful than those who stay at home. The man who attends this show should be more efficient. The cost of the trip is immaterial if it is profitable. The dairy farmer should attend the National Dairy Show because it is his show.

FRESH MILK AND CREAM
That Won't Sour In The Hottest Weather

SNOW DRIFT SKIM MILK POWDER

NO DELAYED DELIVERIES — NO REFRIGERATING COST

A DEPENDABLE supply of fresh milk and cream that won't sour in the hottest weather—is what Snow Drift Skim Milk Powder insures you. Made from the finest milk, containing all the sweet natural flavor, Snow Drift Skim Milk Powder makes smoother, richer ice cream at less cost. It requires no refrigeration. Be ready to meet the hot weather demand for ice cream by ordering now enough Snow Drift Skim Milk Powder to meet your requirements. Packed in 180 to 225 lb. bbls. Write or wire us for prices on carlots or less.

The Right Products — Priced Right For Better Ice Cream

Golden Key Brand Evaporated Milk

GOLDEN Key Brand Evaporated Milk is right in taste, appearance, and color for blending. Sterilized and of highest quality, Golden Key Brand is evaporated under Federal Standards, insuring no deviation in fats and solids. Packed in No. 10 tins (gallon).

8% Superheated Milk

IN 8% Superheated Milk, there are no grains or lumps. The body is like a thick syrup with low acidity. Fats and solids are not guessed at but checked in an up-to-date laboratory, by trained chemists. Packed for shipment in 10-gallon cans.

Gould's Own Brand Sweet Butter

SIXTY-two pounds of Gould's Own Brand Sweet Butter and thirty-eight pounds of Snowdrift Skim Milk Powder equals 60 gallons of 10% sweet cream. Gould's Own Brand Sweet Butter is perfectly pasteurized. Packed in tubs.

GUARANTEED FRESH

GOULD Products are guaranteed fresh. Made from the best grade materials, Gould products are laboratory tested and conform to all Federal standards. Write or wire for prices. Shipment made immediately.

C. A. GOULD

720 TEMPLE COURT MINNEAPOLIS, MINN.

The New Galloway-West Creamery and Condensary

CONSTRUCTED along lines to provide the highest efficiency in production, and equipped with modern appliances guaranteeing cleanliness, safety and speed. Such is the new plant of the Galloway-West Company, Fond du Lac, Wis. The accompanying photo gives the reader an idea of the exterior view of this most modern plant of its kind in the country.

The front of the building has more the appearance of a public library than a big creamery and condensary. A main stairway divides at the top of a short flight and one branch leads to the main lobby of the building, the other to the private offices. Entering the lobby, an information bureau is found with a telephone operator in charge. Here, also, is a refrigerator where a stock of butter is kept for sale to the farmer patrons of the factory. Passing through this office a small but complete laboratory is reached and then the test room where every requirement of the pure food laws is met with special apparatus for bacteria tests, bacteria cultures, and the very latest equipment for testing milk, cream and other dairy products. From the test room one passes into the receiving room, the heart of the plant, and one of the most interesting places during the rush hour that can be imagined. But visitors can not expect to be there during the rush hour, because they will be in the way.

Galloway-West Plant at Fond du Lac, Wis.

At this new plant the milk cans are received on a conveyor that delivers them at the receiving tank. After the milk is poured into the tank, the can is set upside down on a hydraulic steam washer and dryer, moved to the further end, automatically set upright on another conveyor and delivered to an outside platform. The procession is as regular as the workmen can empty the milk and set the cans down. Twenty-five ten gallon cans are delivered, emptied, cleaned, steamed and dried ready to return to the driver in just four minutes. All waits are eliminated. The milk is delivered at one door. The driver moves to the next door, gets his empty cans and drives off. He unloads, reloads and is gone in less time than it took to unload at the old plant . There is no congestion. While the activity is intense from 10 a. m. until noon there is no delay nor confusion.

From the receiving vats, the milk is fed into four De Laval separators having a combined capacity of 28,000 pounds per hour. From the separators the cream and skim milk flows into separate vats and thence into the pasteurizers. After pasteurization it is cooled down to 40 degrees and is then ready to be put in ten gallon cans, sealed and shipped. The filled cans are delivered to the unloading platform by conveyors and loaded directly into refrigerator cars on track or on trucks for hauling to the depots.

A separate can cleaning department takes care of the returned empties and several men have "some hot" job during the work. The cans are cleaned with boiling water, automatically brushed, and set on a hot air blast to dry.

The company supplies its own power but has connections with the Eastern Wisconsin Electric Company for protection and to carry small loads when its own generators are not working. A Ridgway engine, direct-connected to a 330 K. W. generator furnishes power and light. There is a 34-ton Vilter ice machine, and in another part of the power room a Sullivan air-life engine for the water works system.

A concrete storage tank with a capacity of 135,000 gallons of water supplies this essential. The well can maintain a flow of 1,395 gallons per minute and the centrifugal water pump in the engine room can handle 1,500 gallons per minute. An emergency storage tank of 25,000 gallons capacity is to be erected later to take care of the supply in case of accident to the regular system. Another safety feature is a city connection that can be turned on at a moment's notice.

Next to the power room is the boiler room, where three 250 H. P. Sterling water tube boilers produce the steam to run the plant. Each is equipped with an automatic stoker and a force fan supplies extra draft when needed. The water that passes into the boilers is heated first by exhause steam. Coal when delivered is carried over the storage bin in the railroad car and dropped where it belongs.

Going back up stairs the visitor enters a part of the plant devoted to condensing operations. Here is a large seven foot diameter condensing pan with necessary vacuum pump and other equipment. In an adjoining room are two large glass lined tanks, 9x10 feet, with a capacity of 4,500 gallons each. These glass-lined tanks have a vacuum jacket and brine connection so that milk can be held at any desired temperature. The plant has all equipment for condensing purposes but at the present time this department is not in operation.

The entire Galloway-West plant is 210x85 feet. The general contract was let to the Immel Construction Company, the plans were made by Martin Tullgren & Sons Co., architects, Milwaukee. Much of the equipment was purchased from the Creamery Package Manufacturing Co., of Chicago.

Wescoco a Delectable Drink.

Besides manufacturing regular dairy products, the Galloway-West Co. are also manufacturing a product known as "Wescoco". This product does not consain cocoanut oil or any other foreign fat, but is a new milk

product made of cocoa, milk, sugar and flavored with vanilla, mixed together in perfect proportions, sterilized under pressure, which brings out the fine flavor and aroma; sealed tight in lacquered cans.

Wescoco dissolves perfectly in cold or hot water. It is always the same standard and therefore assures the consumer of a delicious cup of hot or cold chocolate at any time and with practically no labor.

Wescoco can also be used for many other dishes in the kitchen, as well as at the soda fountain. With the proper advertising Wescoco should find a good demand as well as help to increase the consumption of milk.

⚜

STARTLING FACTS.

Some very significant facts for the dairy industry have been presented by Mr. S. H. Greene, Secretary-Manager of the California Dairy Council.

A survey was made of 55,000 children in Los Angeles, Calif., by Dr. Everett C. Beach, and the startling fact was revealed that children who are users of milk complete the eight grades of school work two years earlier than non-users of milk. The survey also showed that the milk users were superior in athletic contests to the non-milk-users.

This survey is of inestimable value and can be studied from many angles.

Looking at it from the financial viewpoint, and recognizing that there are approximately 100,000 children in the elementary schools of Los Angeles alone, and that 20 per cent of these are retained two years longer in their school work than necessary. Mr. Greene figures that the total loss to the city each year runs into the millions of dollars.

It costs about $75 of the public money to keep a child in elementary school each year, or $150 for two years. Twenty thousand retarded children, therefore, cost the taxpayers of Los Angeles $3,000,000.

If the city were to buy a pint of milk for every one of these retarded children for the entire eight years of the elementary course, and if the children made normal progress as a result there would be a considerable sum left out of the present cost of keeping them in school two years longer than the normal children.

There is another angle: 20,000 children occupy 20,000 seats in the school buildings for a little over two years longer than necessary. This means additional expense.

Furthermore, the two extra years which the 20,000 retarded children now spend in grade school could be spent to a decided advantage, financially and otherwise, in high school or in commercial activities, at home, on the farm, or in the city **producing.**

All of this, says Mr. Greene, is aside from, and in addition to, the detrimental effect of these retarded children upon their classmates.

All told, the loss is appalling.

As a result of these findings, the California Dairy Council, with the able assistance of Dr. Everett C. Beach, is now working under the slogan, "Free Milk is as Necessary in the Schools as Free Text Books." They are also working on getting a scale in every school so that the children can be weighed and measured carefully; and also they are following the slogan of all Dairy Councils, namely, "The Milk Way is the Health Way," and "Every Child Should Have at least a Quart of Milk Every Day."

The dairy industry should recognize the opportunities afforded by such investigations as these. It is

It's In the Flavor

"The best flavor is none too good"

In the manufacture of our Vanilla and minor flavors, we keep this fact constantly in mind . . . .

when you use several or any one of our products, you are placing confidence in us, a belief that "B-F Flavors" will enable you to make and sell good ice cream. That we have not betrayed this confidence is evidenced by the substantial business we enjoy from ice cream manufacturers who seek dependable flavors which are reasonably priced.

very important that this information be spread throughout the country, and it is only through co-operation and through effective publicity on the part of everybody engaged in this great industry that these facts can be made known.

Every man engaged in this dairy industry should see to it that he is spending some of his money in **marketing** his dairy products rather than spending his entire amount of money in **producing**. Every person engaged in this industry should recognize that it is to his advantage to assist in conducting publicity of this nature such as will cause the public to recognize the true value of milk and its products. Then this important industry will begin to assume the place it deserves. Dairying is a big business, and a most fundamental one to human life and human progress.

It is only by getting behind the Dairy Council work that this educational propaganda can be conducted most effectively—in the shortest time and at the least possible expense.

Resolve to-day to set aside a portion of your budget for co-operative publicity. You know what splendid results have been secured by the rice growers and dealers, the paint people, the raisin growers, and others. The dairy industry can be equally successful, if not more so, because of the superior value of our product.

Let's get together and tell the best story on earth to the millions of people who are seeking for facts such as we have to tell

HOOSIERS GOING TO THE NATIONAL DAIRY SHOW.

The Fifteenth Annual National Dairy Show, to be held at the Minnesota State Fair Ground (St. Paul) October 8th to 15th, under the auspices of the National Dairy Association, promises to be a grand success.

Indiana will be well represented. With the idea of consolidating all Indiana members in a body from Chicago to St. Paul-Minneapolis, we have arranged with the Chicago, Milwaukee & St. Paul Railway for special sleeping cars on the "Pioneer Limited" leaving Chicago 6:30 p. m. (Standard time) Sunday, October 9th from Union Station, Canal and Adams Sts., arriving at St. Paul at 7:20 a. m., Monday.

Reduced rate of one and one-half for the round trip on the certificate plan will be authorized from all points in Indiana, dates of sale and limits to be announced later. Sleeping car rates from Chicago to St. Paul-Minneapolis, including tax, are as follows: Lower, $4.05; upper, $3.24; compartment, $11.34; drawing room, $14.58.

The famous "Pioneer Limited" Table d'hote evening dinner in courses will be served at $1.50 per plate. No extra charge for additional portions.

Please make your reservations through this office as early as possible in order that we may know just how many to provide for from Chicago in our special cars.

Yours truly,
A. P. HOLLY, General Sec'y,
Indiana Manufacturers of Dairy Products.

Carbonation, Stabilizer and Flavor Intensifier

By PROF. W. PAUL HEATH, of American Conservation Sales Company

The fact that carbonation is beneficial to ice cream in flavor and stability does not mean that it will replace either flavor or stabilizer. It is a valuable aid to both. The carbonation of beverages has always enhanced the flavor—thus one ounce of Coco-Cola syrup mixed with six ounces of carbonated water has always more flavor than an ounce mixed with six ounces of plain water. Replacing the air in ice cream with carbonic atmosphere not only brings out the delicate aroma of the ice cream but the flavor is a livelier, cleaner one.

W. PAUL HEATH

Why carbonation adds to the stability of ice cream is not so well understood. The carbonic gas in which "Heathmade" ice cream is frozen dissolves in the cold semi-frozen mix as it comes from the freezer. This viscous mass of ice cream consists of millions of tiny bubbles of carbonic gas beaten into the mass, each bubble surrounded with the cold viscous mix. This mix has carbonic gas **in solution.** But when the mix is chilled to a solid in the hardening room the dissolved carbonic gas goes out of solution forming microscopic bubbles within the mix wells surrounding the beaten bubbles. These solution bubbles crowd the beaten bubbles bringing about compression through the entire hardening mass of ice cream. Each bubble in "Heathmade" ice cream is full of compressed atmosphere. The resulting ice cream resists a tendency to fall for the same reason that a hard automobile tire full of compressed atmosphere supports a greater load than one of equal size but full of uncompressed atmosphere. Because carbonation results in compressed ice cream it stands up better.

Air in ice cream has served its crude purpose in the past to fill the bubbles in ice cream in order to make it eatable. Without bubbles ice cream would be a solid frozen block of sweetened cream ice.

Bubbles of atmosphere in ice cream serve another useful purpose. They constitute the vehicle to carry aroma. Unfrozen mix carries flavor but very little aroma. The ice cream bubbles give up their fragrant aroma when the ice cream melts in the mouth. By compressing the imprisoned bubble atmosphere in ice cream through carbonation there is more aroma. Air is a light vehicle only two-thirds as heavy as carbonic atmosphere before the latter is compressed.

From the foregoing it will be seen that:

1. Carbonation of ice cream intensifies the flavor functioning the same as it does in beverages.

2. Carbonation by compressing a heavier atmosphere within ice cream bubbles adds to the stability of ice cream and to its banquet attractiveness.

These effects when desireable in ice cream are minor benefits. Greater purity and sanitation in ice cream manufacture constitute the greatest reasons for carbonation.

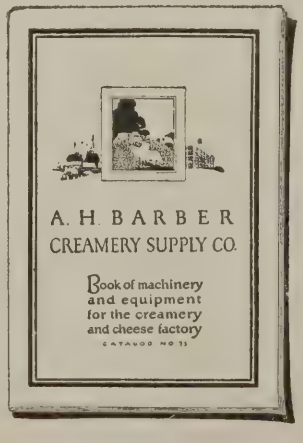
A pure food product is one in which **all** the elements are pure. Air, the biggest ingredient in ice cream, has never been clean and pure. Carbonic atmosphere in which "Heathmade" ice cream is made is clean and pure, resulting in a cleaner, purer finished product. The lesser real benefits of this new sanitary method of making ice cream have been discussed in more detail in order to conform to the plan of this issue of The Ice Cream Review.

⚜

CONSTITUTION DAY, SEPTEMBER 17.

The signing of the Constitution of the United States on September 17th, 1787, marked a very important event in the history of the world. Each community and each individual daily enjoys advantages which would not be his but for the wisdom of the pioneers who gave a Constitution to a united country, North and South, East and West—all are glad that we are one country under one flag.

New times bring new responsibilities and new duties. We would be untrue to those who have gone before if we stood for the Constitution as originally drafted with no changes to keep pace with the world's advance.



Community Service is among the large national organizations who are emphasizing the desirability of each locality having a special celebration to commemorate "constitution day," on September 17, 1921.

NOW SOLAR-STURGES MFG. CO.

Announcement has been made of the change in the corporate name of a well known concern. A card was received in the Journal office from the Solar-Sturges Mfg. Co., which proved to be a merger of the Sturges & Burn Mfg. Co., of Chicago, and the Solar Metal Products Co., inc., of Columbus, Ohio. The main offices of the new organization are at Congress and Green Sts., Chicago, but divisions of each of the former companies will be maintained in the respective cities where they have been operating.

A NEW BARBER BOOK.

A new catalog—No. 73—for creamery and cheese factories has just been completed by the A. H. Barber Creamery Supply Company. It is devoted exclusively to machinery and equipment and is unusually complete, not only listing machinery but showing various tables and diagrams that will be helpful in selecting and installing equipment.

A Real Sales and Merchandising Plan with Carbonated Ice Cream

Something New to Tell the People About Ice Cream

Ice Cream manufacturers who are licensed to manufacture under the Heathmade Carbonated patents get something else besides the rights to make the best and purest ice cream.

They get a concrete sales and merchandising plan, worked out to the most minute details, showing how to create new and larger markets for ice cream.

Write to us and let us lay this plan before you. You will be amazed how completely it meets your every requirement for increasing sales.

Why Carbonated Ice Cream

Heathmade Carbonated Ice Cream is purest because it removes the last possible vestige of doubt about the purity of the product caused by freezing ice cream in common air.

Heathmade ice cream is frozen in an atmosphere of sterile, germ-free, 100% pure Carbon dioxide. It removes the danger of infection from contact of your pure ingredients with impure, germ-laden air.

It safeguards YOU, as much as it protects users of your ice cream.

Makes Better Ice Cream

Carbonated ice cream made by the Heath method, is not only infinitely purer but it is a better ice cream. It tastes better because the carbonic gas intensifies the flavors and brings out the creamy richness of your good ingredients; just as carbonated water increases the palatability of your ice cream soda.

It stands up better because the heating point of carbonic gas is higher than that of air so that carbonated ice cream will last longer, at higher temperatures, than the ordinary ice cream.

Write for Our Big Plan

Write us TODAY for our big sales and merchandising plan. You want to make more money. You want profits to increase in your plant. We will show you how to do it. One of the greatest advertising and merchandising concerns in the country has prepared this plan for us. It is working like magic everywhere. Dealers tell us it makes selling one hundred times easier. It is increasing ice cream consumption. It is planned to create an all year round ice cream business, instead of just a Summer business. We will gladly lay our complete plan before you on request.

The Special Flavor as a Sales Promoter

By Keystone Fruit Products Company

THE manufacture of ice cream has made such rapid strides, and has become so universal in its scope, influence and distribution that its various branches require close observation. Ice cream may be divided into two general classes, plain and fancy. Plain ice cream is a frozen product made from cream and sugar, usually containing a filler and with or without a natural flavoring.

Fancy ice cream often contains eggs, fruit flavors, nuts and colors and is often molded into fancy shapes and figures. A great deal of ingenuity may be displayed and is used in the composition of fancy ice creams and the remarkable growth of its popularity may be traced to this variety which appeals to the eye as well as to the palate.

Years ago, when ice cream was introduced to the general public—for the manufacture of ice cream is not so old— but one or two flavors were used. Vanilla was the most popular and with the exceptions of frozen creams for banquets or parties ice cream to the great mass of people was a rare delicacy. To-day, the great American palate is delighted by millions and millions of ice cream cones or by ice cream served in many ways.

With such an enormous distribution and such universal use, it was inevitable that various combinations of flavors, kinds and styles of ice cream should come into vogue. The men who manufacture ice creams have recognized the advantage of employing ingenuity to produce creams to appeal in various ways. The street urchin may be pleased with a mass of shaved ice flavored with vanilla, strawberry or pineapple. The child may be delighted with a cone containing a dab of flavored ice cream. But the majority of people who patronize the ice cream parlor demand novelty—and here is where the special flavor has been most successful.

Undoubtedly the standard flavors—vanilla, strawberry and chocolate have the widest distribution—just as there are general classifications in pastries or breads. But the ice cream manufacturer with an eye to the future realizes that no one is ever satisfied to stick to the good old "standbys." The concern which produces the greatest number of varieties in flavors may be choking up its volume and overcrowding its capacity as well as increasing the amount of stock which must be carried for sale daily and also held over. But the logical thing to do is to feature one or even as high as three special flavors which are of assured popularity. The cycle of a special flavor usually runs for two or three years at the most. The greatest number of these novelties, however, run for a year—and then something new must be brought out for the public.

This year orange flavor is in the public mind—or shall we say, on its palate. A host of combinations of orange flavors has sprung up on every hand. Out of the entire number, there are perhaps a half dozen which deserve nation-wide popularity. The most appealing flavor this season has been orange pineapple. What will be in 1922 cannot be forecast at this time.

The advantage of the special flavor is that it brings in a lot of new trade which would not be gained otherwise. The public is athirst for novelties. It tires of the "I'll take vanilla, I guess." Your average American wants something different and the ice cream maker who supplies that "something different" so that it will hold a sure appeal is the one who is bound to make the profit. On account of the greatly improved processes of production and the new methods on the manufacture of ice creams, the use of a special flavor is no longer prohibitive in price but runs along with the general economics in daily use. On the other hand, you can get more for a special flavored cream than for the old standards. The novelty is worth a little more money to the retailer and he will not hesitate to pay the manufacturer more. The ultimate consumer will pay the extra price without a murmur because he is getting something new and so there is a better profit all along the line.

Another cause for the very wide appeal of the special flavor which may not have been considered, is that of the increased patronage of the ice cream parlor by men. With the advent of prohibition hundreds of thousands of men turned to soft drinks and ice creams. The palate which had been stimulated for years by hot beverages would not be satisfied by insipid flavors. It needed something with a "kick"—and the special flavor did the trick.

Young America, too, demands special flavors. The ices which used to satisfy our grandparents no longer hold the same thrill for us—and certainly not for our children. These youngsters, ever on the search for novelty want the same "jazz" in their drinks and ice creams as they do in their music and dancing. The "tame" old-fashioned flavors hold no charm. You must serve them ice creams which will tempt their palates with an unusual appeal. This is the mission of the special flavor.

The result of this appeal is increased sales. Every time you bring something new on the market, you are sure to awaken a new avenue of trade. Some man or woman who never cared for ice cream may be touched by that orange flavor—and you have created a new customer. This is typical of every special flavor brought before the public. Of course, a special flavor should not be discarded in a day or a week because it does not "pull like a house afire." It may take a little longer, but the increased business brought by the special flavor is sure to bring added profit and added publicity to the ice cream manufacturer who produces the ice cream and to the man who sells it.

Feature the special flavor. It is the greatest stimulant the ice cream industry has ever known.

MEET us at the National Dairy Show, Minnesota State Fair Grounds (Twin Cities) October 8 to 15, 1921

WE UNDERSTAND

We wrote the Helena Dairy Products Co., East Helena, Montana, relative to their subscription and the farmer president of the concern replied as follows: "The Helena Dairy Products Co. ceased to operate, went out of business, closed its doors, passed into retirement, is ancient history and locally is entirely forgotten." In other words, they quit.

California Ice Cream Manufacturers' Association

Proceedings of the Annual Convention, Held at Oakland, California

(Concluded from July issue)

I might say here that there are two firms in the south who are unintentional exponents of this idea of repetition of impressions. In terms of numbers of impressions made, each firm is benefited by the advertising campaigns of the other, but there is a confusion of impressions which may be detrimental from a purely advertising point of view. The product of one plant is sold under the proprietor's name while that of the other is sold under a coined trade name, nevertheless, the public mind is confused, so that we often hear the two spoken of as applying to the same brand of ice cream. This is no doubt due to the fact that both firms use a good deal of red color in advertising their trade names, and that the names are of about the same length and are similarly spelled.

We have obtained very gratifying results during the past year from the use of painted wall displays. We maintain our own sign painting crew in the field and our sales force secure the locations for us. Often locations can be secured free of charge merely for the protection afforded the surfaces by the painting. Some are secured for the painting or privilege signs, and others are secured through the payment of a regular yearly rental, which in most cases is very nominal. During the past year we have maintained 316 signs in and about Los Angeles at a total cost of a little less than $10,000, including rentals, labor, materials and up-keep of the machine used by the crew. If this same campaign had been placed with the outdoor advertising or bill board companies, it would have cost us at least twice this amount.

Another policy which we have held to very religiously is the development of our own designs for indoor display signs. By using the oil-paint process of stencil work, a very wide range of effects can be produced at a cost about equal to that of the so-called lithograph signs sold by the eastern lithographers, and we can have the decided advantage of giving our own personal touch and ideas to the signs, at the same time getting our trade mark or trade name into the signs in a way so that it predominates, thereby strengthening again the idea of "repetition." Much of the syndicated work is designed and prepared so as to captivate the advertising manager's fancy at first sight, without so much thought being given to their true advertising value. I have found that such signs often prove quite disappointing after the novelty of the first impression has worn off. The picture of a stunning girl is fine in its place; a pretty picture may be pleasing to the eye and have appetite appeal, but it usually will sell the sign rather than sell one's own particular brand of ice cream.

In general I do not approve of large scale newspaper advertising. At present its cost is tremendously high and there are so many large department store spreads appearing that moderate sized displays are almost lost in the shuffle. If newspapers are used at all, they should be used with the same "repetition" idea in mind, cutting out most of the copy which so often looks good and sounds good to our own egotism, but which few will actually read. Use a comparatively small space displaying your brand or trade mark as the main feature; use it consistently month in and month out, and as persons glance over their morning or evening papers your trade mark or trade name will soon become subconsciously imprinted upon their gray matter.

A type of advertising that I do believe has a real place in the ice cream, as well as every other industry is that of the institutional or good-will type, intended to fix in the minds of both dealers and the public the size of the concern, the character of its organization, the service it renders, and the high standard of quality it embodies in its product. Pamphlets, booklets, circular letters, newspapers and trade journals or publications, are, of course, the mediums for circulating this type of impression.

Economic appeals such as "More servings per gallon," "larger profits," or "quicker turn-over" can be used very effectively in so-called dealer advertising, if the manufacturer is mindful of the principle of "Truth in advertising" and sees to it that his product actually conforms to all he claims for it.

I wish to say a word or two here about "destructive" advertising as against "constructive" advertising. A few days ago I listened to an illustrated lecture on milk. For comparative purposes several slides were thrown on the screen, showing a dilapidated and extremely filthy stable in which cows were being milked; a musty dark basement room used for washing bottles and cans; a man testing milk by drinking it from the inverted lids of the cans, and a rare collection of dirty milk bottles. Each of these views were immediately contrasted with the ideal conditions and operations in a model creamery plant. The idea was, of course, to portray vividly the superiority of carefully and properly handled milk, thus hoping to increase the output of the up-to-date plant. However, I am sure that the illustrations of the unsanitary conditions not only clouded the favorable impressions gained from the ideal conditions, but tended to create a marked prejudice against the use of milk. I know that I did not sip my glass of milk that evening for dinner with my usual full measure of appreciation. If something cannot be said about a product that is "constructive" to the industry as a whole, then it is better to say nothing at all. Illusions in advertising to adulterations, substitutions, or the possible use of inferior materials are distinctly "destructive" in effect and are dangerous to use. Even the use of the word "pure" is questionable. I will always remember John Knobbe's discussion of this point at the National Ice Cream Convention in Los Angeles in 1915, when he brought out most forceably the idea that the term "pure" ice cream always implied that some ice cream must be "impure."

After all is said and done, it is mighty hard to trace the direct results or benefits of ice cream advertising. If a department store advertises a sale of a particular article in the newspaper, people flock to the store in response and at once there is a concrete basis for determining results, and such advertising becomes merely a proposition of what is best to say in the various advertisements. With us in the ice cream business, the results of advertising are so intangible that at best our policies must be founded largely on theory and no doubt we all spend considerable money foolishly, in the endeavor to obtain the results that we all know do actually accrue from judicious and properly directed advertising.

The President: Gentlemen, the subject is before you. It's importance demands that it should be discussed. Are there any questions that anyone wishes to ask? Don't be timid. If anyone will start the ball rolling, that is what helps the interest in these meetings.

Service—Not Just Equipment

Elyria Works Economies for Chapin-Sacks

THE Chapin-Sacks Corporation of Washington, D.C., stands among the world's largest producers of high quality milk, Ice Cream and dairy products.

Chapin-Sacks have standardized on Elyria Equipment. In their Main Plant they use nineteen Elyria Glass Enameled Tanks for Storage and Refrigerating purposes. The temperature in the Elyria Tanks never rises over two degrees in 24 hours. Nineteen thousand gallons of Milk, Ice Cream mix, etc., are refrigerated by a 30-ton brine cooler which operates four hours a day. This quantity of milk formerly required 48 tons of refrigeration and the use of hundreds of cans. Milk is handled in one quarter of the time previously required and the cans are ready to be shipped back 20 minutes after they are received.

And—their Elyria Equipment embodies all those other refinements of design and construction which mean economy, efficiency and reliable operation.

Proof

THERE is no part in the manufacture of dairy products where your Elyria Enameled Equipment cannot be used to great advantage from the first step when the milk is weighed.

Your vats take up less floor space, which cheapens the cost of building construction; and you have a big advantage as far as ease of cleaning and making it less expensive to keep in a sanitary condition. The life of the average coil tank is nine years; the life of the glass-enameled tank is almost unlimited. You have less mechanical wear, so that your upkeep cost is practically nothing.

We have adopted as our standard equipment the Elyria Enameled Glass-Lined equipment

G. HALL WHITE

I judge from his countenance that there is something on Mr. MacFarland's mind.

Mr. Vahlberg: He can lead a song, but I am afraid he can't lead a discussion.

Mr. Hage: Mr. President, we had an experience in San Diego like the one mentioned by Mr. Carver. A man went into detail as to the way in which he made his ice cream, giving everything imaginable. One of our drivers came in with a comment, "You don't need to advertise now. Just let that other concern keep on in the way they are going." And he said, "If I doped my cream up that way, I wouldn't tell everybody about it, anyway."

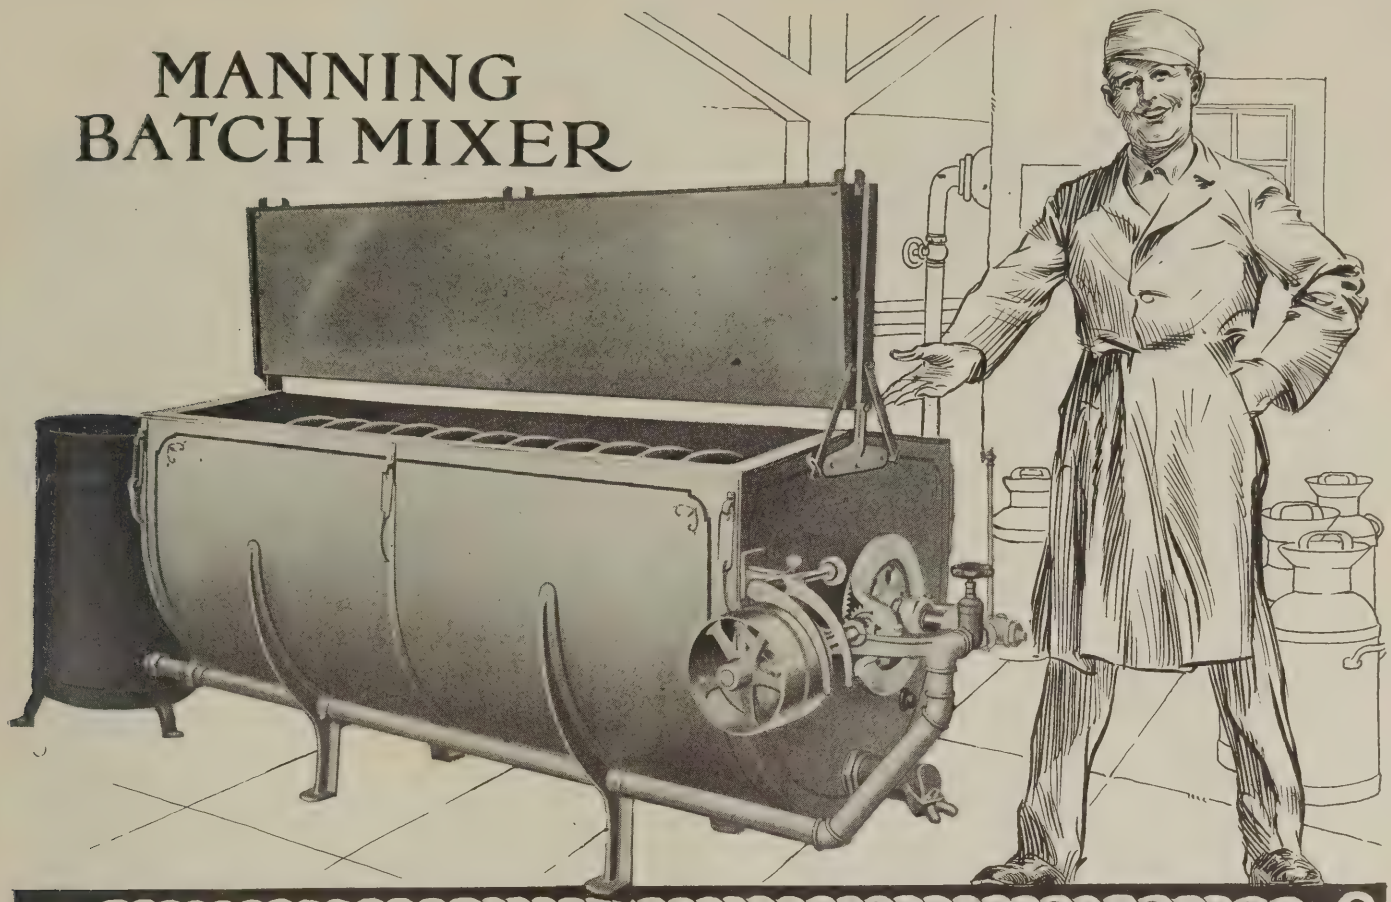
The President: That was a pretty good hunch from a driver. Who is next?

Mr. Hightower: Mr. President, it is my belief that Mr. Carver is right in saying that co-operative advertising will tend to build up an increased consumption of ice cream, and I believe particularly along the line of a winter campaign. It seems we have neglected the winter campaign advertising quite a bit, and I believe if the subject were properly investigated, co-operative advertising along that line in particular would help a great deal.

Mr. K. L. Carver: I think you have missed the point a little bit, Mr. Hightower. The winter campaign, or any other campaign plan of advertising, would be all right if we would advertise a single brand of ice cream, and, furthermore, keep the quality the same. But in every neighborhood there is somebody that makes a very, very rich ice cream, with a large butterfat content, and there may be some little dealer that makes his ice cream in the back of a store and makes a very poor quality of cream, and then there is the rank and file of the manufacturers who make a good, average cream. But the variations of quality tend to form prejudices in the public mind, or differences of opinion, and I don't think any campaign, whether a seasonable campaign or any other type of campaign, will get very far unless they follow the examples of some of these others I have mentioned, who put out a single quality of ice cream and have an inspection, so that we would know the quality of the ice cream was up to the standard and fair, and then all put out our advertising under the same trade name. If you put out half a dozen different brands, there is confusion in the public mind. They will get their various preferences, and hurt the effect of the campaign. To merely advertise ice cream by saying "Eat more ice cream," I don't think any one of us would want to put the amount of money into a campaign that would be necessary to change people's habits and get them to eat more ice cream than they have been in the habit of doing. It would take a tremendous campaign to really change their habits. But if you standardize and advertise a single brand, I think we can get at that.

Mr. Hightower: Mr. Carver, I don't doubt but that you are right along certain lines, but in my opinion it will take a great many years to make all the manufacturers see that point. The point I was trying to bring out was that it was necessary for the manufacturer to immediately commence advertising, to increase consumption during the winter months, and we have here the statistics that the average decrease from the consumption of the summer months to that of the winter months is about 70 per cent, and if we could get the different manufacturers to co-operate along the line of increase in the winter consumption, it would be a step in the right direction.

Mr. K. L. Carver: I question whether you could get an increase sufficient to pay for the outlay, though, and whether you would really profit by it in the long run.



Mr. Hightower: I think that any money that is spent in promoting the sale of ice cream will be well spent, and the harvest will be reaped in the future. There is no question but what we have to make a start on this winter campaign. It is a very serious matter, in my mind, because the average manufacturer makes money in the summer and loses money in the winter, and unless we can make it profitable in the winter, our business is not going to reach the plane it should.

Mr. Platt: If there are advantages of advertising ice cream in its season of greatest consumption, would it not be just as desirable if you keep the one thought in mind of educating the public to the nutritive qualities of ice cream, rather than to put any particular brand of ice cream upon it, or pushing anyone's ice cream—that you devote your energy to holding it up to the public as a nutritious food? It strikes me that that would compromise the views of both Mr. Hightower and Mr. Carver on the advisability of one brand. If you were going to take up Mr. Carver's idealistic ideas along the line of one brand, you had better carry it a little further and have one plant, and have the interest of that plant divided between the different interests in the several plants, thereby eliminating all of the duplication of plants and other competitive difficulties that we encounter now, certain parties selling different qualities or at different prices, or a better quality at a lower price, while their sack lasts? I think if we would have the idea in our minds that ice cream is one of the essential foods, instead of a luxury, it would help out and push it along that line in time.

The President: It occurs to me that perhaps Mr. Platt's opinion there is well taken, and may be was not given as much recognition or attention in the development of the subject we have just listened to, as might be. To understand the illustration Mr. Platt gave, and to extend it just a little further, we know that, during the last year or two, there have been some things discovered regarding the value of milk. Dr. McCollum's work, for instance, and some of the remarkable results that have followed some later experimentation, have shown the public the absolute necessity of milk as a permanent part of our diet. That afforded the milk industry some very effective advertising, but did not quite come under the outlying explanation that the paper contained—not inconsistent with it at all, only there arose an opportunity for doing some effective educational advertising work to bring the public to understand a feature of milk that they did not know before, without any reference to whose milk it was or any particular brand or trademark or locality, and to a certain extent it is possible that the same might be said of ice cream, bringing the public to appreciate the fact that ice cream is a wholesome food and should have a permanent place on the menu in the home.

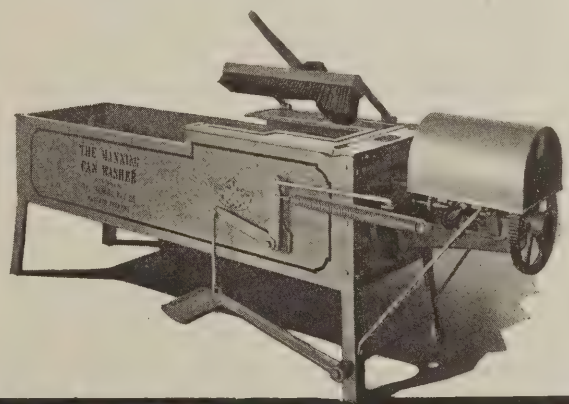
Is there any further discussion of this subject? If not, we will pass to another subject that is somewhat closely related to it. We have with us this morning Mr. Green, of the State Dairy Council. Mr. Green has been doing some notable work throughout the state along just the lines that I mentioned, of assisting in bringing the public to a larger appreciation of the value of milk, the necessity of milk in every home diet, and particularly with children. Mr. Greene has been conducting some meetings and some conferences and some illustrations, in a number of places throughout the state, during the last year, that are showing very gratifying results. And, his being in the city and being here was an opportunity that we, I am sure, will all appreciate very much, since it affords us an opportunity to hear

MANNING BATCH MIXER

Just Half the Time

"That's the reason—in a nut shell—why I chose the Manning Batch Mixer.

"As soon as I saw that double inlet coil—fed by a pipe of the same diameter I saw a sure saving of half the time ordinarily taken for heating and cooling.



"Of course the general Manning construction and convenience were considered too, and my Batch Mixing is done at minimum overhead expense—and there is a saving too of fuel and ice."

Manning methods will save you money.

Mr. Green a few minutes on the subject of the work of the State Dairy Council.

* * *

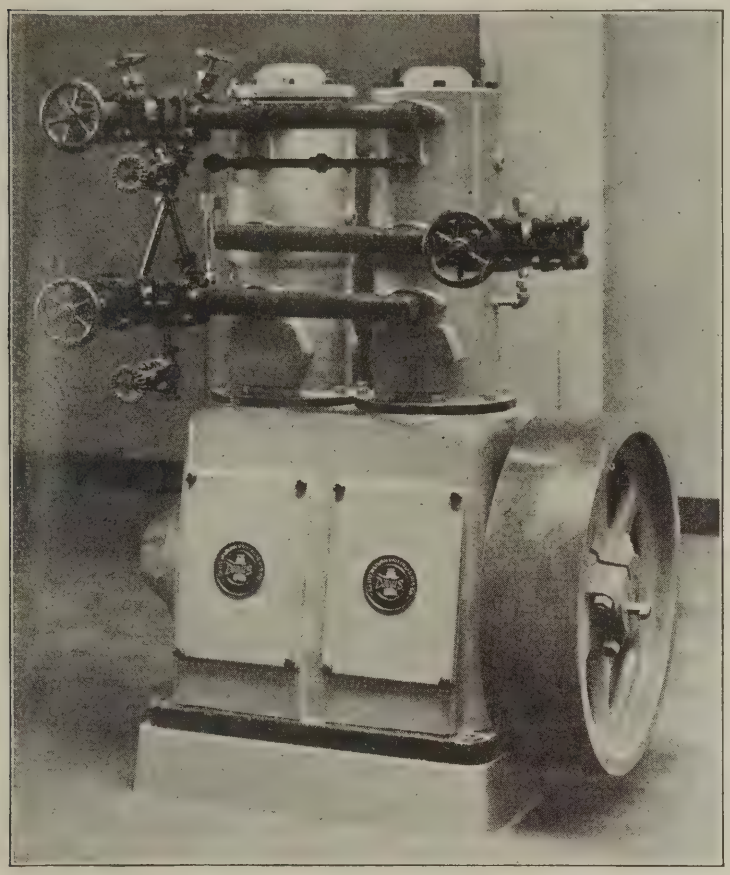
The Work of the State Dairy Council.

Address by Mr. S. M. Green, of the State Dairy Council

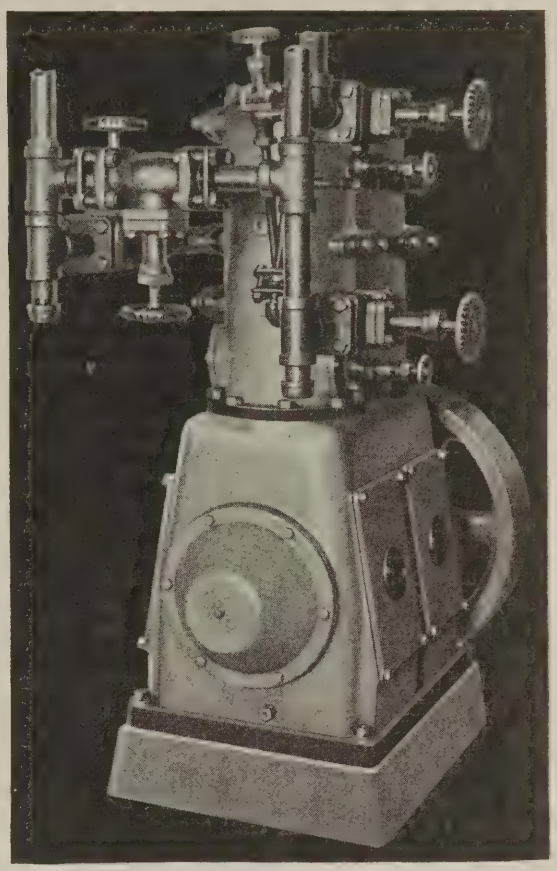
Mr. Green: Mr. President, and members of the Association. The boy stood on the burning deck, when all but him had fled. His pants were twisted round his neck, his shoes were painted red. The lady tore her yellow hair—

Mr. President, I don't think I am getting away with this very well. I think you had better let me go. I have been told sir, that the ice cream industry does not feel that they are part of the dairy industry. I have been told that they consider that they are manufacturing and pushing the sale of a confection, a luxury. And I have become so imbued with the seriousness of this work of acquainting people with the value of all dairy products, that I have lost my sense of humor and can't tell any more funny stories nor repeat poems, and therefore I am afraid I don't fit in here very well. I hope it is not true; I hope it is not so; but I have been told that that is the case.

Now, we of the dairy industry consider that the ice cream manufacturer is a part of the industry. We consider that every man who makes anything out of any part of milk whatsoever, or makes any kind of machinery or implement or truck or placard or anything that has to do with the industry, is a member of that industry, and his fortunes are inevitably and irretrievably wrapped up in the fortunes of the industry.



There is a situation existing in the country today that is one recognized by a few, and it has a most vital effect upon the business of every man or concern that handles any part or portion of any product that is made from milk, and that is the reducing, rapidly reducing, per capita consumption of all dairy products. Now, you probably do not see that, you do not notice it, because most men have their minds concentrated upon their personal affairs, and they do not get out and get the broad vision. I oftentimes think of them as of one of these window-washers that you see on a fifteen-story building, slung out there in a little chair, washing a window, and he is so close to that window that he can't see the next story above him or the one below him, he can't see the height of the building nor the beauty of it or the breadth of it. To do that, he must come down and go across the street and stand on the other corner and look up at it, and then he sees the whole building. So it is with men engaged in individual efforts, they are so close to their jobs that many times they do not see the broad aspect, the results of which have a most vital effect upon their personal affairs.



Now, the rapidly reducing consumption of dairy products is the most serious problem that confronts you. You do not realize it in the ice cream industry, because the sale of ice cream is steadily increasing. Other men, along with you, do not notice it, because they happen to be in communities where the number of inhabitants in increasing. But the facts are that the United States today only drinks 42 gallons of milk per capita every year, while Sweden drinks 70 gallons. We eat only 14 pounds of butter per capita per year, while Canada eats 28; we consume only 3.8 lbs. of cheese a year, while the Swiss eat 26. You do not keep any records of your ice cream business, so I cannot continue the comparison into your product.

But the facts are that you are eating each other up. I think a whole lot of Mr. Carver's paper. Mr. Carver may have some idealistic views, as some gentleman over here said. All right. If you don't have some idealism in business, pretty soon you won't have any business. You have got to have someone who looks further and looks ahead of his time and prepares for the future. And business men largely, not in the ice cream industry alone, but in all industry are like scorpions in a can. You know, you put a bunch of scorpions in an old tomato can, and they will fight and fight and fight until there is only one left alive. And this individual advertising of the merits of your own particular brand of product is that scorpion-like way of getting business. You are not creating a new customer where one did not exist before. You are not inducing a person to use twice as much of the product that you produce as that person used before. You are trying to tell Mrs. Jones that James Smith's product is not as good as yours, and if you are a better advertiser, you will take Mrs. Jones away from Jim Smith, and that is all you have done. And if Jim Smith is a better advertiser than you, he will do the same with your customer.

The California Dairy Council is an organization that has been in existence about two years. It grew out of the experience of some of us who worked in the Food Administration. It was through the Food Administration that we discovered what was going on. We have attempted to build an organization that will care for the entire industry. Not alone are we trying to go to the consumers of the cities of California and tell them to use more and more of all products, as milk, butter, and the other products, but we are going to the dairyman and the farmer and trying to get him to produce more economically that there shall be a plenitude of the raw material, and that you gentlemen shall not have to compete with each other too hard in buying it to use in your produet.

It is a comprehensive plan. It is one that is fundamental. We do not talk about anybody's brand of anything. But we are trying to spread among the people the scientific facts about milk and dairy products that one-half of you gentlemen here do not know, and that are locked up in the treatises and writings of the scientists who discovered them. There are men in this room who are familiar with the work that has been done, and some of them are good enough to say that it is good work, just as Mr. Carver was kind enough to say, in introducing me. And they have backed up those sayings by their good money. They want to see the work spread. So far the ice cream fraternity, as a fraternity, has taken very little interest in the Council's work. When I appeared before you two years ago, the council was just in the process of organization. I asked for your aid and support, and was promised it. I have received it in some instances, but not in many. We began raising the funds for carrying on the work of going to individual dairymen throughout the State and to individuals in the manufacturing and distribution of the product, and interesting them in the work and obtaining their financial support. That has now reached the point where it is impossible to continue in that way. To begin with, the council idea is now fairly well understood from the Mexican line to Del Norte County, and therefore it is not necessary to carry the message in that way. In the second place, it costs too much to make these individual visits. We don't want to spend money in building up a big organization. We are not trying to build up an organization. We want this money to spend in educating the people, and if we have got to pay a man $10 a day to go out and collect $8, it is pretty poor business judgment. Now, that was justifiable in the beginning. The way we are now seeking to protect the work is by going to various associations of manufacturers and distributors, and

Davis Ammonia Compressors

Built for speed, and built to last. Machines of exceptional merit and strength. Made in our North Chicago factory by men long skilled in the manufacture of high-grade equipment used in the best dairy plants everywhere. Excellent materials, carefully machined and assembled. Parts are interchangeable, thoroughly tested, and spare parts and tools are furnished with each machine.

Capacities are from 6 to 48 tons of refrigeration, dependent on the speeds and pressures used.

No clearance. Safety-heads. Force-feed lubrication. Metallic packing. Interchangeable for either right or left-hand operation. Ammonia cannot get down into the base, nor can the oil work over into the condenser and coils. Quiet running, and requires only a minimum of power.

The picture on the left shows the Single Suction Compressor, where only one suction pressure is required.

The one on the right shows the main and auxilliary suction connections. This is of special advantage where two suction pressures are advantageous. The main suction carries the low back pressure, and the auxilliary suction the higher back pressure. The higher the back pressure permissible in any case, the greater the capacity and the lesser the horse-power per ton of refrigeration required. The horse-power per ton is based on the higher back pressure. The suction lines are entirely separate, except the cross-connection with valve between.

This gives *two machines in one.* The pressures are equal on all the bearings, and equally balanced.

asking them to take upon themselves the responsibility of obtaining the money from the dairymen and paying also their own.

Now, we are doing a great deal of this work, considering the very small amount of money that has been at our command. We have trained men who are working in the schools and before men's clubs and before doctors and all others whom they can reach, telling them the story of the value of dairy products in human food. I myself, wherever I can, am doing the same thing.

And the work is constructive. We know that we have promoted the sale of dairy products, one of which is ice cream, even though you have not recognized it before. Ice cream is a dairy product. It is not a luxury; it is not a confection; it is a genuine, real food. And whether you have paid anything in to the California Dairy Council, or whether you have not, we have been talking for you just the same as we have been talking for all other branches of the industry. Every piece of literature that we send out has in it its ice cream section, in which we tell the people of the food value of ice cream. Yesterday I stood before 350 members of the San Francisco Advertising Club in the Palace Hotel in San Francisco, and in a part of my talk to them I said that a plate of ice cream contained more food value than a plate of any other single food or a plate of any compound food of the same volume. (Applause). Thank you—now, if you will all put your right hands into your pockets, and lay the money on the table.

Further yet, this is the twenty-second time I have made that same statement in eleven days.

Mr. Vahlberg: And the first time you have gotten any applause for it.

Mr. Green: Yes. We have had 22 meetings in the last eleven days, at which that statement has been made. And I shall leave it with you as to the value of the work. There are enough here who are interested in ice cream and who are familiar with this work, to give you any information you may require. I appreciate that I have been interpolated on your program here, and I will probably delay matters if I attempt to tell you the whole story. I have brought with me this morning Mrs. Kewing, who is doing the educational work here, but I think we shall retire and leave the matter with you. Definitely, this is what I want. I want you to discuss, after we leave the room, the California Dairy Council and its aims and purposes for a few moments, and if, in the opinion of this Association, this is a laudable work and a work that should be carried on, I then would like to have this Association endorse the work and agree that the ice cream manufacturers will pay to the California Dairy Council, through your secretary or through your treasurer, fifty cents on every thousand gallons of ice cream that you manufacture annually. If you will accept some of the recommendations of Mr. Carver, which are absolutely sound, as I know, having spent a great deal of my time in that way, and cut off some of your advertising appropriations in the lines he has shown to be unprofitable, you will have the fifty cents for the council and another fifty cents for something else. In other words, you will be saving a dollar on a thousand gallons of ice cream, fifty cents of which you can well apply through the Dairy Council. The milk people, as Mr. Carver mentioned, tried an advertising campaign. They spent good money, hundreds of dollars, and up into the thousands. They didn't get anywhere. I was told in one section where they spent quite a little money they could not see that they had sold an additional pint of milk. Ladies and gentlemen, it has got to be first reached through personal contact. Personally we have got to get up before small groups of people and tell them what it is and tell them what it means. We have got to tell them that every growing child should drink a quart of milk a day, and every adult should have a pint of milk a day, and everyone should eat at least a half pound of butter a week and that they should eat a plate of ice cream, at least, every day, and make it a part of their meal, not a confection, and eat it at home more than they eat it in the soft drink parlor. If that is of any assistance to you, it is worth the money. I cannot personally visit your places of business individually and bring this question to you one by one. If I am going to carry on the work, I have no time for that. If I am to hire people to do it, I am, as I have said, building up an organization, which is useless for your purpose. We don't want any more personnel in the Dairy Council than is needed to carry the message to the people and increase the per capita consumption, making two customers where one customer now is, in order that all of your businesses may grow. And if you will see the matter in that way and agree that you will pay, through your Secretary, an assessment of that kind, I personally feel that your money will be returned many times over. But I prefer to leave the final decision in the hands of the association itself.

I thank you. (Applause).

The President: I think we are to be congratulated, gentlemen, upon having had the opportunity to hear Mr. Green upon this subject. It is a very important one, and I should be glad to hear from any of you upon any branch of it or to any suggestion you may have.

Mr. MacFarland: Adding to the remarks of the speaker, I think we have the full right at the present time to commend California for her position, which has brought ice cream all over the country as recognized from a certain standpoint. In regard to the dairy industry, California was the one that first brought out the slogan, "Ice Cream: the rose of the dairy industry." And that has been carried across the country, and that was put forward right here in California for the first time.

Mr. G. Minor Smith: Mr. Chairman, I believe that Mr. Green's work is worthy of the support of all men interested in the ice cream business, as well as in any other line of the dairy industry. My own particular firm supports the California Dairy Council, as a milk dealer, as a butter dealer, and as an ice cream dealer, and we feel that the California Dairy Council is doing a work which no other organization can do as successfully. They are in a position to advertise in the method which Mr. Carver proposed in his paper as the best and most effective method, the method of joint advertising to increase the consumption of the product, without regard to any particular brand or any particular firm's output. And it occurs to me that we can get behind a movement of the California Dairy Council in their efforts to advertise our product, and we can spend our money in that line of advertising to better advantage than we could by individually spending it in trying to advertise our own particular products. As I say, we support the California Dairy Council in three different capacities, and we feel that the money we spend is well spent. The advertising feature of the California Dairy Council has of course not been carried to a very great extent, because they have been limited to a great degree in the matter of funds. They have not had the support of a good many of the industries that are connected with the dairy industry, such as the ice cream manufacturers, but I do feel that they are entitled to the support of the ice cream manufacturers.

I am a new man in the ice cream game, I have only recently joined the Association, but I haven't any hesitancy in raising my voice and stating that I feel that

You Must Please Her

IT'S the ultimate consumer you're aiming at. Once won, she's the mightiest advertising medium you can have. The quality, flavor, texture and velvety smoothness of ice cream depend largely on the purity and fineness of the gelatine you use.

Essex Gelatine for nearly twenty years has played a vitally important part in achieving these results for the ice cream industry.

Mr. Green and his Council are entitled to our support. They have supported and are supporting us now, and we would like to see the Association support them.

The President: It occurs to me that it will be entirely appropriate for the Assoiation here in its meeting to take any action it may see fit upon the suggestion of Mr. Green. Or, if they prefer to leave it to the Board of directors, it would be entirely within the province of the Board of Directors of this Association to take that matter up and act for the Association, and do what it may deem best. I think either course would be entirely appropriate. I think the subject should be given consideration, and action should be taken. It certainly seems to me that it is incumbent upon this Association, either itself or through its Board of Directors, to do something.

Mr. Smith: Mr. Chairman, in order to bring the matter before the convention, I move that the matter of the support of the California Dairy Council by this Association be left to the judgment of the Board of Directors to be acted upon in the very near future.

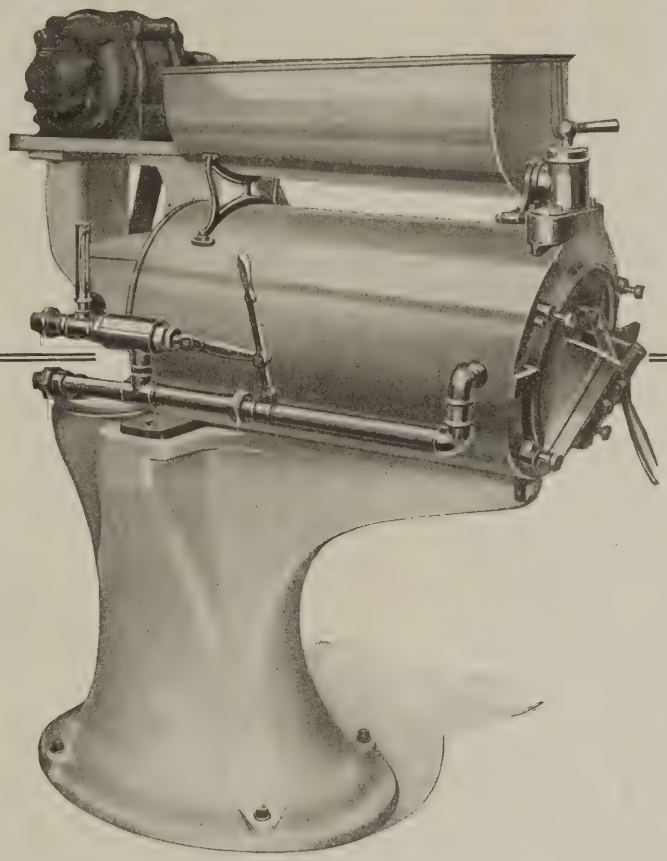
Mr. Vahlberg: I second the motion.

The President: It has been moved and seconded that the matter of the support of the State Dairy Council be left to the Board of Directors of this Association, with authority to act on their judgment as to what would be appropriate. Are you ready for the question?

Mr. Platt: Mr. Chairman, before you put the motion, I, as one of the parties who have had a good deal to do with the early work of the California Dairy Council, would like to state to the members here that we of the south, Los Angeles and vicinity, think that we already see an increased interest in milk and an increased sale in dairy products, more particularly, possibly, of milk alone, because we have followed it up in our end of the state along that line. But we believe that the ice cream manufacturers will get a great amount of benefit by subscribing their quota, as asked for by the Secretary-Manager of the Council, and I want to repeat that we believe down our way that we are already getting a decided benefit from what has so far been done by the Council.

The President: Is there any further discussion of the motion? If not, all in favor of the motion as made and seconded, make it known by saying aye. Opposed, no. The motion prevails unanimously.

The next subject on our forenoon's program is the topic, "How Should Price Adjustments Be Handled?" by our Secretary, Mr. Beaudry.



(Mr. Beaudry read an excellent paper, a copy of which we have so far been unable to obtain.)

The President: The subject of price readjustment, gentlemen, is one that is inevitably before us. We have all been thinking on the subject, and now is our time to express some of those thoughts.

Mrs. Babcock: I think the readjustment stands just as much with the retailer as it does with the manufacturer. We know to-day that a lot of retailers are dishing twenty to thirty scoops to the quart. We talk to them on the subject and they want to know when ice cream is coming down, and we say, "Well, if we come down, are you willing to come down?" and the answer comes, "Why, no. We are not making any money now. It is the manufacturer that is getting it all." I repeat that I think it stands as much, if not more, with the retailer for the price of ice cream to-day, as it does with us manufacturers. Every retailer in every district has a different price. We have some places in our city where they are getting sixty cents a quart, and perhaps within two blocks they are getting eighty-five cents or seventy-five cents. And yet the retailer is not making any mooney, he says, paying us $1.60 a gallon for his ice cream. It seems to me that the retailer is not taking a right attitude when he does not see fit to come down and give the public the amount of ice cream he should give for the price that he is paying us.

Mr. Beaudry: There is quite a difference of opinion as to how much the retailer should make on ice cream, or anything he sells. You know, the retailer is in an entirely different position from that of the manufacturer. The reason is that the retailer has a very much larger amount of unproductive labor than the wholesaler. In the wholesale business, pretty nearly everybody does the amount of work he is supposed to, and produces something. In a retail business, you really get only about half the labor you pay for. The balance of the time they are waiting for the customer to come in. So they require more profit than the wholesaler, as a matter of course. However, to give you a little instance upon the subject, I was discussing this subject coming up on the train a couple of nights ago, and I said to one party, "You know, in a wholesale candy business, we take our cost and add fifteen per cent to our factory cost. We presume that is our cost at our door, without any selling expense or delivering or office expense." And the average candy manufacturer to-day will tell you that he adds forty per cent to this cost to getting his selling cost to the wholesale consumer. That is fifteen and forty, or fifty-five. No retailer can live unless he makes forty per cent gross. May be a few can do it, but the average man cannot do it. The average made by the retailer is fifty per cent. One of the big stores down town in Los Angeles called me up one day and said, "I want to see you." I went to see him. He said, "I am not making any money on my business." I said to him, "Why?" He said, "I don't make fifty-five per cent gross," and in order to keep that man, I had to give him fifty-five per cent gross on the business. That is one of the biggest stores in the city. It does about $300,000 worth a year, and that man really ought to be able to sell cheaper than the others, because his output is so large. However, to give you an idea, if you sell ice cream at seventy cents in brick, and you want to make forty per cent gross on that, your gallon price would be $2.80, and forty per cent gross on that would be $1.12. This man ought to get his ice cream at $1.68. At the present time I believe it is selling somewhere around sixty-five or seventy cents a quart retail in Los Angeles. So you see these people are not getting any more for their ice cream by the quart. If you want to reduce the price from sixty cents to fifty-five cents, you can easily tell what it would be—at sixty cents, it would be $2.40 a gallon, and you have got to let him have it at $1.46 for brick as against $1.75 now. So you can figure what you are up against when you try to tell the retailer how much he should charge. It is very easy to tell him he is making too much profit, but when you start to figure it down and tell him he is, he can show you where he is not.

Mr. Platt: At this time, may I not, as an old man in the industry, but a young man in the ice cream part of the game, make a suggestion to the members here? There do not any of you seem to have anything to say. Here is one of the most important topics that can possibly be brought before you. Why don't you all get in and discuss it? We have found in our live milk organization down there that everybody talks, and I believe everybody should take hold here and not let a few do it all. I believe this question should be thoroughly talked over. You should wake up. It is im-

Reduction in Emery Thompson Freezer Prices to Pre-War Values

Substantial price reductions on Emery Thompson Brine Freezers effective July 1st. Compare the big Horizontal freezer with the "1914" quotations and other type Emery Thompson Freezers so close to pre-war figures, that in view of the improvements, and heavier materials, they are comparatively at pre-war levels.

As our present output is right up to the peak of last year's sales this reduction is being made and based on keeping up and further advancing the sale of Emery Thompson Freezers, for greater sales develop higher and finer production, and more efficient and lower manufacturing cost.

portant to you. It is your profits, maybe, for the next year. Because the other fellow thinks you, keeping quiet, are going to lower the price. The price has got to come down a little bit. We all have to recognize that—lowering the butterfats, lowering the sugar part of it, and lowering, possibly, of the labor part of it, by an increased supply. We ought all to look at the consumer side, and we also ought to have a discussion as to the possible means of making the retailer do what he ought to by way of a public advertising campaign, not carried on for any one individual, but carried on by your individual association, or, if necessary, by the Satte Association, establishing a uniform price or a price for different sections, and making the retailer do what he ought to do for the good of the industry—sell more ice cream. Now, ladies and gentlemen, I believe this is the time that you should get in and all talk.

The President: Mr. Platt is right. As I said a moment ago, there isn't one of you sitting here that has not been studying this question and who has not got pretty definite ideas in his mind of what he thinks he should do. The man who sits beside you, or your competitor, is doing the same thing—his head is full of things that have resulted from several months of studying this question as to what he probably will do. We are gathered together here. Just put your cards on the table and discuss these things, so we can all get the benefit of each other's view. Then, when you are ready to put something into operation, you are immensely more likely to carry it out harmoniously and without trouble. That is what we are here for, to compare views and each get the benefit of the other man's experience and views. You have the ideas in your heads, there is not question about it, and, as Mr. Platt says, why not talk about it? This is the place to talk about it, not wait until you get home and then slip around the corner and try to put something over on your competitor, because he is just as shrewd as you are and probably just as wide awake, and probably thinking of this thing as long as you have been.

Mr. Hage: Mr. President, here are some points about the price of ice cream. I think we should go pretty slow in declining the price. I have heard it said that ice cream should go down twenty cents, because butterfat has dropped that much. Do you realize that butterfat has got to drop thirty cents a pound to make ten cents a gallon difference in the price of ice cream? What other things have you got that go into it? As I see it, sugar is off now about as low as it will go. There are so many things that come up under the head of power that enter into the manufacture of the product that I don't think we will be able to manufacture ice cream as cheaply as we did in 1915 again for a long time, at any rate. The power proposition comes back to the oil, and oil is bringing $2 or $2.25 a barrel in place of seventy-five cents as it did then, and as I see it, oil for power regulates the price of ice, it does not matter who is making it or where; it regulates the price of condensed milk—when it comes to condensing milk, the power is a big factor, and it takes an immense amount of steam to make condensed milk, and they don't look for any big decline in condensed milk. Gasoline is used on the trucks, and we used to buy it for fifteen cents a gallon, and there is a fifty per cent increase, and it is not getting any lower. Wages of trained help, it is very questionable whether we will be able to lower them to speak of. We will be glad to get the labor, I am thinking. And there are repairs of all kinds, metals of all kinds, cones, and things like that—they will be a long while going down.

So my idea is that we should hold the quality and go very slow with reference to any big decline of ice cream prices, for the first thing we know, the books are going to show a red balance, if we do not, and a pretty heavy one, at that.

The President: Who else has something to say on the subject?

Mr. Hightower: There is no question, Mr. President, but what Mr. Hage is right in a great many respects. But in the face of all other commodities decreasing, it seems to me as if, in some parts of the country, the ice cream price has got to decrease, but in some particular parts of the country it hasn't a chance to decrease, for instance, in the part of the country where I live we cannot decrease it, because we didn't raise it. But in other communities, where they raised the price with the propaganda that they were doing so because the price of other commodities was going up, now when those commodities are going down, it looks as if they would have to reduce the price to some extent in order to keep the public satisfied. For if we don't keep the public satisfied to a certain extent, it is going to hold down the consumption of our product.

I have worked out a few little features in our own territory, where we haven't a chance to decrease the price, because we are only getting $1.10 and $1.20 for the product now. But, in a case of that kind, the manufacturer can make money, I believe, by co-operating with his competitors along the lines of fair dealing, etc., and I think that is the best solution, particularly to some of the traders throughout the state. In other particulars, I am sure that unless there is a small decrease, at least, it is going to create some public sentiment that won't do any of us any good, in the face of all other commodities being on the decline.

Mr. Hage: I did not mean that we should not have to decrease, but the point I wanted to make was that we did not want to jump at conclusions on a big decrease, because you will never get it back again.

The President: The point that ought not to be overlooked in my study of this question is that whatever is done, it should be done in such a way as to make sure that it is passed on by the dealer to the public, and not done in such a way as will permit the dealers to absorb the difference in price that you make to them. That must not be overlooked. It may be a difficult thing to handle sometimes, but, nevertheless, it should be handled, and the plan of movement in the matter of adjustment should be studied out and guarded so as to make sure that whatever is done is done clear down the line, and not absorbed at any point along down the line.

Mr. Hightower: In some parts of the country, the manufacturer has recognized that very fact, and they have gotten together and have been big enough to advertise the product and the price of their product in the newspapers. We find throughout the country, not only in California, but all over, where one dealer on one corner is selling our ice cream for fifty cents, and on the next corner there is a man selling it for sixty cents. I believe if the manufacturers would get together and have nerve enough to advertise the retail selling price in the newspapers, the retailer then could not have the nerve to make the consumr pay more than that advertised price. That would be one way to keep the retailer from taking advantage of the entire reduction.

Mr. Beaudry: I don't want to take the floor all the time, but we have been urged here to get up and say something and tell some of our experiences, and if we don't do that, we don't gain anything. Let me give you a little experience we had in Los Angeles, and I really believe that the ice cream business should be protected.

"UCOPCO comes packed in red drums"

The idea of Mr. Hage, I think, is way off on that when he says that when prices come down you won't be able to bring them up, or at least that was an inference from what he said. That is not so, I think. Everything goes up and down, and we pay the fluctuating price. There is only way to conduct the ice cream business, and it is when things are down to have the price down, and I don't mean to reduce the price because somebody is asking for it or because the public thinks it should be reduced, but if, when you figure your cost, you then find you can reduce twenty-five cents, reduce it, and if you can reduce only five cents, reduce to that extent. And then when the price of things goes up, raise the price. I have seen the ice cream business and I have been in it fourteen years—we never raised when the price was up, the price was 75 cents, and if some ingredient went up, the price was 75 cents a gallon still, and so if it went down to 35 cents, the price was 75 cents a gallon still—there was no change. The only thing was that just as soon as we tried to figure a raise in price, there was a perfect riot, and every time that butter and milk went up, the business was supposed to absorb it, without change of price. But that isn't logical and it isn't proper. Take the candy business. There is a new list every three or four weeks, and the public pays it. When the price of butter goes up, what do you do? You pay the increased price. When the price of eggs goes up, you do the same thing, and when the price of bacon goes up, you pay the added price. Why shouldn't the ice cream price follow the market? There is no reason why we should have a price of ice cream for a year or six months, unchanged. If the manufacturer's cost price is such that he can afford to lower it, it should be done and done now, and two months from now, if sugar goes up to twenty cents a pound,we can raise it again, and should raise it—and there should be no objection to it. That is what everybody else is doing in business, and I am sure no one can suggest a logical reason why we should not do the same.

Mr. Platt: Mr. Chairman, I want to emphasize the remarks that Mr. Beaudry has just made, and I don't doubt but there are some of you could tell instances where it may have been your way. We are talking a good deal over here, we people from the southern part of the state—we believe in talking down our way, you know. Our organizations get in and talk. You know I remarked that to you before. Prior to the milkmen getting together, way before the Sherman Act was passed, we had a little organization down there, and up to that time the price of milk never varied to amount to anything. The aggressiveness of different dairies and creameries in getting after business varied according to supply and demand. Five 3-gal. cans of milk sometimes broke the market 10c. But after we had gotten together there, we formulated a plan and tried it once of raising the price. When we raised the price, we each agreed to keep off from the other fellow's customers. We could not take him and would not take him. That was before the Sherman law was in effect. We found that we could raise the price of milk. We didn't take the other fellow's customer—we just simply stabilized the market. And we found in doing that that we could raise the price and lower the price, if we did it and made a practice of doing it, so the market expected the price to change. The first time it was very, very hard. We had a lot of weak-kneed people, and people with weak spines, too—they absolutely didn't have any backbones in them at all, and they would not stand up, and so a good many of the more staunch suffered from it. But eventually we got the public to expect that we would control the price, and that iswhat you want. It didn't make any difference whether it was the retail price or the wholesale price, we wanted the public to understand that the price is

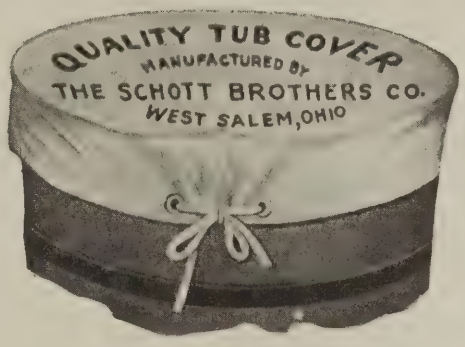
governed by something, and generally you want to have that something on a fair basis. If that price governing is based on a proper profit being taken from the business, you are all right. If you are thinking that you can put it over on the public and get by, you are an injury to the industry, and you should get that idea out of your system. The price should go up and should go down according to the actual cost of its manufacture. We believed at this time that we might help the industry, and we thought also the price of ice cream in our section a reasonable amount. Now, we are sure that the public will feel we are taking care of them, extracting only what we have a right to, a reasonable profit on our business.

Mr. Goode: Mr. President: In line with the meetings that we had last year, in considering prices, I think it will be well to discuss this question. We decided that certain districts in the state, it would be possible to manufacture and sell ice cream at less price than in others. For instance, it might be possible to sell ice cream at a less price in Los Angeles than at San Francisco, and possibly to sell ice cream in the San Joaquin Valley at a less price than in either of the other two places. I would just like to pause here to say that if there is any question of reduction of prices, it should be unanimous, that we should have small meetings in those sections, to consider the prices at the same time and with the same interest at heart. That sometimes has not been done, and I feel that that would be a great thing to put before the convention, so that we would understand that and act upon the plan and upon the foundation that we tried to lay last season in that work. I think that at this time that with the lessening of the prices of butterfat and sugar and other commodities, that there might be a feeling among some that they could reduce the price more than what really would be good business at this time to do, considering the high costs of everything else. So I feel we should at this time take that into consideration, seriously.

Mr. Dorman: Mr. Chairman, the southern part of the state seems to have been heard from pretty largely, and we are up here in the midst of the big cities of San Francisco and Oakland, where they do a big business, for big people, and it seems to me we ought to hear from them. There is our good friend, Mr. Ames—we have heard recently that he is an ex-Los Angeles man, and I think we ought to hear from him and how his arrangements work out, and whether he is coming down to let us have the benefit of his experience. I think we ought to hear from him this morning.

Mr. Vahlberg: Perhaps I might speak for the National Ice Cream Co. You see, the trouble is that we do very little business here in the winter season—we have a very cold climate, that you remember. Down south you have a very warm climate, and you do a very large business, while here our business drops down to one-third or one-fourth, and there is our overhead in business, that is the same, and the volume governs your price. In the summer season, in a climate like this, you may be able to get by with a reduction, but during the winter season you are losing. You operate at a loss three or four months every year. In Los Angeles and the south, you can get by all the time and can always make money. That's why you talk so much, because you are feverish about making money. But you don't feel that way when you come north—you come up here to visit, you don't come here to stay—you want us to go down south instead. Of course now is not an opportune time to lower the price. Of course, there is the change in the sugar price, and the San Diego man has told you about the variation in butterfat, what little amount of change in your price would be made if your butterfat dropped twenty cents, and the same thing is true of sugar, it varies the cost but very little, and all the time the overhead is going up. Our expense is much heavier now all the time. We have got to pay more labor, you don't have to pay as much down there as we do here. Everybody has to be paid up north, but in the south they live on climate. You know, if we only had that climate of yours, we would be bigger than you are. We have got more water than you have—we have a lake here bigger than your whole town—look at Lake Merritt, with all these ducks in it. We will give you a look at the ducks living there. But you can't do that in Los Angeles—the ducks will fly right past you. They have learned to like the San Francisco Bay region.



But laying all joking aside, I think your price should be governed by actual cost. When your books don't show profit, you can't lower the price. When you show a profit, as you do in Los Angeles, lower the price. But I think you are giving too much trust to your retailer. Your retailer has always made big profits, when he figures forty and fifty-five per cent, and you figure profits at ten or fifteen per cent, and you have got the same expense all the time while he can cut down and let one or two clerks go if he chooses. That you can't do in the wholesale business. In the wholesale business, you have got to carry the same overhead right along, and your retailer comes along, and of course he pays a little more rent than some of us do, but he gets by. But he is always figuring on a large profit. Every retailer, if you raise him ten cents, raises the price twenty per cent and gets it. But I think if you establish a retail price, as Mr. Hightower suggests, for your product, for your ice cream, for your cones, and have the nerve to do that, I believe you will get by and that you will then observe that while the retailer will sell more, you will make more. The only thing the retailer wants is volume. If he makes but two or three sales, he can't make anything. If he doubles and quadruples that, he makes more money. That helps the manufacturer and everybody. Then, why do they stop buying ice cream, from what point of view? Because there is a raise in the price. Why stop buying cones when the price you pay is six, seven, and eight and ten cents per cones? That is too high. Put the price down to five cents, and they will buy them. The thing we all work on and the thing we all need is volume. Don't worry so much on getting the price all the time—worry on the volume, and let's all work together. Co-operation is the secret of the whole thing. Let there be co-operation between your retailer and your wholesaler, and the public will co-operate with you, if you establish the price right, the retail price especially, and the business will be helped.

Mr. Dorman: That speech is very good applying to us from the south. We have wondered many times why we have fifteen to twenty overland trains coming into our city each day, with five or six sections to each train, and we can understand now the attitude of San Francisco—and Oakland, too—they seem to understand our problems so well down there, and if they understand them so well and know of our attractiveness and reasons why we should satisfy. I can understand how the eastern people are of the same opinion.

Mr. Vahlberg: That is just the way you mooched. You always did that. You lay off for a while and then you work.

Mr. F. E. Miller: Mr. Chairman, I have been sitting back, like the rest of them, enjoying everything that has been said, because I knew when we first approached this subject that everybody was just full of it, but we were just waiting for the other fellow from San Diego and Los Angeles, and we are glad to have them get up here one by one and speak out, and they do set us a good example by speaking out in meeting, while we seem to be a little shy, considering the fact that we are everyone

of us full of the subject. We are really every one of us here full of the subject of price and where you can slice off, which really comes the closest home of anything that we have before us at this convention—it touches our pocketbook.

I think the point has been pretty fully brought out. It is the fact, as has been stated, that only a few of the items have really gone down. But, as Mr. Hightower says, the reason why the price was raised was because butterfat and sugar were so high, and when the prices of those commodities go down, people naturally say, "The price ought now to be lower." But it all comes back to taking your dealer into your confidence, and letting him understand that, fuel oil being so much much higher, and wages, and almost everything else so much higher, that we can really only reduce proportionately to the reduction that there has been in the items of sugar and butterfat. The public do expect a reduction, and we must make that reduction to the extent that they are entitled to it, and no more. I don't personally know how much that would be, but I would estimate it would perhaps be not over fifteen cents, or at the extreme not over twenty cents a gallon from the high point of the year. But as Mr. Vahlberg says, every ice cream manufacturer at this season of the year is running behind—we are giving something for nothing each day. I figured last year the cost for every month, and every gallon that we put out in the month of January cost us $1.50, and our average selling price was lower than that at that time, and so I just took our list and I went on until the most favorable month in 1920 when our average cost price, including material, factory, and everything, was $1.04. And in that month our average selling price was $1.42½. And we made up the difference that we lost in the winter season. But it is too bad, when you have three or four months with so much less, and then you have to make up in the summer-time—it is really hard to figure at just how to get the right price. Personally, I believe, as Mr. Platt says, that the public are used to buying other articles at varying prices, and to have the price change, and there is no reason why the public should not pay a varying price in ice cream. And in this connection, some of us lost in volume of sales, because the price of ice cream to the ultimate consumer, that is, the public, was too high. And certainly, if we are united here, and organized, we can in very large measure fix this retail price of ice cream, and in our own community I believe it ought not to be,in brick or bulk, over sixty cents, and we ought to insist upon it and perhaps give publicity to it, and then none of our dealers would dare to charge more. We should not lower our price now more than fifteen, or at the most, twenty cents from the peak of the wartime prices last year.

The President: Is there any part of the state now that has not been heard from? We would be glad to hear from it. I think we have had no word from Sacramento.

Mr. Hosking: I think the Sacramento people take the same view as do Mr. Miller and Mr. Vahlberg. There is a different condition existing than there is in Los Angeles, and I think Sacramento has it even more pronouncedly than Oakland. We have a short season up there, and we have an awfully long winter season for our business, and we do feel up there that the retail stores are charging too much for our product. Three years ago they were getting fifty cents, and they have been now getting seventy-five cents. As was stated by one of the gentlemen here a little while ago, I think if we could get together in our town, set our prices, and advertise through some medium, possibly the Chamber of Commerce would be the best one, we would get a proper result.

The President: I think perhaps from the remarks of two or three of the speakers that a wrong impression prevails, that is, I take it they were not entirely in jest in what they said regarding Los Angeles and its winter output. As a matter of fact, there is no essential difference. Compare Los Angeles with San Francisco or Sacramento or even the Eastern states, and it is a little hard for us to understand why there is no difference between Los Angeles and the Eastern states, for instance, in the ratio between the winter and summer business. As a matter of fact, there is very little difference. Our winter output falls to as low a ratio as compared to the summer as does yours, and about as low as do theirs of the Eastern states. I used to think that was impossible, until I looked into it.

Mr. Wilson: Mr. Chairman, you talk about our grocery stores, and our small confectioners, selling brick ice cream. I would like to ask if there is anyone here can inform us as to what margin of profit they expect on a quart brick of ice cream, what percentage of profit to the retailer? What will be fair to make, what percentage?

Mr. K. L. Carver: I can't say what the dealer might expect. They expect all they can get usually. It works out this way: A man can sell brick ice cream and sell it at the same price he sells bulk ice cream for, and still make an equal or slightly better profit, and I have seen that worked out a number of times where persons would go ahead and sell bulk ice cream and dish it as carefully as they could and come out at the end of the week and find they had made very little profit when they stopped to consider their trouble and carton and shrinkage. Switching over to the bricks would tend to build up their business, and show them a better profit. I don't think that is often appreciated, the matter of profit.

Mr. MacFarland: In Chicago, one of the largest stores put out a very, very large gallonage of brick ice cream, and every carton has the retail price on it. So the price is established in the public mind, and they know just what they have to pay for it.

Mrs. Babcock: In the New England states, they are trying out this system of advertising what brick ice cream ought to be sold for. They are going to run ads in the newspapers, telling the people what brick ice cream should be sold for at the stores, and they are very much disgusted with the amount of cream that they are putting into the cones. Some of the manufacturers got together, and they pulled out seventeen cabinets from the parks, where they were holding up the public on the cone question—they were charging too much for it. I say that is the way they are handling it—perhaps I should say this was the situation in the New England states during the year just closed.

Mr. K. L. Carver: It seems to me that this discussion of price regulation is timely, and I recommend that the Chairman appoint a committee of five, representing all sections of the state, and let them get together at the noon hour and talk over these things. In that way they can discuss the matter as they cannot very well do on the floor of the convention, and make a report to us this afternoon. I make that as a motion.

Mr. Miller: I second the motion.

The President: You have heard the motion, which is that a committee of five, representing all sections of the state, be appointed to consider the matter of price regulation, to report to the Convention at the session this afternoon. All those favoring the motion will say aye. Those opposed no. The motion prevails. I will appoint as that committee Mr. Platt, as chairman, and Messrs. Hage, Vahlberg, Hosking, and K. L. Carver.

The hour for noon adjournment has come, gentlemen, and we have run over a little bit. There are some

gentlemen here who have obligations in regard to luncheon, and I feel that we should not continue this session longer. The afternoon is pretty long, and if we just determine to do so, we can cover practically everything that we have left. I wish, however, that you would try to be here pretty promptly at two o'clock, as the afternoon will be a full one in any event. If there is no objection, the convention will be in recess until two o'clock.

* * *

FOURTH SESSION.

Thursday, January 13, 1921, 2 P. M.

The Convention was called to order by the President.

The first subject of the afternoon's program, coming over from this forenoon, is a talk by Mr. George E. Platt, on "Uniform Cost Accounting." Is Mr. Platt in the room?

"UNIFORM COST ACCOUNTING,"

By Mr. George E. Platt, of Los Angeles.

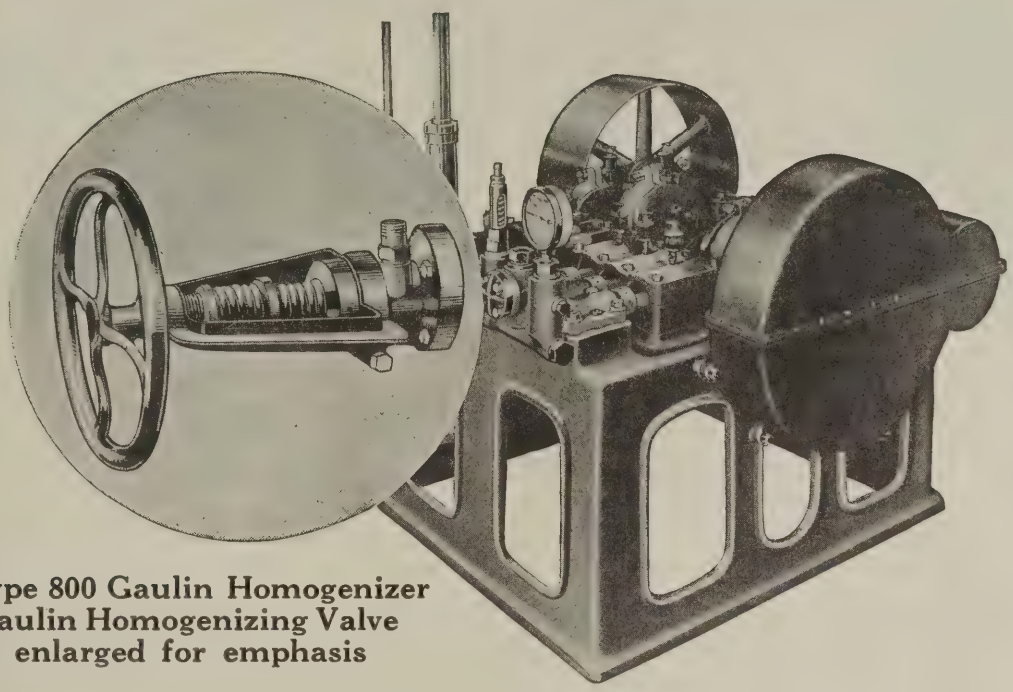
Mr. Platt: Mr. President, and fellow members of the Association: When the question of cost accounting was brought up in our little organization down South, it came about under a request by me that we ought to standardize, and the thought was that we would be more intelligently able to make comparisons, when we talked of the various elements that enter into our product and its cost, if we adopted a uniform cost accounting system. I little thought then that Mr. Carver would be putting me down for a paper upon the subject, because it was really more of an inquiry on my part than from any knowledge that I possessed of the proper method of cost accounting. In fact, I have recently taken over more of the active management of our ice cream business, and we are looking for openings.

The idea has grown on me that we ought to have everything standardized, whatever we do; that the growth of the industry will come about by each one knowing approximately in what manner the other man conducts his business, and if he has shortcomings in that direction, he will be able to straighten them out, so that the godos will be of better quality, going to the consuming public, and that we will get further.

Really, Mr. Chairman, I haven't anything to offer on it. I just wish to start a discussion, or to put a thought in the minds of the members, as to the importance of having co-operative action in every line. If there is any advantage in an organization, it is from getting the other fellow's ideas. That is most certainly a very important point. I should be very glad if the members will take up the question of cost accounting, and submit an ideal plan, or, further than that, to be brief about it, I move that we have a committee appointed along that line, if it needs the approval of the members here, to ascertain the best method possible of keeping a uniform cost accounting. And, as there is a great deal more of importance to come up than anything that I could say to you, I will stop with that motion.

The President: This subject, gentlemen, lies very close to the basis on which you must depend for results in your business. If you expect to keep your finger on the pulse of the business and know what you are doing there is probably no other way of doing it except through the medium of a cost accounting system of some kind.

Mr. Wilson: I have not heard the motion seconded, Mr. Chairman, but I think it will be all right to discuss it nevertheless. I cannot see any need of a committee on cost accounting. The National Association has adopted what I think is an ideal system of cost accounting. They have gone so far as to have all the forms printed, and will furnish them to any member of the National Association. My company is using the form now, and I know two or three other companies in the state that are using the forms with great success. I think if all the members would adopt uniform forms, when they do come to these conventions they could compare their costs and see where they are perhaps extravagant in some department, and could cut down.



Along the lines of co-operation, I think this is one of the means of getting co-operation with your fellow manufacturer—by seeing that your competitor has a good system of cost accounting, so that he knows how much it costs to make a gallon of ice cream. When he does, he is not going to be so anxious to cut prices. And if there is a new firm starts up, that may cut into your business, go out and see them, and see that they have a proper cost accounting system. We might go a step further, and before he bought his machinery, show him some of the costs of making ice cream.

I would like to see all of the members of this Association join the National Ice Cream Manufacturers' Association, and I would like to see them adopt that set of forms that the National Association has gotten out.

Mr. Platt: Mr. Chairman, I think it would be in order for me to withdraw that motion, if there is a method already worked out by the National Association, whereby they have a uniform blank system. I was not aware of that, and I had it in mind that it would be very good for this organization.

The President: I will say that the National Association has not adopted any particular form, if I understand it aright. I think perhaps what Mr. Wilson refers to is this: The 1919 National Conventino had presented to it a cost accounting paper, and set forth in that paper where six or eight different cost sheets, entering into the total makeup of a system of cost accounting, on which the author had devoted a good deal of time and study, and I think was perhaps the result of the work in his own plant. Those sheets were published in the 1919 convention report, that is, in pamphlet form, and they were set out in full, and if I recollect correctly, Mr. Wilson will correct me if I am in error, the National Convention authorized, or at least the board of directors did, the printing and carrying in stock of that set of forms. Perhaps it has been amended some since then, but they do carry in stock a printed set of forms for the assistance or use or study of any member of the Association who wishes them, either to use in his own business or to use in studying and developing and adopting a form that is suitable for his business. And those are obtainable at any time by writing to the Secretary of the National Ice Cream Manufacturers' Association. Then at the last annual convention in October of 1920, the subject of cost accounting was brought up again and given considerable attention, and there was a talk there on the line of whether the National Association should employ a firm of expert accountants, of wide reputation and high standing, to undertake the work of bringing the business of the different members under a uniform cost accounting system. The idea was that the representative of this firm would go from state to state, call on all the members of the National Association, and undertake to inaugurate a system of bookkeeping and cost accounting for those different members that would enable them to come under it. There were not very many advocates of that system. It received considerable discussion, and the buck was passed up to the directors and the officials to study and take such course as they might see fit,

The Most Important Feature to Look For
When Buying An Homogenizer

The Type 800 Gaulin Homogenizer with Gaulin Homogenizing Valve greatly enlarged for emphasis

You install an Homogenizer principally to improve the quality of your ice cream. And any standard homogenizer will enable you to produce ice cream that is far superior to unhomogenized cream.

But there is only one homogenizer, and that is the Gaulin, which will enable you to produce the best possible cream. This is because the Gaulin alone possesses the Gaulin Spring Homogenizing Valve. This valve is automatic. When it becomes clogged with undissolved particles, the valve is permitted by the spring to slightly open.

The undissolved particles are permitted to pass and are squeezed and crushed in passing. Thus every particle of the mix is uniformly homogenized because the pressure under which they are homogenized does not vary.

Other homogenizers use a rigid homogenizing valve. When they get clogged by undissolved particles, the valve must be opened by hand and when thus released, the pressure falls. Furthermore, an attendant must watch the machine closely and this increases the labor expense.

Yes, be sure to get an homogenizer if you want to give competition a run for its money, by turning out a smooth, satiny ice cream; but when you get one, get the best—install the Gaulin with the Spring Homogenizing Valve.

Write for "The Story of the Homogenizer."

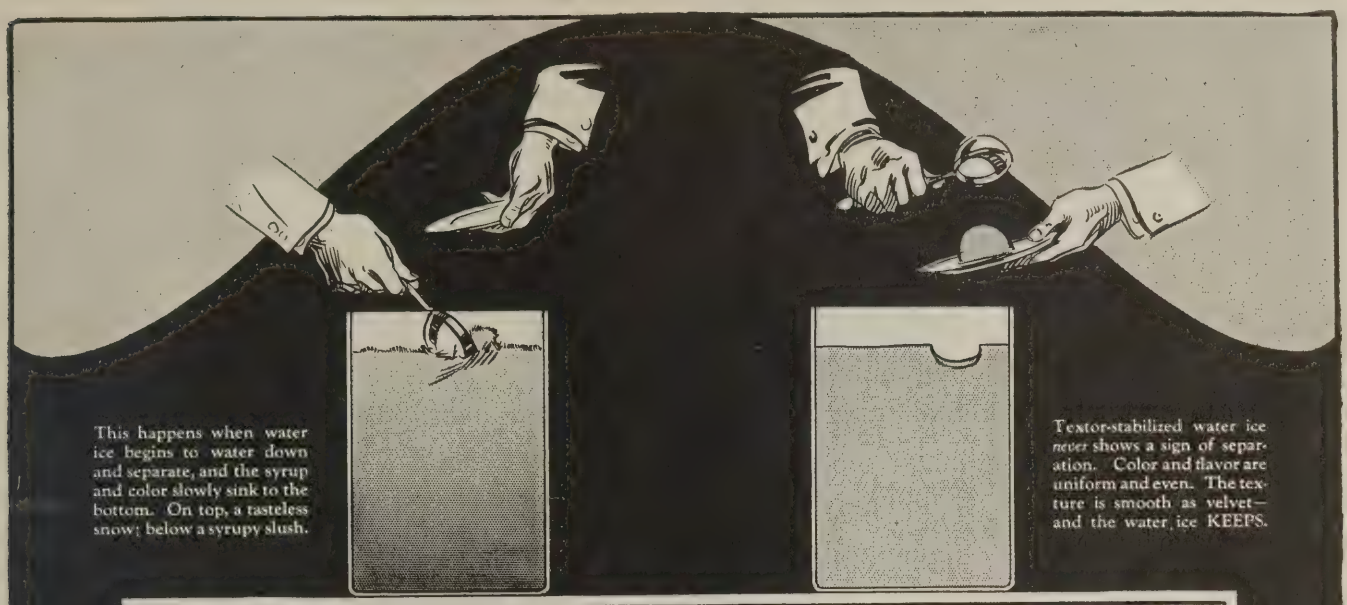
and it has been discussed some by way of correspondence among the directors and the different officials since that convention, but there is not by any means a united sentiment on the subject. I doubt if that plan will ever be carried out. To many of us, it looks impracticable. It would afford a fine, fat job for some firm of professional accountants, and the expense of it would be very large to smaller concerns, and the value not very certain. The larger firms all have their own accounting systems thoroughly developed. Nearly all the larger concerns are already using a cost accounting system, very thoroughly developed, and the majority of those larger firms have more confidence in their own system of accounting as they have developed it through a series of years in their own business, and adapted it to the peculiar conditions of their business, and have more confidence in their own accountants, holding the position of secretary or bookkeeper or accountant in their own firm, or the firm of professional accountants they may employ as advisers, than they would have in any itinerant accountant that might travel the country over representing the National Association. For that reason the larger concerns have not fallen for the plan very much, and the smaller ones have not and could not, because it is too expensive for them, as a rule.

Those seem to be the reasons why the plan has not met with any very great favor. But there is a good deal of sentiment of accomplishing, as far as they can, among the members of the National Association, some results by an interchange of ideas and forms and systems, each fellow showing a disposition to give the others the benefit of his own experience and what he has ascertained and developed in his own business. And it is certainly an excellent idea to do that—exchange the forms that you are using. If I could have the forms that are being used of cost accounting in a dozen very successful firms, I know I could get a good many pointers from them to fit in with my own system. The same would be true of others. And it is question among a good many whether, by co-operative teamwork among the members of the Association itself, we might not accomplish more in developing a system better adapted to our peculiar situation and the peculiar conditions of our business, and perhaps more practicable and much less expensive, than to pursue the other course. So I have talked around the subject in that way, to illustrate, as I understand it, about the status of that question as it now stands among the members of the National Association.



I am a thorough believer in cost accounting in every sense almost, and I don't see how a firm can do business and not have a cost accounting system sufficiently developed to give that firm the condition under which it operates in the line of goods in which it is handling, promptly and in full detail, segregated, and with the cost of every step in the process, from raw material down to deliveries and the collection of the proceeds of the business, so that they will know what every step in the whole operation cost them, not as a whole, necessarily, though that is all right, too, but to know what the costs are per unit of every step in the process. Otherwise you are more or less in the dark. You may know what your total results are for a month, but do you know the things that you need to know? If your results are not satisfactory, where is the fault, where is the defect, where are they lacking, where is it possible to improve? If you had that all segregated into an analysis of costs, under a system that would show the unit cost of every step, and those matters were shown in parallel columns both ways, in each period, so that those things would be accurately shown and in detail, you would very soon know where the strong point was or where the weak point was—where you are excelling in average results and where you are falling way below, in efficiency, of what you ought to be accomplishing. Any cost accounting system that does not give you the details in just that fashion, but gives you just the sum total of the result on the month's business, say, is worth very little, according to my estimate. Let us hear some further discussion, gentlemen, of the subject. Would it be interesting to us to know how many of our members, what proportion of our members or how many of them, are maintaining a cost accounting system, more or less complete? If you are not interested in this subject, gentlemen, we will pass it. But certainly we ought to be interested in it.

Mr. Miller: Mr. Chairman, I think we are really all interested, if we would just cut out that bashful feeling about getting up. And, in fact, I rather encouraged the Los Angeles crowd this morning in trying to draw us out.

We are interested in this question of cost accounting. But the idea of my suggesting anything on that is impossible, because my mind does not run along lines of bookkeeping, so that I could not offer very much on it, except that I see the necessity of it. To my mind, there are only three operations that we do—we make ice cream, that is, we buy the material, and we have got our material cost and the selling cost, and under those three heads every expenditure we have can be grouped, and we certainly ought to do it, and I believe that our bookkeeper has a system showing accurately the material cost, and our Mr. Fulmer has kept a record now for several years showing absolutely everything that goes into our mix, and we can look back to the corresponding month last year, or any time, and get accurately the material costs. Then the next thing is to know the yield out of that. I never liked the word "swell" that they talk about, and I never like to use it, or the word "air", even among ourselves. Someone discovered that the reason why it increased was the air we put in, and that has been very much abused, because we really do not gain anything in the nature of freezing ice cream, but it is the yield we get, and I would use the word "yield"—we ought to have a cost accounting system that would show that and base our manufacturing cost on that, and that should be so kept that we would know the total cost, the number of gallons we make, and divide one by the other and we would get the unit cost. Then we have the much discussed selling cost, that includs the delivery of the product, it includes advertising, it includes depreciation and overhead, and all those things, and if you want to subdivide it more finally do so, and separate the elements of those—suppose you keep accurate cost of your depreciation, which we know is a very large item. And so I might go on.

I wish I might be able to suggest something that would be helpful upon the cost accounting matter, because, as has been said, we really cannot work together unless we do have something similar in cost accounting, and Mr. Wilson has said that we would always rather have competitors who have accurate cost accounting, because that keeps us from doing some things in the last analysis.

I feel that there are those here who have lots of information to give us, and I am an earnest seeker after knowledge, because it is one of the most necessary things we have. It is our opportunity to keep our finger upon the business pulse. If you are going to run a successful business, you have got to know it, and to run the decimal out to the third or fourth figure, if

This happens when water ice begins to water down and separate, and the syrup and color slowly sink to the bottom. On top, a tasteless snow; below a syrupy slush.

Textor-stabilized water ice *never* shows a sign of separation. Color and flavor are uniform and even. The texture is smooth as velvet—and the water ice KEEPS.

Water Ices That Keep

WITH TEXTOR you can make water-ices that will keep for weeks without a sign of icy crystals, or separation, or watering down — you can make water-ices that dealers can repack repeatedly until every last bit is sold. And these water-ices have that velvety-smooth, firm body and even texture which heretofore has been an unattainable ideal. They are absolutely without grain, they NEVER contain icy crystals, their consistency remains perfect—they NEVER separate.

Water, sugar, fruit or flavor plus TEXTOR make a product entirely different from the ordinary water-ices or sherbets. TEXTOR binds these ingredients in one firm, smooth blend and prevents separation.

With TEXTOR your water-ices will easily pass any reasonable test you care to make. They will positively permit melting down and repacking a dozen times. They can be shipped to any distance with the assurance that they can be repacked on arrival, and when the can is opened, the water-ice will be *perfect.*

need be. It is very stimulating to make comparisons. It shows us where we can increase efficiency on first one line and then another.

I repeat, Mr. Chairman, that I am sure there are many here who can give us accurate information, and if they get started talking about this subject, they will be just as active as they were on some of the others.

Mr. Wilson: Mr. Niebling, who got up those forms, is one of the best business men in his business in the United States. He was formerly a banker, and went into the ice cream business in Rochester county; in 1916, at Atlantic City, the National Association appointed a committee on cost accounting, but could not get any report from it, and President Gardiner, of Baltimore, delegated Mr. Niebling to get out a set of forms and prepare a paper. The system isas simple as A. B. C. It would cost the manufacturer a lot of money to go to a printer and get those forms, those sheets printed, while the National Association gets them printed in a big bunch and supplies them to you at a nominal cost, and I should think that would be the easiest way to adopt the system and after that get the forms and see what improvements they can make—and they can easily change them. I am sure we would all profit by having the members of our association here write to Mr. Lowenstein, the secretary of the National Association, in regard to that cost accounting system.

Mr. Smith: Mr. President, it occurs to me that some of us might be in a position where a cost accounting system such as Mr. Wilson has suggested might not be applicable to our business. My business, for instance, is not solely the manufacture of ice cream, but is milk and cream as well. I am very strong, however, for a cost accounting system. I took over from my experience as office manager in the automobile business, a cost accounting system which fitted over to my present business, and I am able to accurately determine my costs on not only the ice cream manufactured, but also all the other departments. I have all my business segregated departmentally, and I am able to tell the manufacturing and selling cost for each different department in my office, and I find it a great help in every way, in determining whether or not I am realizing a sufficient amount of gross profit, and whether or not my expense is eating up too much of my gross profit. I think a cost accounting system, in whatever line we are engaged, whether strictly the wholesale line or any other line, such as mine, is a very important element.

The President: In response to what the gentleman says, I take it that he, as well as several other members of our association, are engaged in several different lines—you may sell, milk, cream, and butter, as well as ice cream—and it is an easy matter, where there is an overlapping between known departments or lines of business, to put out and apportion certain costs that may be joint, like your overhead, your depreciation, and any other line of costs that may overlap and be applicable to, say, both ice cream and creamery products, or ice cream and butter, or ice cream and milk and cream, by just a little observation or study. In that way you can make a pretty close approximation at a fair division of these overlapping expenses, like overhead and so on, so as to judge the approximately correct or fair portion of those things that could be noted against the ice cream or against the other different elements of your business. The item of depreciation occurs to me as a very important item, that I know some firms do not adequately understand nor appreciate the importance of, or the bearing it has or the figure it cuts in your business. The man who deceives himself and thinks that all he gets in money collected back from the sales of his goods, after he has paid his help and for his raw material, is not profit, lacks a whole lot of being a business man, and he will lack a whole lot, at the end of five or ten years, of being where a business man ought to be that is doing the business that he is doing, and I take it that hardly any modern business man needs to be reminded of that. But there are some features of depreciation that I don't think some business men adequately understand. In some lines of business, the same class of equipment in a plant doing one line of business would not call for a depreciation rate half as large as the same equipment might in another line of business. That is a thing we do not always recognize. The ice cream business and the milk business, and such lines of business that are wet in their nature, where there is exposure—the conditions that prevail in those lines do not prevail in all industry, and they operate to deteriorate equipment many times faster than the same equipment would suffer under other conditions. That means that the depreciation in an ice cream plant and in some of the forms of dairy products plants, necessarily has to be very much larger to get you out of the hole, to take care of your replacement if you expect to do business year after year. If you are only in business for two or three years, and expect to make your clean-up and get out, that is not so serious. But there is a different situation with us—it presents a very serious and a very burdensome thing.

Another point of difference is often overlooked. These are points you will find are recognized, if you ever have occasion to confer with the Federal authorities, when it comes to your income tax returns, etc. They are onto the job, and they are looking at the matter of accounting from their viewpoint in the matter. It is up to you to look after yours and from your viewpoint. They will take all they can get. They are collectors of revenue for Uncle Sam. You are entitled, the man who operates a business that runs twenty-four hours in the day, or eighteen hours in the day, is entitled to a depreciation at a rate exactly proportionate to the number of hours and days he operates, as compared with the man who operates his equipment only eight hours a day. Did you ever think of that? The man who operates twenty-four hours a day is entitled to depreciation, and he must take it if he expects to have a fund sufficient for replacement, three times as large as the man who operates his plant only eight hours a day. There are lots of little things like that that business men, when they get down to a detailed investigation of things, will not look into. Perhaps they will say, "My book keeper gives me the results at the end of the month, and it looks pretty good, and as long as I can see it in cash, why, it is drawn out, and maybe it is spent in a good many of the things that go to make up the high cost of living, and that is enough." Why, in that way, we are deceiving ourselves, if that is the only conception we have of what we are getting out of the business.

Is there any further discussion of the subject before we pass to the next subject? If not, the next on the afternoon's program is a talk by Mr. W. B. Hage of "The good of the industry."

The Good of the Industry.

By W. B. Hage, of San Diego.

Mr. Hage: Mr. President, and ladies and gentlemen: I think that my discussion in regard to "The Good of the Industry" has been so largely discussed here since we have been in attendance at this convention, that I am in a rather bad fix. But I have three topics noted here, three points.

What Is A Special Flavor?

By W. B. WOOD, St. Louis, Mo.

The special ice cream flavors are the best bet the ice cream manufacturer has to-day. This is a field that is virtually untouched, and when you speak of special flavors we take it for granted you mean a "special flavor". In other words, one could not call vanilla, orange, lemon, strawberry, etc., special flavors, and there is no way by which you could make a specialty out of a true flavor.

W. B. WOOD

I can better explain my point of view by referring to our own specialty, which we call "Yum Yum." This is a flavor unlike anything else on the market, but a special flavor is like everything else on the market, inasmuch, as it takes something to sell it.

There are certain classes of ice cream people, just the same as there are certain classes in every line of trade that work along the lines of least resistance. Sometimes these people make a good living,—sometimes they make money, but many of them could make it easier and quicker if they would get out and push a specialty. They would be building up a business that would belong to them, and on which they would have no competition.

You can take, for instance, the bottlers of Coco-Cola. Every soda water bottler has seen these people sell one case of Coco-Cola and give the man a case of strawberry to get him to take it. At the time this looked like a piece of foolishness, but it develops in after years that it was money and time well spent. This would apply to a specialty in ice cream.

You are building up something for yourself on which you have no competition. We have gone to a whole lot of trouble and spent a whole lot of money on research work to get out this special "Yum Yum" flavor. We believe it would pay every reliable ice cream manufacturer in the United States to investigate the merits of this particular flavor.

If he don't like it, then look for one somewhere else on which he could make a specialty. Then confine himself to this specialty and vanilla. At present every ice cream manufacturer is selling vanilla cream, and then he has about a half dozen flavors, such as strawberry, orange, cherry, lemon, etc., which he sells a little of. He calls these other flavors, aside from vanilla, "special flavors," but this is not the special flavor I am talking about, and these are not the special flavors it is going to pay him to push.

Let an ice cream manufacturer get after this specialty business once and learn it. Let him paint his trucks "Yum Yum." Let him paint his house "Yum Yum." Let him distribute his advertising matter, etc., in the way he should. He will be surprised at the results.

I realize the fact, it is hard to induce ice cream manufacturers to do this, simply because they have never seen the other fellow do it, and the ice cream trade, like every other trade, are prone to follow in the paths already established.

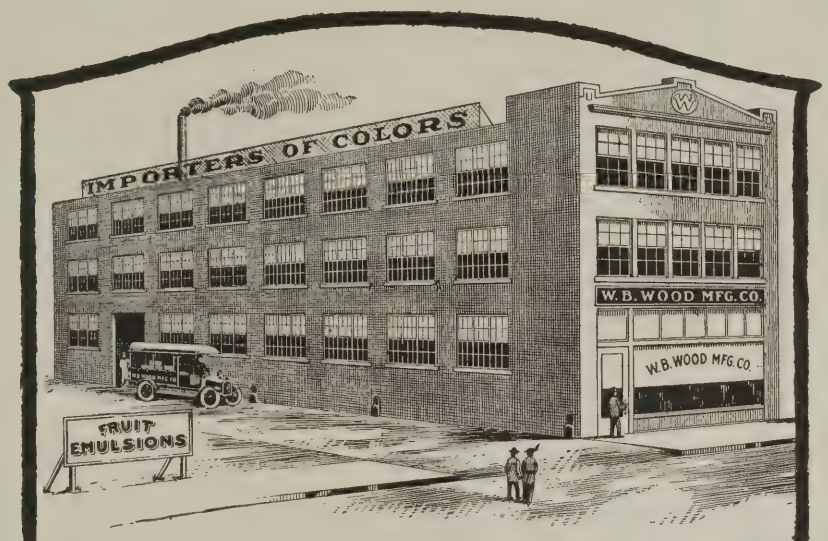
GET AN ASSOCIATE MEMBERSHIP IN THE NATIONAL DAIRY ASSOCIATION.

The recent decision of the directors of the National Dairy Association to accept associate members to the organization, offers an opportunity to every one engaged in any branch of the dairy industry to take an active share in the great work this mutual organization is carrying on.



While the National Dairy Association was organized primarily to stage the great annual National Dairy Show, it offers a medium under which all the diversified associations can unite for the good of the industry, and it provides a ready means for promoting any practical activity which will benefit the great dairy industry.

The fee for an Associate Membership has been placed at the nominal figure of $5 a year, and entitles the associate member to an active voice in any of the meetings of the National Dairy Associations. With the membership five tickets of admission are given to the National Dairy Show. A certificate of membership is issued to each associate member and it is hoped a framed certificate of membership to the National Dairy Association will soon hang on the wall of every creamery, ice cream plant, milk plant, cheese factory, etc., in the country, not now a life member.

The dairy industry gives you your livelihood. If you will help support it by joining the National Dairy Association, you will be helping yourself and at the same time help your brother members of the industry.

If you want the dairy industry to secure the recognition to which it is entitled, if you want to help dispel the ignorance about this great industry that now exists in the minds of the public, if you want the persecutions on the part of city officials and newspapers to cease, if you want to improve the producing end of the business, get busy and do your bit—apply for an associate membership in the National Dairy Associatioon. Address your applications to this paper or to W. E. Skinner, Secretary National Dairy Association, temporary office 4th and Robert Sts., St. Paul, Minn.

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want Department.

THE NATIONAL DAIRY SHOW.

By W. A. McKerrow, St. Anthony Park, Minn.

One of the greatest educational institutions known to the dairy world is the National Dairy Show, to be held the second week of October. We are indeed fortunate in procuring this great institution to assist in developing the new dairy regions which lie within close proximity to the Twin Cities. Minnesota is the greatest butter state in the American Union, both from the point of production and quality, with more cooperative creameries than any other three states. The growth of dairying will depend largely on the opportunities afforded in the way of more economical production and manufacture of its most important article of food. The National Dairy Show should play a very imporant part in this development.

More economical production lies at the foundation of successful dairying and the increased number of bred-for-production dairy cattle is a necessary part of this development. The National Dairy Show will assemble the various breeds of dairy cattle which are the most perfect specimens from the standpoint of showring type as well as ancestry, which stand for production because the breeding of each animal has been carried on with the greatest care and judgment.

It is estimated that not more than three per cent of the dairy cattle in the northwest are of pure breeding, therefore, there is great opportunity for the introduction of a better class of dairy cattle, which means greater profits for the labor and investment on the average farm. The average cow in the northwest is estimated to produce about 190 pounds of butter per year, while the cattle which will be assembled at the National Dairy Show will have an average butter production—either the individual or a compiled list of the ancestry—of over 600 pounds. This is an example that every farmer in the northwest should seen and study carefully at the coming National Dairy Show October 8 to 15.

A complete exhibit of cow testing association cows may be seen, showing the importance of better feeding, care, and management, which is brought about by keeping records of the dairy herd. With a very carefully prepared exhibit, the use of the purebred sire is demonstrated by fifteen years' work, starting with a common cow and building up by the use of purebred sires, tripling the profits by greater production per cow. The message of better feeding and more economical production will be demonstrated throughout the entire dairy cattle exhibit so the average farmer can grasp the idea of modern dairying in its various details.

Dairy farm equipment exhibits will be well worth earnest study. These will show the economical use of these modern methods in the most intensive forms in the various types of dairy barns and dairy houses.

Local creameries, cheese factories, condensaries and other types of dairy product manufacturing will have every opportunity to inspect the most modern machinery for their use, and will be able to learn the details by contact with experts engaged with these displays. If the northwest is to continue to boast as leaders in the production of dairy products, it is necessary to keep abreast of the times in our manufacturing ideas. Large and interesting exhibits of dairy products demonstrations on the value of these as food may be seen.

The why of the National Dairy Show and its importance to the northwest cannot be summed up in a few words. Its first importance is its educational value to the men now engaged in the industry and those who expect to become dairymen sooner or later. In fact, there is no section of the country in America which holds greater possibilities for the dairy cow and her products. We wish to show the men engaged in the dairy industry over the various sections of the United States upon their visit to the northwest that we have a country which is interested in and is doing a great deal to develop this business. By the interest and enthusiasm of our people, we can prove that we are leaders in our vocation, so let every man take a great interest in this greatest of all educational institutions for the development of dairying. Boost and advertise the National Dairy Show by being in attendance the week of October 8th-15th.

CHANGE IN CONVENTION DATES.

In order to avoid a conflict in dates, announcement is made by M. T. Cochran, Secretary of the Oklahoma Association of Ice Cream Manufacturers that the annual convention of this organization will be held on Dec. 12th, 13th, and 14th. Following are the officers and committee members of the association:

President: J. B. Porter, Tulsa; Vice-President: R. G. Colvert, Ardmore; Secretary-Treasurer: M. T. Cochran, Altus; Executive Committee: S. P. Lay, Tulsa; D. J. Carithers, Wichita Falls, Tex.; F. G. Christen, Muskogee; W. L. Colvert, McAlester; O. C. A. Rathbun, Fairview; Legislative Committee: C. W. Radway, Stillwater; Carl Glitsch, Oklahoma City; J. W. Parker, Enid; Express Committee: J. A. Oxley, Poteau; C. A. Burns, Ponca City; L. K. Jones, Lawton; Advertising Committee: D. F. Solliday, Oklahoma City; E. N. Ward, Ft. Smith, Ark.; F. J. Bouvy, Tulsa; Delegates National Association: D. F. Solliday, Oklahoma City; Delegates Farm Congress: J. W. Parker, Enid; M. D. Newton, Cushing; Entertainment Committee: W. E. Walthers, Oklahoma City; W. M. Hawk, Tulsa; Arthur Marshall, Chickasha; Scoring Ice Cream Committee: Prof. A. C. Baer, Stillwater, R. W. Brice, Muskogee; R. F. Pantier, Shawnee.

ICE CREAM SALES DOUBLE.

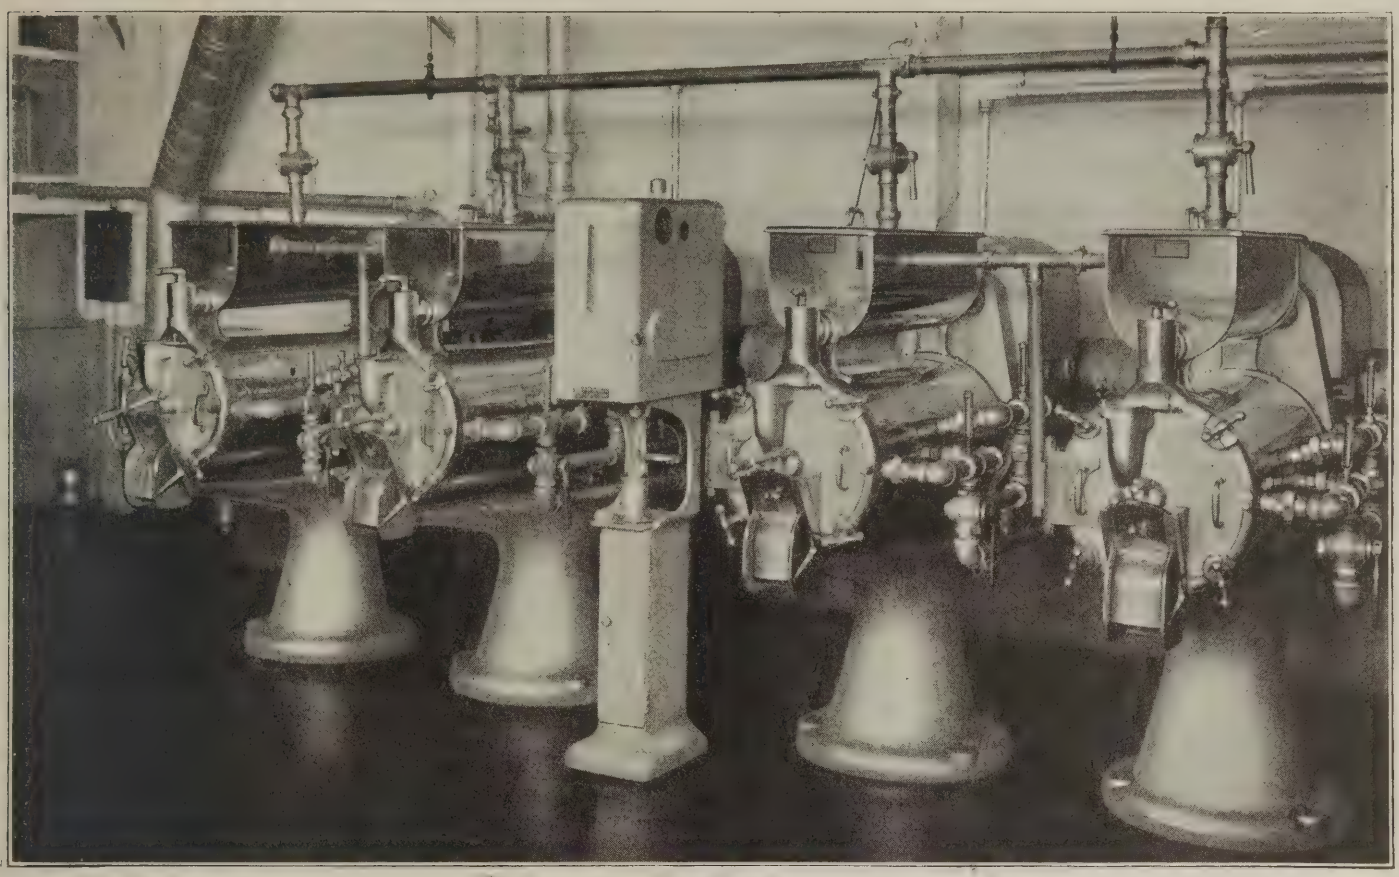
Merril, Wis.—Twice as much ice cream was sold this year as a year ago in this vicinity, owing to the extremely hot summer.

According to local manufacturers, this fact together with the short pastures has resulted in a boost in the prices of all dairy products.

The price of ice cream a year ago was $1.25 and before the war, 75 cents. The present price ranges from 90 cents to $1 a gallon. Local manufacturers do not look for a further drop in price.

Cheese dealers are, however, not so confident about the present price scale, believing that a sudden drop may come at any time.

The price of butter fat paid farmers is 39 cents a pound and creamery men say that the price will remain from 39 to 45 cents during the fall and winter.



The price paid for butterfat last spring was 26 cents but the increase since is claimed largely due to the ice cream sales.

YOUNG PARADERS DEMAND 5-CENT CONES.

Des Moines, Ia.—More than 500 children between the ages of 6 and 15 years marched through the downtown section of Des Moines today protesting against the high price of ice cream cones. Most of the children carried placards inscribed: "We want nickel ice cream cones."

A local newspaper furnished the kiddies with free ice cream after they had finished parading.

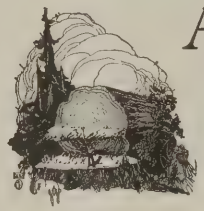
Anheuser-Busch Sales Corporation, New Orleans Branch, New Orleans, La.

Anheuser-Busch Use Progress Freezers In Big New Orleans Ice Cream Plant

And, look at the size of the Freezers. Four of them. Each a one-hundred-quart capacity. They are individual motor drive horizontal brine machines. Notice the double brine connections on the side of the cylinders. Pay particular attention to the beautiful appearance of these wonderful modern Freezers. Anyone would surely be proud of a freezing department like this one.

Progress Horizontal Ice Cream Freezers, like their brothers, the Vertical Freezers, have gained a sterling reputation for their honest work and value. You will find them in large and small ice cream plants in all parts of the country. They are designed and built by men having long experience in the proper construction of ice cream freezers. All you need to do is to give a little time to the study of this efficient construction to convince yourself of the reasons why large concerns are equipping with these Progress Freezers.

The one-hundred-quart size has the special advantage of large capacity. This means a saving in labor, power and floor space. It gives twice the capacity of a fifty-quart machine—*with no loss of time.* The large size of the intake for the mix, and the outlet for the frozen cream, doubles the speed of the flow. And it freezes at the same efficient rate of speed. If you have the business to keep large capacity freezers busy, you ought not overlook the saving this machine will give you.



The squirrel cage dasher in each one of these machines gets you all the overrun your business can profitably stand. In fact you have to watch it carefully or you will get too much. Good ice cream, the kind which advertises itself, ought not have more than one hundred percent; and you are better off to hold it down below this.

Our "D" shaped coil, wrapped around the freezing cylinder, equipped with double brine connections, speeds up the work of freezing. The scraper blade is made in sections, instead of one long blade on each side of the dasher. You don't drag any oil through the cylinder when you take the dasher out for cleaning. In fact, Progress Freezers have every possible advantage that a modern Ice Cream Freezer should have. Study it over.

Why Redwood *should be used for* Ice Cream Cabinets and Refrigerators

Properties which make Redwood unrivalled for these purposes

ABILITY to keep heat out and cold in, is the test of refrigerator worth. This is directly dependent on the insulating quality of the materials, from which it is made. After experimenting with many kinds of wood, leading manufacturers of ice cream cabinets, refrigerators and cold storage plants have adopted Redwood for the following reasons:

Redwood is a remarkable insulator

The structure of Redwood is distinguished for the regularity in size and shape of its sap cells, and for the uniformity of texture they give. When the sap is dried out, these cells become air pockets—layer on layer of them—which act as almost perfect insulators to heat. With a freezing temperature on one side of a Redwood board, the other side remains at room temperature—does not sweat.

Redwood properly dried is "still" wood

No soft wood warps, swells or shrinks as little as properly dried Redwood. Wet or dry, Redwood "stays put"—joints tight—no bulging or leaking.

Redwood does not rot

Every fibre of Redwood is impregnated during growth with a **natural** preservative which prevents decay from moisture. Acid and alkali solutions, salts and oils do not destroy Redwood. Insects and worms do not attack Redwood.

Redwood is easy to work and can be given any finish desired

Soft, light in weight and free from knots, splits and other blemishes, Redwood can be manufactured to any dimensions desired with a minimum of labor and a minimum of waste. Its uniform cellular structure provides excellent surfaces for holding paint or varnish—enables Redwood to be given any finish desired.

A NEW PUBLICATION.

Volume 1, Number 1 of a spicy little house organ called "Sx," and edited by Miss Puritan Brand, has reached our desk. It is full of interesting material and we judge that the editor is a good judge of human nature. He evidently knows what people like to read and he tells it in an interesting way. The publication is issued by the Essex Gelatine Co., Boston, Mass. Here is a sample of one of the editor's stories:

Keeping In Tune.

This is a wonderful day! A wonderful day of soft winds and warm sunshine! And this morning I made up my mind that I would drive into the City in my roadster, so that I might enjoy the freshness of the morning rather than suffer the close air that is usually found in a Boston and Maine coach.

So I hurried through breakfast and with full anticipation of the leisurely drive to town, I hurried to the garage. Usually the motor in my roadster responds at the first touch of the starter button, but this morning something went wrong; for the starter-motor churned and churned, but never a kick did the engine give until, when I thought that my battery surely would give out, off she went. But it was not a good healthy sound. There was no rhythm to it; rather, it kicked and backfired and hit on a couple of cylinders only—and it has six.

Visions of my morning ride into the City were rapidly vanishing when one of the garage mechanics asked me if he could be of assistance. He took the car out on the road for a test run and when he returned, after half an hour, the motor was purring with that pleasing staccato that is indicative of a motor in perfect condition. I asked him what he had done to it.

"Oh, nothing much," he replied, "the carburetor was out of adjustment, the timer points were soiled, and one spark plug was short circuited. I just put the machine in tune. You'll have no more trouble with it."

It is a great thing, that, to be in tune; to be in tune with one's self, with one's work, with the organization of which one is a part. And how easy it is to get out of tune!

There are times when things are bound to go wrong; times when it seems that everything that we do goes just opposite from the way we would have it. And then we get out of tune. And like the engine in my roadster, we kick and back-fire and buck and sputter. We lose patience, we become irritable. We call down the stenographer for omitting a comma, or the office boy for something that is not really his fault, or a salesman for not getting a certain order when he did everything that any one could do, or our associates because our work is behind, and the folks at home because dinner is not served right on the minute.

And then it is up to us to drop everything and to get in tune! To take a long walk in the early hours of the morning when we can walk slowly and alone. When we can listen to the songs of the birds, when we can see the sun come up out of the Eastern horizon in all its splendor and grandeur. For there is something in the early morning hours that is lacking in the remainder of the day; the stillness and the freshness of those hours invites us to get in tune, to get in tune with nature and with ourselves.

And then we go back to our work, to the duties of the day, with renewed faith and restored vision. Our work is easier, and the petty trials and annoyances do not bother us. We hit along on all six.

And just because we have placed ourselves in tune.

Three Glass Lined Milk Pasteurizers at the Snow & Palmer Co., Bloomington, Ill.—Milk is dumped upstairs, runs into tank suspended from ceiling, gravitates from there to clarifier, and thence into pasteurizers.—This dairy has one of the lowest bacterial counts in the country.

STEPPING OUT!!

This will serve to interrupt the series which we are running—to direct your attention to the greatest dairy event of the year.

IT'S the chap, stepping out today, who leaves the other fellow behind tomorrow—The Dairy Show at Minnesota represents the logical get-together of the year, when new ideas will be swapped for old—when you will be able to learn some new method of milk handling,—some new device which through economies gained in the course of the year, will pay the expense of your trip ten-fold.—You positively owe it to yourself this Fall as at no other time, to attend the National Dairy Show.

STEP OUT,—for Minnesota.

Tell your friends and neighbors you are going to the World's Greatest Dairy Show, Minnesota State Fair Grounds—October 8-15. Our booths Nos. 96-97-98.

HOOSIER WILD CATS

President, EDWIN J. SMALL, Indianapolis, Indiana

Send all communications to
H. A. STEVENS, Sec'y and Treas.
717 Railway Exchange, Chicago, Ill.

On Wednesday, July 13th, the writer, in company with our President, Mr. E. J. Small, attended a chicken dinner at Marion, Ind., which was held under the auspices of the Indiana Manufacturers of Dairy Products. Pleased to state that we were accorded every courtesy possible by both Mr. Moore and Mr. Holley, which gave us the first opportunity we have had to speak as an organization before a body of members of the Dairy Products Manufacturers. The writer was informed toward the close of the meeting by Mr. Moore that 20 per cent of the Hoosier Wild Cat membership was present. The enthusiasm shown by everyone connected with both organizations was such as will insure all of us a wonderful time at the annual meeting in Indianapolis.

Three new men applied for affiliation with our organization and their applications have been accepted. They are as follows:

Mr. E. C. Bishop, representing The E. C. Bishop Company, Industrial Accountants, Indianapolis, Ind.

Mr. C. M. Lewis, representing Westerlin & Campbell Company, Fort Wayne, Ind.

Mr. Geo. C. Anderson, Creamery Package Manufacturing Company, Chicago.

Prior to the dinner at Marion every one had access to the Marion Club's facilities, and a great many had a little game of golf, the writer being included.

There was no official announcement forthcoming regarding this meeting, as it was not fully understood that supplymen were to attend. Future events of this nature will obtain the necessary publicity in order to give our members an opportunity to attend them if they so desire.

Any of our members who have in mind supplymen who should belong to our organization will please submit their names at the earliest possible date.

Yours very truly,

HOOSIER WILD CATS,
H. A. Stevens, Sec'y-Treas.

RIECK BREAKS RECORD FOR INDIVIDUAL ICE CREAM ORDER.

Pittsburg, long famous for its steel tonnage, is now going after records for ice cream tonnage. When the Rieck-McJunkin Dairy Company filled a single order for 3412 gallons of Rieck's Ice Cream Saturday, July 30th, it broke all records of the territory and set a new mark which will probably stand for awhile.

Every year the National Tube Company holds a one-day picnic for all its employees and their families at Kennywood Park, a pleasure resort within the limits of Greater Pittsburgh. Their original order to the Rieck Company called for 2800 gallons of ice cream, cut and wrapped, ten slices to the brick. Then when the crowd gathered and the picnic management saw what confronted them the Rieck Company was asked if it were possible to cut, wrap and deliver an additional 600 gallons. It was possible; the resources of the organization were equal to the emergency and 612 gallons were delivered the same afternoon making a total order of 3412 gallons. Two hundred and fifty gallons of milk were also furnished.

Purpose of the Viscolizing Process

By K. D. SMITH, Sales Manager, Union Steam Pump Company

(Reprinted on Account of Typographical Errors Made in July Issue.)

THE manufacture of ice cream has long since ceased to be recognized as a mere business and has passed into the realm of industry, representing an unparalleled growth and investment of capital in promotion and installation of high class manufacturing equipment.

In the processing of unfrozen ice cream mix we but follow the almost inevitable rule that scarcely a single food provided by nature is fit for our present needs without a series of mechanical or chemical manipulations and it so happens that in the processing of milk constituents which enter into the manufacture of ice cream, that the modifications made in the natural product are confined almost exclusively to mechanical or physical changes and that the results brought about by chemical changes are for the most part to be avoided.

The Home of the Viscolizer.

The prime requisite in the preparation of an ice cream mix is to in some way effect as permanent and thorough emulsion as possible without disturbing the natural qualities of the milk, and above all else to have the butter content as finely divided as is possible and to insure its remaining in as perfect emulsion as can be brought about without resorting to any chemical change in any part of the mixture.

For industrial products, fats of any nature can be cut chemically so as to remain suspended or emulsified in the so-called solution but in the manufacture of ice cream of the most perfect quality, the butterfat must not in any way be disturbed other than to have the natural size of the cream globule reduced to at least one-third of its natural volume. There are two processes and two machines which will successfully effect this necessary change, the viscolizer and homogenizer.

Quite naturally the process carried out by these machines is known as viscolizing and homogenizing, and it is the purpose of this discussion to explain the simplicity of operation and ordinary detail of the viscolizer in its relation to the very intricate study of solution and emulsion. Milk or ice cream mix is a combined solution and emulsion, in which sugar is dissolved into a mixture of milk products in which there is, in true emulsion, the important constituent of milk —casein.

The ice cream maker is concerned principally with the treatment of the butterfat in the mix, and it was discovered long ago that if whole milk was subjected to high pressure and forced through any kind of a fine orifice that the butterfat or cream was more or less thoroughly emulsified and would not thereafter separate as is its natural tendency in the untreated state.

The discovery of this possibility was at that time in no way related to the manufacture of ice cream, and had to do only with the enriching of milk with butterfat content of any desired percent.

The ice cream maker is to-day so well informed upon the possibilities and advantages of homogenized or viscolized mix that it is unnecessary to dwell upon this and we believe that with this concession the details of the machine and its operation are of vital interest.

On account of the construction of earlier machines and lack of real knowledge as to how the change was brought about or how a machine could be constructed so finely as to subdivide a cream globule having a diameter visible only through a high powered microscope, it was thought necessary for a long time to operate at excessively high pressure and that this high pressure really did exert some tearing or rendering effect upon the individual globule.

It was considered also that the orifice through which the milk was forced at this high pressure was so narrow that the cream globule did come in actual contact with the walls of the orifice and that the cutting and scattering effect was accomplished here. For a long time the theory was advanced that each individual cream globule, small as it might be, was enveloped in a kind of membrane or sack which was bursted by this high pressure and the liquid butterfat allowed to escape.

Theories and explanations in untold numbers have been advanced as to just how the subdividing of these minute cream globules is accomplished, how this caused the change in the apparent viscosity of the liquid and how this reduction in size, no matter how accomplished, prevented the natural separation of cream from the balance of the milk serum.

It has been conceded that there is no possibility of the narrowness of the orifice causing by any friction, rubbing or cutting effect, the subdivision of the globule. It is positively known that there is no enveloping membrane about the cream globule and it is further and equally positively known that the pressure, considered in itself, has nothing to do with the change brought about in butterfat structure by either the viscolizer or homogenizer.

In the viscolizer the structural details of the viscolizing device are radically different from any type of homogenizing device, but the results, as far as the subdivision of the fat is concerned, are the same and the ice cream maker has learned that the real essential object sought for in the treating of the mix is the subdivision of the fat. It is primarily necessary that the fat be divided fine enough to prevent its responding to influence of gravity and if the process is carried beyond this necessary point it will slightly improve the results but it has also been found with some machines used for this purpose that if the subdivision process is carried to an extreme, that the other more delicate and real essential constituents of the milk are

VISCOLIZERS TOO!

unfavorably affected and that instead of remaining in their natural perfect emulsion they have tendency to precipitate and to this extent unfavorably affect the mix.

The viscolizer was constructed and developed for the express purpose of subdividing the cream globules without disturbing the natural and perfect solution of the remaining ingredients and with this accomplishment, this process has been found to be a very desirable one as it brings about the desired effect upon ice cream mix and leaves open the possibility of treating cream to be used for other purposes, which markets are directly related to and followed by the ice cream industry.

The logical explanation of the reason for viscolized cream globules failing to respond to gravity in either the cream separator or in "setting" is that after a reduction to at least one-third of the natural size—no matter by what mechanical process—each individual particle of cream with its surrounding film of milk serum, considered as an individual unit, assumes so closely the specific gravity of the volume of milk that there is no tendency for it either to float or respond to the influence of centrifugal force. These are the simple facts of the case and have been proved by exhaustive study, endless experiment and minute observation.

The next thing of interest is how this is accomplished, and this is simply told, and we are sure understood, when we submit that the mix is forced through a very fine orifice at a speed equal to that of a rifle bullet—700 to 1000 feet of travel per second—and that this speed of travel has an ultra agitating effect upon the heated, and therefore liquified butterfat.

It is impossible to viscolize or homogenize cold mix. In the chilled state the globule structure has a great strength and will not respond to the agitating effect of this high speed. In the heated state, and we always viscolize or homogenize at 90 to 145 degrees, depending on composition of the mix, the butter structure is weakened and readily responds to the agitating or atomizing effect produced by passing this milk at this terrific rate of speed through a suitably constructed orifice.

It then develops that the pressure as far as the actual process is concerned, is really incidental and is simply the result of attempting to force large quantities of liquid through a small orifice.

If we do not have the pressure we cannot get the speed, and the pressure is, therefore, necessary but only in an incidental way and has nothing to do with the actual process of globule subdivision.

It must be conceded then that the old theories regarding the principles and causes of these machines must be disregarded and that any mysterious devices or theories regarding the operation must give way to common place explanation of a very simple process.

Following these principles, the viscolizer has been constructed along the most simple possible lines, and its construction is such that it will handle perfectly any product which will flow and special attention has been given by the manufacturers to the pump end of this machine, following established practice in pump building, resulting in a special pumping machine which will, with ease, handle not only a thick and viscous liquid, such as the heaviest cream or salad mixture, but will at the same time allow its use in the handling of a mixture containing great volumes of semi-solid matter of the same nature as cottage cheese or the congealed portions of frozen cream or condensed milk. The illustration and sectional view of this machine will at once appeal to the mechanically inclined operator and, as its distribution is universal, its pumping possibilities unlimited, its product controllable to any desired degree, it is especially interesting to manipulators of milk products who do not confine their efforts to ice cream exclusively.

It is this flexibility of operation and ease of control that recommends this process and this machine very highly to the ice cream manufacturer.

One of the wonderful features of the viscolizer is that it imparts to the mix the same desired and necessary effects that is given by aging, and this aging effect is produced absolutely mechanically with no trace of the chemical change which always accompanies natural aging or ripening. A viscolized mix retains all the natural characteristics of natural cream, except that the butterfat is transformed into a perfect and inseparable emulsion of increased viscosity, leaving the frozen product of uniform texture, improved flavor and devoid of the objectional sandy or icy characteristics in ice cream frozen from an untreated mix.

PERSONALS.

Mr. Roscoe C. Chase, manager Advertising Department, Davis-Watkins Dairymen's Mfg. Co., dropped in for a visit one day recently while returning from a vacation trip to various points of interest in Wisconsin. Accompanied by his family he toured "The Dells" country and reports a very pleasant time. Mr. Chase is chock full of enthusiasm for the coming National Dairy Show.

One of our good friends, Mr. Frank Hensley, with the Western Dairy Co., St. Joseph, Mo., reports a splendid business this year. Says he has been with that company for four years and that business is steadily increasing. They operate two Federal trucks and eleven Fords.

Mr. J. T. DeCoster, with The Consumers' Milk and Ice Cream Co., Beloit, Wisconsin, accompanied by Mrs. DeCoster and the children, stopped in for a chat one day recently. They were enjoying a motor trip, taking a few day's respite from work. Mr. DeCoster reports a splendid business by his concern.

MOUNTAINEERS HAVE ICE CREAM ORGY.

Uniontown—Tasting ice cream for the first time in their lives, Joe Jable and his three sons, residing in the mountains near Uniontown, disposed of sixty-one dishes of the delicacy at the first setting.

The quartet entered a local confectionery store and ordered "some of that stuff," indicating ice cream a man beside them was devouring. They continued until they had devoured fifteen dishes each; the father took one extra. Then they departed for home apparently in a happy mood.

THE ice cream manufacturers of thirty-five populous states will be within a thirty-six hour journey of 1921's two great *Exhibitions in the Service of the Ice Cream Industry.*

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—Wish to ask your advice regarding certain problems which have come to our notice lately regarding our ice cream. We are producing a 10 per cent fat, 13 per cent milk solids, 14 per cent sugar solids and total solids 37 per cent. We are using nothing but pure cream and skim condensed in our product and feel that we should produce a much better product than any of our competitors who are using butter and powder. We are aging this mix 24 hours or more and getting a 90 per cent overrun. We are using 20 pounds of the best gelatine we can buy to 2768 pounds of mix, using no improvers, homogenizing at 3000 pounds pressure. We are freezing at 0 to 5 degrees temperature, and then putting into hardening room which is held at 0 degrees. The product coming out of the freezer is very smooth but after hardening it has a tendency to become slightly grainy. We are more than willing to go to any expense to keep the product smooth. Have been trying to regulate the brine to 10 degrees but we cannot keep the overrun down and the time to freeze a batch is trebled. We are using a Gaulin homo and Ft. Atkinson freezers. Last week I had occasion to visit a plant 100 miles from here and as they did not have a homo I shipped up a can of our homo. Using this same homo that we freeze here the resulting product was fine and just what we are trying to produce. The difference was that they had an Emery Thompson vertical freezer and the temperature on freezer was 10 and hardening room 10 above. Would this be the reason for the difference in product? Our formula is as follows:

1448 lbs. 18 per cent cream; 880 lbs. skim condensed; 420 lbs. sugar; 20 lbs. gelatine. W. C. CO.

Reply: This grainy condition of your mix is undoubtedly caused by using too high a percentage of milk serum solids. I suggest that you reduce the milk serum solids from 13 per cent to 11.5 per cent. A high percentage of serum solids causes a crystallization of the lactose or milk sugar in the ice cream when it is subjected to a low temperature for some time in the hardening room. You will not notice this grainy condition when the ice cream is first made or a day old but you will begin to notice it if held longer. The reason you did not get this when the plant was visited was that the hardening room was not carried at so low a temperature and not stored for so long a time as in your factory. There could be no harm in trying to hold your hardening room at about 10 degrees to see if the difficulty can be eliminated in that way, but my suggestion would be that you reduce the serum solids and be absolutely safe.

The type of freezer has nothing to do with this grainy condition of ice cream. If you are not able to overcome the difficulty with the suggestions above I suggest that you write to me more in detail, stating just exactly what is happening to your frozen product.

* * *

Dear Sir:—I am assistant ice cream maker at one of the largest plants in this city and attend to all the testing and proportioning of the mix. I have several questions I want to ask you and would appreciate it very much if you could give me the answers to them.

We receive 20 per cent cream (homogenized) and has condensed skim milk added to increase the solids, its specific gravity is 1.040 by my lactometer. Does Babcock's formula (¼ L. + 1.2 fat) give a correct reading for solids in 20 per cent cream? In all the books I can get they say it is for milk from 0 to 6 per cent, and I was wondering if it would hold good for any per cent greater than 6 per cent.

Is there any way to test the total solids in the mix or frozen product?

Is it true that you cannot get a correct test for fat from homogenized cream?

In condensed skim milk (4 to 1) by adding 3 parts water to 1 part milk will it be normal and can you get a correct lactometer reading for solids?

Yours truly, A. E. Jr.

Reply: The lactometer cannot be used for determining the specific gravity of your 20 per cent homogenized cream nor can it be used for testing the solids in condensed milk.

The solids of these ingredients is the dry matter in percent so that if you have 100 pounds of your 20 per cent cream, you would have 20 pounds of butterfat providing it tested 20 per cent having a certain number of pounds of total solids or dry matter which you can determine by making a solids or dry determination.

This is either made with a drying oven and a chemical analytical balance, the drying being done at about 100 degrees or it can be made with an ordinary butter moisture apparatus, weighing exactly ten grams in the aluminum dish and then drying it slowly in the pressure oven or in a smaller butter moisture oven. When all the water is driven off the dish can be re-weighed on the butter moisture scale. Replace the ten gram weight with a five gram which will account for 50 per cent of the moisture then the balance of the moisture can be weighed on the moisture pans of the scale.

Subtracting the total moisture from 100 would give the total solids. In a similar manner you could determine the solids in the condensed skim milk. Whether or not the three parts of water and one part of condensed milk will give you a product equal in composition to regular skim milk will depend upon the solids in the condensed.

We have a number of times checked up the tests of a homogeneous cream or a homogeneous mix and we have found that we can make an accurate Babcock test of this product by centrifuging test bottles at a little higher speed and for a longer time. It is possible to check the per cent of fat within two-tenths per cent against a chemical analysis when the testing by the Babcock method is carefully done.

I am sure that with this information you will have no trouble in making the analysis of the two ingredients referred to and you will be able to standardize your mixes accurately.

* * *

Dear Sir:—I am writing for any information which you may have treating upon binders—fillers—fats or solids not fat relative to their effect upon the overrun in ice cream. Information to be used in the continuation of experimental work at this station.

Very truly yours, J. B. D.

Reply: I am sorry that I am not able to send you a printed bulletin from this station as the bulletin which we have in preparation is not printed. I suggest, however, that you go through the files of The Ice Cream Review, where you will find considerable information on this subject coming from me out here at the Oklahoma station.

Branches:—Vera Cruz, Mexico Windsor, Canada Dallas, Texas San Francisco, California

am not able to solve it completely. Our man is making a 1900 pound mix, which is as follows:

264 pounds butter; 1300 pounds of 3.2 per cent milk; 39 pounds of skim milk powder; 39.8 pounds of water; 237 pounds of sugar; 6 pounds of vanilla; 14.2 pounds of gelatine.

I find, on figuring this up, that this gives approximately 14 per cent fat, 8 per cent serum solids, and 34½ per cent total solids. From these figures you will see that this is a well balanced mix. The mix is all put in a vat and heated to 145 degrees, and homogenized. The pressure has been varied from 2000 to 3000 pounds. From the homogenizer the mix is run over a water conical cooler and coolled down to about 75 to 80 degrees. From this it is put in a vat and cooled down to 42 to 43 degrees with brine. The speed of the revolutions of the vat are normal, and the mix is aged from 24 to 48 hours.

Now this is the trouble. We can obtain 95 to 100 per cent over-run on a new horizontal 50-quart individual motor freezer, but when it comes to two upright freezers, one about six years old and one about three years old, we cannot get over 50 per cent over-run. The speed of the drive shaft of the freezer has been varied from 218 to 234 revolutions. The temperature of the brine we have varied from 8 to 12 degrees. We have varied the rate of inflow. And still we have not solved the trouble. We can get as much over-run on a mix six hours old as we can on one 36 to 48 hours old. We have tried using both Melloine and Gumper's and will say that we are just at a loss on what to do next. We sharpened the blades of the dasher and we tried putting in four gallons to six gallons of mix in ten agllon freezers. We have varied the temperature of the mix as it entered the freezer all the way from 40 to 55 degrees. The appearance of the mix would give us an indication that we had a dandy mix.

We can obtain our over-run on the horizontal, as I said before, but on these other two we cannot get the over-run. Some times on a 10 per cent mix we can get a good over-run on the upright machine. The butter which we use is a good grade of butter scoring about 89. Yours very truly, G. A. M.

Reply: I have your letter of recent date, and you undoubtedly also received my note which I attached to your other letter. I am sorry that I was not able to reply any sooner.

In reading over your letter and studying your ice cream mix as indicated I see no other reason why you are not getting the over-run expected except that the vertical freezers which you state are being used will not produce it. You stated in your letter that the factory had no difficulty in securing the over-run with the vertical freezers last year. It is possible that this factory did not pasteurize the entire mix like you are doing this year.

My suggestion would be that the factory get rid of the vertical freezers and install horizontal machines. I believe that the general experience of the ice cream trade has been that the over-run is more easily obtained with a horizontal than a vertical machine. Many factories, however, still retain the vertical machines for the purpose of making sherbet and water ices.

I shall be glad to offer any further suggestion at any time if you run across a problem which seems to give you trouble.

* * *

Dear Sir:—While with the —— Co., Oklahoma, I wrote you several times for advice, so I still feel that I may do so.

It seems that we cannot get a nice fresh taste to our ice cream, when eating, it seems to leave a taste in the mouth that a nice fresh piece of goods should not do, and with the following information, I hope you may suggest something that will remedy this.

We are using mostly sweet cream and whole milk, on a 1000 pound mix put up yesterday we only used 25 pounds of sweet butter and 44 pounds of powder. We are figuring 9 per cent butterfat, 11 per cent milk solids and 12 per cent sugar. Our ice cream maker does not cook his gelatine, and would like to have your advice on whether it should be cooked or not, and how long it should be cooked.

I am enclosing herewith a blank mix sheet, and would be glad if you would fill it out, using the 155 pounds of 28 per cent cream and 586 pounds of 4½ per cent milk, using the above mentioned percentages of butterfat, solids and sugar, mix to be 100 pounds. We are using Gumpert's Improver, and some purity powder. Yours respectfully, N. B. R.

Reply: I have carefully analyzed your ice cream mix, according to your suggestions. I have indicated on your report sheet the ingredients for exactly 1,000 pounds of mix testing 9 per cent butterfat, 11 per cent serum solids and which has a total solids content of 32 per cent. I am also giving you some figures below in Table No. 1 which was calculated in a little more concise form:

Table 1.

Ingredients	Fat	Serum Solids	Total Solids
155 lbs. 28% cream	43.4	24.13	67.53
586 lbs. 4.5% milk	26.4	50.40	76.80
24 lbs. 84% butter	20.2	.....	20.20
38 lbs. skim powder	...	35.50	35.50
120 lbs. sugar	...	.....	114.00
7.5 lbs. gelatine	...	.....	7.12
5.0 lbs. vanilla	...	.....	.75
64.5 lbs. water	...	.....	.....
1,000 lbs.	90.0	110.30	321.90
Per cent	9.0	11.03	32.19

There does not seem to be anything wrong with the composition of your mix as far as butterfat and solids is concerned. If you are using a good fresh flavored butter, as well as a fresh soluble skim milk powder without a taste or odor, these products should not impart anything but a good flavor to your ice cream.

You stated that you were using an ice cream improver and some ice cream powder but you do not state what amounts were used. It is possible that you are using too much of this material for your mix and this is giving you the abnormal flavor. I suggest that you use possibly a little more gelatine and leave out one or both of these materials and see if you still get the "off" flavor. It is not necessary to cook the gelatine before adding it to the ice cream mix. We have for several years mixed the dry granulated gelatine with some sugar and introduced it into the mixture just before it has reached the pasteurizing temperature and we have obtained better results this way than by heating or cooking the gelatine. If handled in this pasteurizing vat it is sure not to be over-heated or overcooked.

I trust that you will soon be able to overcome this difficulty in your flavor with the suggestions given above but if you still have trouble kindly write again and give me absolutely all the materials used, stating the quality and flavor of the butter, powder, etc., and I am sure that I can locate the trouble for you.

* * *

Dear Sir:—Will you please analyze the following mix? 1270 lbs. water; 100 lbs. skim milk powder; 128

A 14 CARAT FIND FOR YOU

If you are a conservative, as well as a progressive ice cream manufacturer the following will interest you:—

Something entirely new—(never has been offered anyone) will be submitted to those who write for information.

Complete facts in the case will be mailed you (upon request) about September 15th.

An absolutely new way to put punch in your present advertising and selling plans—requiring no radical change on your part—no additional expenditures.

By placing your request **now** you may be the one to secure exclusive rights in your city. A decided advantage over competition will accrue to you.

Gamble with a 2c stamp today then be glad September 15th.

Ours is an entirely new organization consisting of some well known ice cream supply men.

Address Box "L" Ice Cream Review, Milwaukee, **at once.**

lbs. sweet butter; 540 lbs. 8 per cent plain condensed milk; 215 lbs. sugar; 11 lbs. gelatine; 5 lbs. flavor.

With above quantity of water includes the water used for dissolving gelatine. Batch makes 400 to 420 gallons ice cream.

Yours very truly, W. C. V.

Reply: I have analyzed your ice cream mix and you will find the calculations below in Table No. 1. I am quite sure that you must have made a mistake in writing down the number of pounds of water for your entire mix as you will note that the percent of fat is only a little better than 6 per cent and the total solids 25 per cent. The percentage of sugar is only about 9.5 per cent. You should use at least 12 per cent sugar for a good ice cream. The butterfat contents for your state should be at least 8 per cent and the total solids of the mix ought not to be less than 32 per cent.

Table No. 1 (Your Mix)

Ingredients	Fat	Serum Solids	Total Solids
1270 lbs. water	....	.....	.....
100 lbs. skimmilk powder.	....	95.00	95.00
128 lbs. sweet butter	107.5	.....	107.50
540 lbs. 8% plain cond.	43.2	97.20	140.40
215 lbs. sugar	....	.....	204.30
11 lbs. gelatine	....	.....	10.45
5 lbs. flavor	....	.....	.75
2269 lbs.	150.7	192.20	508.40
Per cents	6.64	8.44	24.6

Per cent sugar, 9.47.

I notice from what you say regarding the ice cream you are not getting enough over-run when compared with that obtained by other factories, however, if you are using the mix as analyzed above you are probably getting too much over-run for the amount of solids in the mix.

* * *

Dear Sir:—I have been making ice cream for several years and at present am employed in a small creamery in this city and I wish to give you their formula for mix, and wish you to criticise this mix as to balance and theoretical over-run. Mix is as follows: 53 gallons 4 per cent milk; 32 lbs. powdered milk (Gold Seal brand); 4½ gallons sweetened condensed milk; 83 lbs. sweet butter; 5 lbs. gelatine, dissolved in 2 gallons hot water; 70 lbs. sugar; 7 ounces salt.

We put the 53 gallons of milk in the mixing tank, cold, and then add the powdered milk and run 10 minutes then heat up to 120 degrees and then put in the sugar and when it gets up to 130 degrees we add the butter, and when melted we add the condensed milk and gelatine and salt, then run 10 minutes before we commence to cool down to 120 degrees then we run this mix through an injector and cool down to about 50 degrees on a cooler and run in to ten gallon cans and set in the cool room. Some times I have to use this mix the next day but try and age it two days before I make it up in the ice cream. This mix weighs nine pounds to the gallon. I use a creamery package horizontal brine freezer 40 quarts and my over-run runs from 80 to 85 per cent. Now what I wish to do is, be able to get 100 per cent over-run. This mix makes a very nice cream. Would you suggest increasing the speed of my freezer? It runs now 180 r. p. m., and if you think advisable to increase the speed please state at what speed per minute you would suggest. My temperature of brine on freezer runs between 8 and 10 degrees above zero.

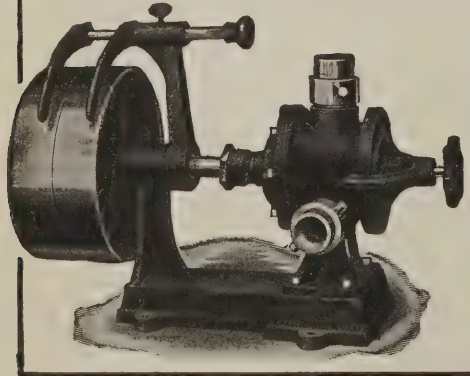
The next assistance I wish is to learn how to figure a mix out. I can figure the butterfat in cream and milk but do not know just how to get the solids, cream, skim milk, sugar and condensed milk and gelatine. Any information on this you can give me by figuring it out will be thankfully received. G. P. B.

Reply: You will find below in Table No. 1 a complete calculation showing the number of pounds and per cent of the butterfat serum solids and the total solids of your mix.

You should have no trouble in securing a very fine ice cream from this mix and you should also have no difficulty in getting an over-run of 100 per cent or better, providing your freezer is running satisfactorily. Every freezer has a certain rated speed at which it should run and I am hardly able to tell you whether you could secure better results by increasing the speed of this particular freezer.

Table No. 1 (Your Mix)

Ingredients	Fat	Serum Solids	Total Solids
53 gal. or			
455.8 lbs. 4% milk	18.23	38.95	57.18
32.0 lbs. skimmilk powder	....	30.40	30.40
4½ gal. or			
49.5 lbs. sweet condensed.	....	13.36	33.16
83.0 lbs. sweet butter	69.72	.....	69.72
5.0 lbs. gelatine	....	.....	4.75
17.5 lbs. water	....	.....	....
70.0 lbs. sugar	....	.....	66.50
.8 lbs. salt	....	.....	.70
713.6 lbs.	87.95	82.71	262.41
Per cent	12.3	11.5	36.7



Per cent sugar, 12.58.

In making the calculations given in Table No. 1 you have 53 gallons of milk which weighs 8.6 pounds a gallon, making a total of 455.8 pounds. This multiplied by 4 per cent gives 18.23 butterfat, then subtracting 18.23 from 455.8 makes 437.6 pounds of milk serium or skim milk. Multiplying this 437.6 pounds of milk serums by 8.9 per cent we get 38.95 pounds of serum solids. Adding the butterfats and serum solids gives 57.18 pounds of total solids. To get the solids in the skim milk powder the 32 pounds of powder is multiplied by 95 per cent which amounts to 30.4 pounds.

You will also have 4½ gallons of sweet condensed milk. This weighs 11 pounds to a gallon or a total of 49.5 pounds. Multiplying 49.5 pounds by 27, which is the per cent of milk solids in average sweet condensed milk, gives 13.36 pounds of serum solids; 49.5 times 40 per cent, which is the per cent of sugar in the contents, gives 19 8 poounds sugar. Adding the two gives you 33.16 pounds total solids.

Sweet butter usually tests 84 per cent butterfat. 83 times 84 per cent gives 69.72 pounds butterfat, in

Will "Tinkering" Lower Your Costs?

Is your ice cream plant the kind that is constantly being added to, rebuilt, repaired, remodeled and generally overhauled so often?

Do you wonder why there is such a waste of labor, power and material in your plant?

Do you find that production costs are increasing while production capacity falls off or remains stationary?

Willow Brook Dairy Co., Mt. Vernon, N. Y.

THIS is the situation in many ice cream plants today. And the answer frequently lies in the factory buildings and arrangements rather than in other factors commonly blamed.

If your plant is the kind that is constantly getting out of gear and needing adjustments—if it doesn't function efficiently, there's probably something fundamentally wrong with it and no amount of tinkering can help. There are many ice cream plants with high production costs which were not planned and constructed upon a flexible basis to take care of today's and tomorrow's growth and expansion. That's why low costs and high production are impossible.

The scores of progressive ice cream plant owners who have consulted and applied

McCormick Service

to their plants will tell you that the future demands of their plant and business were given the fullest consideration as well as the present needs. They will tell you, too, that production costs are remarkably low and production capacity exceedingly high.

If you are confronted with plant problems, no matter what their nature, our experience in the design and construction of ice cream plants should prove valuable to you. You do not obligate yourself in any way to consult us.

the 83 pounds of sweet butter. Gelatine contains 95 per cent solids so that 5 pounds times 95 per cent is equal to 4.75 pounds. The sugar is also figured at the rate of 95 per cent solids so that 70 pounds of sugar will amount to 66.5 per cent solids.

* * *

Dear Sir:—We are installing a 300 gallon mixer, and a viscolizer. Wish you would figure out a good mix for ice cream with 10 per cent butterfat, and about 34 or 35 total solids. Our cream tests 18 per cent butterfat, and use condensed skim milk, condensed 3 to 1. Also please give a mix using butter and milk.

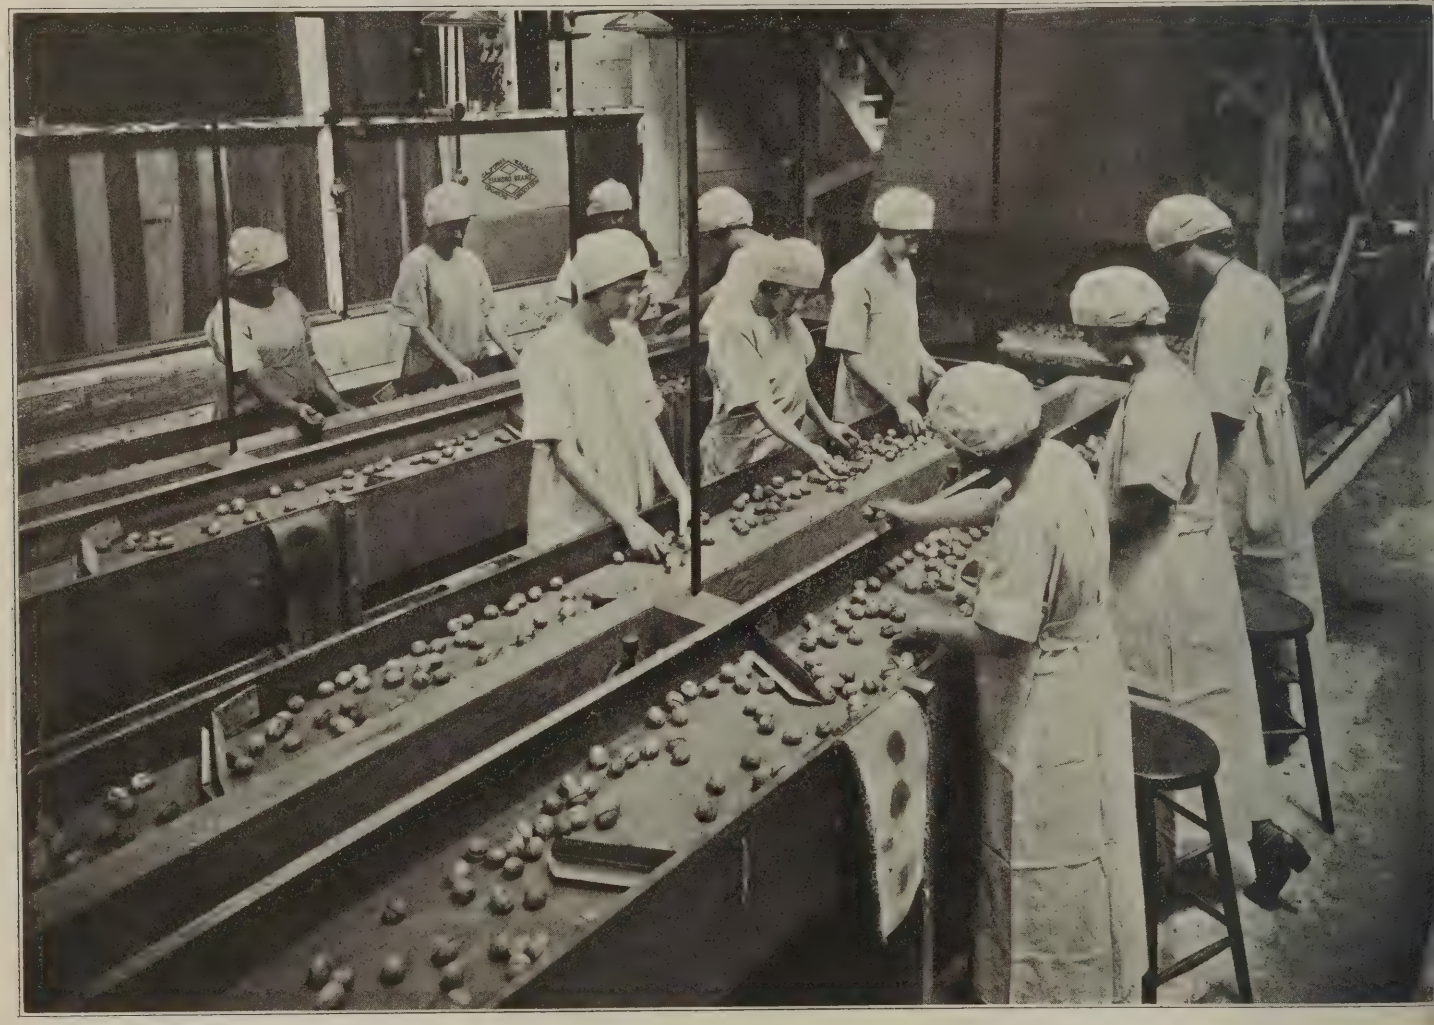
Yours truly, H. C. CO.

Reply: I am suggesting below in Tables 1 and 2 100 pound mixes which you will undoubtedly find satisfactory:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	....	.....	11.40
1.0 lb. filler and flavor	....	.....	.75
55.5 lbs. 18% cream	10.0	4.01	14.01
31.5 lbs. condensed 27%	....	8.50	8.50
100 lbs. mix	10.0	12.51	34.66

Table No. 2.



Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	....	.....	11.40
1.0 lbs. filler and vanilla	....	.....	.75
12.0 lbs. 84% butter	10.0	.....	10.00
30.0 lbs. cond. skim	....	8.10	8.10
45.0 lbs. skimmilk	....	4.01	4.01
100 lbs. mix	10.0	12.11	34.26

Each of these mixes will make approximately twenty gallons of ice cream weighing five pounds to the gallon.

Walnuts, Two Million Pounds A Year

SODA fountain specials may come and soda fountain specials may go, but the nut sundae goes on forever, growing more popular day by day, and becoming more palatable as fountain dispensers come to the conclusion that pure chopped California walnuts give patrons a satisfied sensation which can be obtained from no other kind of topping.

People like walnuts any way they are served. It hasn't been many years since walnuts were first used for topping sundaes, but in that time there has been a phenomenal increase in the consumption of California shelled walnuts. Five years ago, cracked walnuts were not offered to the trade in quantities large enough to be worthy of consideration. To-day the California Walnut Growers' Association is selling them at the rate of 2,000,000 pounds a year.

During the last twelve months the Association has sold 1,980,935 pounds of shelled walnuts, and it could have disposed of an additional 250,000 pounds had the stock been available. The demand for chopped and shelled walnuts has increased so rapidly that the associated growers in California have had to build great batteries of machines with which to crack the nuts. It takes 1,000 young women, working eight hours a day, nearly the year round to hand-sort the meats.

Shelled walnuts caught on with the catering trade from the very day of their introduction. Their whiteness and delicious flavor have made them a favorite with soda fountain patrons, ice cream makers, bakers and confectioners. Fig packers can use all the large halves they can get in embellishing their candied figs for the confectionery trade.

One of the most attractive features of California shelled and chopped walnuts is that they are packed in glass jars and tins by a vacuum process which absolutely assures their keeping qualities. For the soda dispenser, California chopped walnuts, chopped just right for topping nut sundaes, banana specials, etc., are available in three pound tins. It is an economical product, because it does not have to be kept in cold storage during the summer months. The dispenser is also relieved of the mess and waste attached to shelling and chopping the walnuts in his own factory.

California produces 50,000,000 pounds of walnuts a year. This is half of the world's production, and all of the walnuts grown in California are consumed in this country. The California Walnut Growers' Association prepares cracked and chopped walnuts for the trade by cracking the nuts in monster cracking machines, each of which can crack 20 tons of nuts per day and turn out 85 per cent of the halves unbroken. All of the halves are picked out of the shells and hand-sorted by uniformed young women, who work under ideal conditions in a new seven-story factory costing $250,000.

U. S. DEPARTMENT OF AGRICULTURE CONDENSED AND EVAPORATED MILK MARKET REPORT FOR JULY, 1921.

By Bureau of Markets and Crop Estimates.

Prices of Condensed and Evaporated Milk Lower but Movement Still Sluggish.

But little change in conditions is noted in condensed and evaporated milk markets. There have been spots when the tone of the market seemed to be temporarily stronger, and some individual firms, principally those producing bulk goods, reported demand better and stocks moving fairly well, but for the most part trade continued to be more or less sluggish. The bulk goods trade has profited through the summer demand from ice cream manufacturers whose business has shown the usual increase incident to extremely hot weather. Bulk goods manufacturers have for this reason shown more willingness than usual to let goods accumulate. Shrinkage in fresh milk production with a resulting curtailment in manufacture may have also been responsible for any better feeling which may have prevailed.

Total stocks in manufacturers' hands on July 1st show practically a 25 per cent increase over the June 1 stocks, but were 1 per cent less than July 1 a year ago. It should be noted that this accumulation follows close upon the season of flush production, which will account, to some extent, for an increase. It appears that unsold stocks were of more concern, for according to reports rendeered by manufacturers they were much heavier July 1 than June 1, and also July 1, 1920. Reports from the comparatively few firms which had unfilled orders indicated that these orders were practically all for evaporated case goods.

Prices paid producers during July averaged practically the same as during June. Slight increases which occurred in the Atlantic, northwestern and some of the middle Western states, were offset by correspondingly lower prices in other sections. Selling prices during June were reduced on all classes of goods, reductions being heaviest on case goods. Sweetened condensed in cases to domestic trade sold at 64c lower and unsweetened evaporated in cases at 39c lower than during the previous month. Reductions to foreign trade were 73c and 23c respectively.

Export business during June more than doubled that of May, and was slgihtly in excess of April business. Evaporated case goods constituted the bulk of the exports, and the heaviest shipments went to Germany. Total exports of condensed and evaporated combined during the first six months of 1921 were less than half of these during the first half of 1920, and it is of further interest to note that while in 1920 the bulk of the exports consisted of sweetened and condensed, the reverse has been true this year. Of the combined exports of the two classes of goods this year, January to June, inclusive, amounting to 131,322,504 pounds, Germany has received over 31,000,000 pounds, the United Kingdom over 20,000,000 pounds, Cuba some 18,900,000 pounds, and Poland close to 15,500,00 lbs.

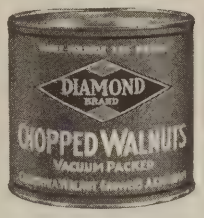
Chopped Diamond Walnuts

Ready to Serve on Sundaes

SAVE TIME—SAVE MONEY

Diamond Walnuts are selected nuts from 4,000 California groves. Special 3 lb. tins contain the choicest tid-bits of Chopped Diamond Walnut Meats packed in vacuum all ready to serve over sundaes and cake. Put up especially for confectioners and soda fountains.

They are the same high grade Walnut meats that are known and prepared in most homes throughout the country.



A bargain at the new prices.

Order from John R. Adams & Company or the California Walnut Growers' Association.

DIAMOND California WALNUTS

DIAMOND BRAND

"Crackin' Good Walnuts"

Here's the 3-lb. tin—six to a case packed in vacuum. They'll retain their freshness and delicious flavor indefinitely until the can is opened, and under ordinary conditions will not deteriorate for a month thereafter.

MAGNETIZE ICE CREAM

With a Mysterious, Alluring, Delightfully Tempting Flavor and Fruity Taste that will draw customers as a magnet draws steel.

"What is it?" "Isn't it fine!" Yes, these and similar exclamations you will invariably hear, yet so supremely delicious is it customers always insist on more.

That's the kind of flavor and fruity taste you'll get by adding to your ice cream.

Blanke-Baer Honey Fruit Salad

Think what it would mean to you to ask thousands of customers their first choice of fruit, and flavors, and then offer those same customers a combination of a dozen or more of those first choice fruits and flavors, made into a **Supremely Delicious Ice Cream.**

That's Honey Fruit Salad—that's the tempting flavor and fruity taste that'll win customers and hold them—that'll overcome selling difficulties and gladden your heart.

Put up in gallon cans, 10 gal. kegs, ½ bbls. and bbls.

Don't lose time or wait for sample. Order TODAY a case (6 gal. cans) of this heavenly mixture. You'll be surprised at wonderful results and low cost.

Blanke-Baer Extract & Preserving Co.
3230 South Kings Highway
ST. LOUIS, MO.

Butter and Ice Cream Manufacturers

706-709 Brown Street

Charlottesville, Va.,

NOTICE!

THIS is one of the many ice cream manufacturers who lets "the picture tell the story."

You, too, should let the picture convey the fact that you sell ice cream.

See the other side for details.

TEMPTING pictures will create more desire for your product than mere words or any arrangement of type!

The picture tells the story. It conveys your business to the reader at a glance. Its attractiveness commands attention and the thorough reading of your letter which you strive for. It creates desire for your product, and makes the reader "sit up and take notice".

You can have this idea incorporated into ***your*** letterhead,—printed in four colors with your firm name and wording along the line of this sample and on the same grade of stock at prices that will interest you.

Only one ice cream manufacturer in each city can secure the use of this distinctive design. You may need a supply before long. Here is your opportunity for something different.

Write for prices.

MILWAUKEE, WIS.

ASSOCIATION OF ICE CREAM MANUFACTURERS OF IOWA.

The time for the Twenty-first Annual Convention of the National Association of Ice Cream Manufacturers, which is to be held in conjunction with the National Dairy Show, is rapidly approaching and it behooves us as manufacturers to begin laying our plans to attend.

This great Show is to be held at a very advantageous location and season for us Iowa manufacturers, and I wish to urge the entire membership of the Iowa Association to be there. At the time set for this meeting you will be well over the crest of this year's strenuous activities and will need a relaxation, rest and vacation. In what better, more pleasant, beneficial and delightful manner can you spend it than by taking a week, beginning October 10th, drive to the Twin Cities, take in both these great meetings and see these two beautiful cities of the North, with their wonderful parks, lakes and boulevards. By the combination of these two shows you are afforded several unusual opportunities.

First—A vacation period at just the time most needed, immediately following a heavy season's run and just before settling down for the winter's struggle, trying to make expenses until another season opens.

Second—To see a combination exhibit of the most complete line of dairy machinery and equipment probably ever displayed.

Third—To be privileged to mingle with, examine and feast your eyes upon a gathering of the world's best and most famous dairy cattle.

Fourth—To have the privilege and opportunity to attend lectures by the greatest authorities on dairying and ice cream making.

Fifth—And by no means the least—the privilege of meeting your friends, competitors and fellow manufacturers, exchanging with them experiences, congratulations or condolences, as the case may require. If your competitor is more successful than you, find out how he does it, if he be less successful, tell him how you do it, and by this exchange of ideas help to make this great industry bigger, broader and more successful.

This to us Ice Cream Manufacturers of Iowa is a wonderful opportunity that none can afford to miss, so let's be there one hundred percent strong, ready to do our part to make the meetings successful, to help others enjoy them and to derive all the benefits from them possible ourselves, for as we help others, so shall we ourselves be helped. Tell your friends and neighbors that you and your wife are going to the "WORLD'S GREATEST DAIRY SHOW—MINNESOTA STATE FAIR GROUNDS, October 8th to 15th," and then see that you keep your word.

W. S. WILCOX, President
Association of Ice Cream Manufacturers of Iowa.

CHERRY CHANGES CHICAGO OFFICE.

It has been found necessary for the J. G. Cherry Company whose headquarters are at Cedar Rapids, Ia., to change the location of their Chicago office from 105 W. Monroe St. to Room 500 in the Northwestern Bldg., at 208 N. Wells St. This is also the location of the office of the National Poultry, Butter and Egg Association. The telephone number of the new location is Franklin 3473, and the office, as was the old one, is in the charge of J. B. Addison, better known to the trade as "Judge."

B-K Bacili-Kil

Solves Hot Weather Problems

Patrons' cans become very foul in hot weather. A B-K rinse gives instant sterilization and keeps bacteria out of milk or cream which comes to your plant.

Your equipment breeds bacteria rapidly these hot days, despite scrupulous care unless effectively sterilized. A little B-K in the rinse water destroys them without extra labor, and at the insignificant cost of ½ cent to a cent per gallon of dilution.

B-K is economical—quick—and handy. Thousands of dairymen and manufacturers of dairy products are getting the benefit of it these days and it will help you as well as the others.

At All Dairy Supply Houses.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

Tariff Increase not Reflected in Price

Readers of "Facts About Sugar" and especially those who have followed the illuminating articles on the tariff contributed to our columns by Judge Sidney Ballou, know that an increase in the import duty on sugar is not unvaringly added to the price. Conditions of supply and demand determine whether or not the duty affects the price.

No more striking illustration of this truth could be given than has been afforded by the course of the market following the enactment of the emergency tariff which went into effect on May 28. The closing price of 96 degree test centrifugal sugar, duty paid, in New York on the preceding day was 5.06 cents a pound. On the reopening of the market, May 31, following the signing of the bill, the first sale was made at exactly the same price. The market entirely disregarded the fact that between these two transactions the duty on 96 degree Cuban sugar, which is the effective rate, had increased six-tenths of a cent a pound.

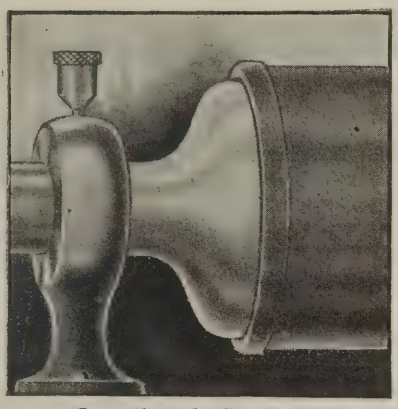
Not only did the market fail to reflect this change in tariff, but in subsequent sales during the same week the price of raw sugar declined to 4.63 cents a pound and this downward movement has since continued and has been accompanied by a lowering of the price of refined from 6.60 to 6.25 cents a pound.

The controlling factor determining prices during [illegible] to demand. The particular influence that led to the market decline during the past fortnight was the realization that the Cuban sugar crop was going to be much larger than had been anticipated. Earlier reports from Cuba, almost without exception, had led to the belief that the crop would be no more than 3,250,000 long tons, if indeed it attained that figure. With final reports from fully half the centrals at hand, however, it became evident that Cuba's outturn for the season now closing would probably equal or possibly exceed that of last year. The addition of half a million tons to available stocks of a market already well supplied could hardly fail to depress prices.

Since Cuba occupies a marginal position in the United States market, supplying that part of its requirements which domestic production cannot satisfy, and since Cuba has on hand more sugar than this market can absorb and possesses no other ready outlet for it, the inevitable result of increasing the cost of landing Cuban sugar in New York was that this cost had to be absorbed by the Cuban producer. In this respect the import duty was in the same category as an increase in ocean freights or any other item in the marketing of the Cuban output.

The price fixed for any world commodity, such as sugar, by the controlling market represents that market's judgment of the price at which demand will absorb the immediately available supply. It fluctuates from day to day with every change in the information available to the market as to the probable extent of supply or of demand. The producer who is unable or unwilling to meet that price must remain out of the market. This in fact, is what has happened in the case of the Cuban Sugar Finance Commission. Its view as to the price that should be commanded by Cuban sugar being at variance with prevailing market opinion, the Commission has remained out of the market and the unusual spectacle has been presented of no Cuban sales, except from store, over a period of two weeks.

It has been pointed out repeatedly that while the increase of the tariff unfavorably affects the position of Cuban sugar as compared with the domestic product, it adds to the protection enjoyed by Cuba in the United States market, as compared with the rest of the world. As the rate on full duty paying sugar of 96 degree test is two cents a pound, and as Cuba under the reciprocity treaty enjoys a preferential of 20 per cent, the advantage of the Cuban in this market as compared with other foreign producers has been increased from 25 to 40 cents a hundred pounds.



This argument would apply if supplies available from the domestic industry and from Cuba were inadequate to meet the requirements of the United States. In such case the Cuban would be able to take advantage according to circumstances of all or part of his preferential. Under present circumstances, however, all imported sugars, whether of Cuban or other origin, must pay the duty as part of the expense of reaching this market.

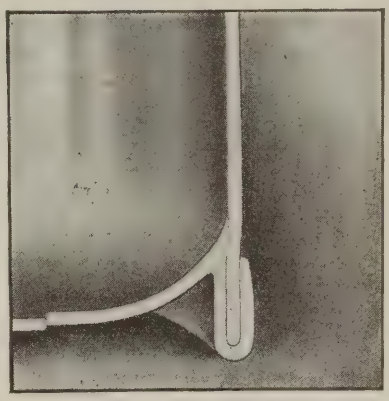
As a matter of fact one peculiar condition has operated temporarily to give full duty paying sugars a slight relative advantage over those coming from Cuba. Under the drawback clause of the tariff law the refiner

Electric Weld

Trade Mark Registered

RIVETLESS—SOLDERLESS ICE CREAM CANS

Inserting the Bottom.



This bottom is inserted by 6,000 lbs. hydraulic pressure, the outside flange being forced against the cylinder.

The Retinning Feature

Electric Weld Ice Cream Cans may be retinned over and over again at small cost. They are made complete in the black, leak-proof and ready for long service. Every time you retin an Electric Weld you can save approximately 30 cents. Write for prices, list of "Repeat order buyers" and other data pertaining to the **Solderless Can.**

The Best Bottom Made

The illustration above shows the method of inserting the bottom into the cylinder by means of a hydraulic ram, the head of which exerts a pressure of 2200 lbs. on the bottom, giving it a much more severe test than would occur in actual use. The average ice cream can bottom is inserted by hand with the aid of a light tinsmith hammer.

Water Tight, Non-Leak Bottom.

This bottom construction absolutely eliminates leaks and at the same time presents a smooth, round edge for gripping with the hand and of a thickness sufficient to withstand rough usage.

who imports raw sugar and exports it after refining is allowed to recover 99 per cent of the amount originally paid at the custom house. While the proportion recoverable is the same in the case of Cuban and full duty paying sugars, the actual amount returned is of course greater in the case of the latter since they pay a higher duty on admission.

Under these conditions refiners who have export orders on their books naturally find an advantage in using full duty paying sugars in filling such orders. This has led to the purchase of full duty paying sugars in limited quantities at a figure slightly above Cuban parity, but this situation can be expected to continue only while there is an export demand for refined.

—Facts About Sugar.

WORKING FOR A FIVE CENT CONE.

The American Cone & Pretzel Company, Philadelphia, has been waging an energetic campaign to induce retailers to sell ice cream cones for a nickel. We quote from one of their circulars as follows:

Why Ice Cream Cones Should be Sold for 5c, Retail —Six years ago cones were made to fit a sixteen to the quart dipper. With the increased cost of ice cream the cone manufacturer made a cone fit a twenty-four to the quart dipper.

The five-cent chocolate bar and the five-cent package sweet have come back and we suggest to the trade to reinstate the five-cent cone.

With bulk ice cream at $1.20 per gallon (it is $1.12 in some cities) the profit figures as follows:

Cost: Figuring 80 measures from a gallon of ice cream, $1.20; 80 cones, 40c; tax on 80 cones, 80c. Total, $2.40. Selling Price: 80 cones, at 5c, $4.00. Profit, $1.60

You can also sell two cones for ten cents and pay only one cent tax on the sale.

An observer was placed one day in a small corner confectionery store in a Western city. One hundred and twenty-six intending purchasers came in the store —seventy-two asked for articles costing ten cents or less. Of these seventy-two calls fifty-two asked for an ice cream cone. When they were informed of the six-cent price, thirty-eight out of the fifty-two changed their order to something that cost a nickel or went out buying nothing. Fourteen paid the six cents. Only fourteen out of fifty-two. THINK IT OVER.

Don't miss a single copy of The Ice Cream Review. We'll see that you do not if you send us two dollars for a year's subscription.

SELLING ICE CREAM BY WEIGHT.

It has come to my attention that several retail dealers in California are selling ice cream to the public by weight. I have communicated individually with the manufacturers supplying each of these customers so that they might personally correct this abuse.

There can possibly be no legislation requiring ice cream to be sold by weight for two years; however, this question has renewed itself on the part of the present State Superintendent of Weights and Measures whereby he is encouraging the further investigation by each County Sealer of Weights and Measures.

The office of our association will be particularly pleased to receive any specific information regarding propoganda above referred to.

THE CALIFORNIA AND SOUTHWESTERN STATES ICE CREAM MFG. ASSO.

By Robert J. Dryden,

Chairman Standards and Legislative Committee.

BOSTON BOYS DEMAND CHEAPER ICE CREAM.

Boston, Mass.—The boys of Boston have always resented anything that interfered with their seasonal enjoyment. In 1775 they braved the wrath of the British Gen. Gage to make protest against military encroachment on their coasting places on Boston Common. Today they marched again, in protest against prices that have curtailed their enjoyment of ice cream.

As in revolutionary times they went to Beacon Hill with their protest, but today it was to a smiling and perspiring representative of the Governor that they presented their petition. On the way to the State House they stopped at the City Hall to make a similar request to Mayor Peters.

Governor and Mayor were asked to bring down the price of ice cream cones. "Our fathers cannot buy them for us at the present prices," the children's petition said. "Please make the ice cream dealers do right."

In the demonstrations girls joined with their brothers.

OPENS NEW ICE CREAM COMPANY.

Mr. John Hollinger, formerly of Joplin, Mo., has opened up the Polar Ice Cream Co., 3724 Easton Ave., St. Louis, Mo. We appreciate the fact that Mr. Hollinger believes in starting out with the right literature on hand—he has already subscribed for THE ICE CREAM REVIEW.

Scientific Boiler Feed Water Regulation, Can It Be Attained in Practice

By ROLAND MOELLER, M. E.

THE first efforts in boiler feed regulation aimed at keeping the water level in the boiler as nearly constant as possible. Later, in about 1912, it was realized that keeping the water level constant at all times had decided disadvantages.

Prior to that time, automatic boiler feed regulation depended on a combination of floats, pilot valves, diaphragms, springs, etc., which would give the feed water valve a full opening until a certain maximum water level had been reached in the boiler, and then would close off the feed water valve entirely, until a certain lowest limit in the water level had again been reached. This gave an irregular intermittent feed, which insofar as its effect on the generation of steam was concerned, was not much of an improvement over hand regulation.

While an automatic mechanical device that is absolutely reliable has never been made, there are many automatic mechanical devices which are far more reliable than a human being, especially where the apparatus is given a reasonable amount of care and attention. It is for this reason that a water regulator, properly designed, will add much to the safety of operating a plant.

The more intelligent help in the plant is relieved of a great deal of the strain and worry of watching the flow of feed water and its regulation, and the morale of the boiler-room is increased to the extent that more interest is taken in other matters of vital importance having to do with the economy of the plant.

A continuous flow of feed water with gradual variations in rate saves the boilers, heaters, economizers, meters, water pumps, piping, and all connection from shocks and strains due to violent and extreme fluctuations in the rate of feed water flow peculiar to many forms of old style regulators.

The continuous flow also makes possible the use of smaller feed pumps, feed water pipe lines, connections, valves, etc., because when the feed water supply is continuous, the rate of flow at any given time need not be as great as when water is fed intermittently.

As the equipment in boiler rooms became more and more involved with the addition of water softeners, economizers, feed water heaters, superheaters, temperature, steam and water meters and recorders, and other apparatus to promote economy and efficiency in the generation of steam, it became evident that the rate of flow in the feed water had a decided effect on the efficiency of all of this equipment and on the legibility of the charts produced by the various recording meters.

A water softener is calculated to handle a certain number of gallons of water per hour on the basis of a continuous even flow. Where the flow is intermittent

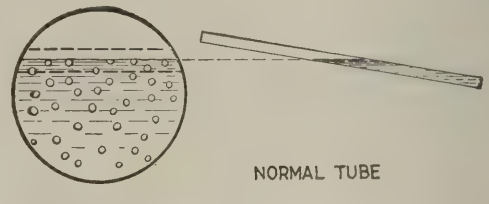

FIG. 1

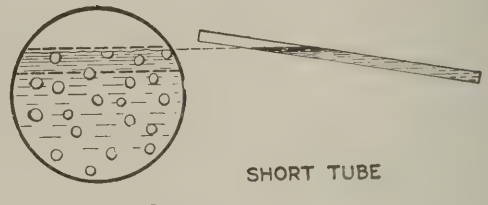

FIG. 2

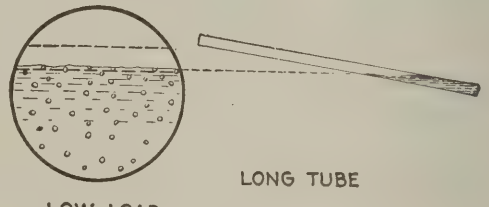

FIG. 3

and irregular, a much larger water softener must be installed to handle the same quantity of water, and its operation is far less satisfactory and economical than it would be if the flow of feed water were continuous and more closely in unison with the rate of steam output of the boiler.

The same is true of economizers and feed water heaters. When the flow of feed water through these

is reduced, the feed water reaches an excessively high temperature and may even turn into steam, resulting in water hammer and other troubles in the feed water system. The apparatus under these conditions allows heat to escape without being absorbed. On the other hand, when at intervals the feed water valve is opened wide, the feed water rushes through at such a high rate that it is not warmed up to a temperature commensurate with economical boiler operation.

The rate of feed water flow has a decided effect upon the steaming capacity of a boiler itself. A full opening of the feed water valve may pass enough cold feed water into the boiler to absorb all the heat generated by its furnace without generating any steam whatsoever. Intermediate rates of feed water flow will, of course, reduce the steaming capacity of a boiler in proportion to the flow of the feed water.

Bearing this in mind, it is evident that there are frequent periods in the operation of a steam boiler when it would be desirable to reduce the rate of feed flow so as to make possible the maximum generation of steam. This is particularly true after a period of low load when a sudden peak load comes on. Under these conditions the furnace must be given time to catch up with the new peak load conditions, and if, during this time, the rate of feed water flow is temporarily reduced, the boiler has a far better chance to meet the sudden increased demand for steam, when little heat is being consumed in heating up feed water to the boiling point in the boiler.

On the other hand, should the load suddenly drop off after a high load period, it takes some time for the furnace to slow down to where it generates heat at a rate in harmony with new load conditions. It is then desirable to increase the rate of feed water flow temporarily so as to absorb the extra heat generated by the furnace during this brief period.

Again, where a large number of boilers are acting in unison, fewer boilers can be made to do the same work which would ordinarily require a larger number of boilers laboring without scientific feed water regulation. With unscientific feed water regulation, the steam output of some of the boilers may be so affected by the admission of feed water during a high load crisis, that their addition to the total steam supply is very much curtailed or even reduced to zero when it is most needed. With scientific regulation on the other hand, all the boilers would be delivering their maximum output, the rate of feed water flow being reduced to a minimum in all of them at the same time to make this possible.

A good automatic feed water regulator should, then, feed continuously as long as there is a load on the boiler. It should temporarily reduce the rate of

feed water flow when there is a sudden increase in load and temporarily increase the rate of feed water flow when there is a sudden decrease in load. It should keep the water level high under low loads and low under high loads. During steady loads, it should maintain a constant water level by maintaining a constant rate of feed proportionate to the load. During gradual changes in the load, it should gradually adjust the rate of feed in proportion to the changes in the boiler load.

A regulator functioning on these principles acts as a sort of compensating boiler governor, that is, it supplies the means of absorbing the excess heat generated by the furnace during the brief period following a sudden falling off of the load when the furnace has not yet had time to adjust itself to the new conditions. It prevents the absorption of heat by the feed water when the furnace has not yet had time to catch up with a sudden increase in load, and all the heat that is generated is required for steam making. It utilizes the volume represented by the difference in the levels of the water between the the high and low water marks in the boiler as a sort of heat reservoir, and so regulates the water level as to insure dry steam at all times. It guards against damage due to too high or too low water level at any time.

It has been conclusively demonstrated that the water level of a steaming boiler undergoes pronounced fluctuations which have a direct relation to the rate at which it is producing steam. This is due to the increased volume of steam bubbles in the water when the steam output of the boiler is high. Illustrations Figs. 1, 2 and 3 show the variations in the water level in a steam boiler containing the same weight of water under normal, peak and low load conditions. This variation of water level according to load is one of the characteristics of steam boilers utilized in the type of regulator shown in figure 4.

A regulator of this construction is extremely simple, consisting merely of a straight tube, a lever, a heavy iron base, and a rugged balanced, practically frictionless valve. Such a regulator is easily adjusted to maintain the water level between any desired limits. The connections to the boiler as shown in Fig. 5, are of the simplest, so that any help ordinarily found in the boiler room can install it.

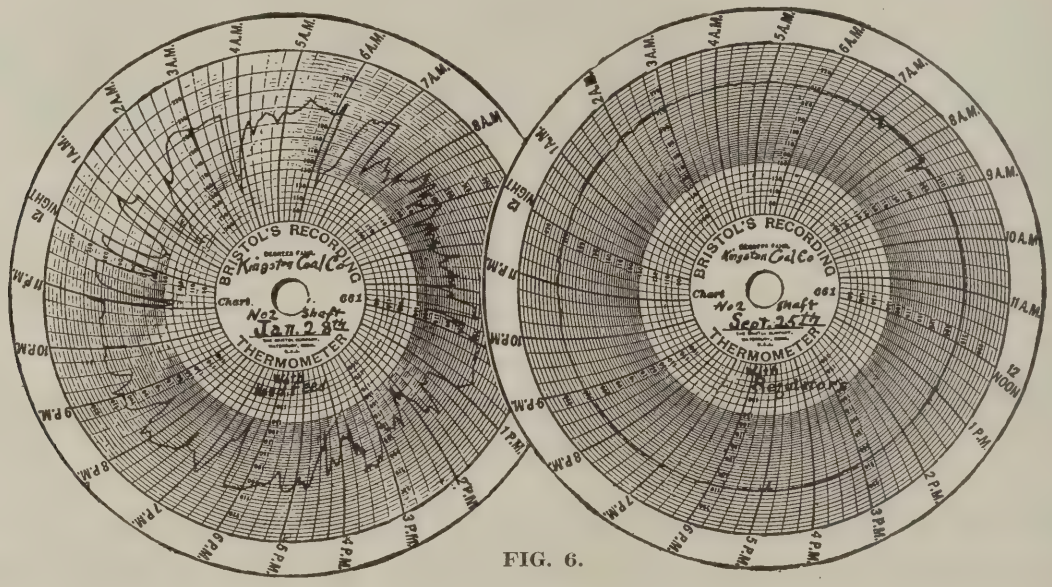

FIG. 6.

In this feed water regulator a metal tube having a large co-efficient of expansion is connected to the boiler in such a way that the level of the water in this tube varies with the level of the water in the boiler. The water in the lower end of the tube, not being exposed to any source of heat, becomes comparatively cool, while the upper end of the tube above the water level is kept hot by steam from the boiler to which it is connected. As steam slowly condenses in the upper part of the tube, it is returned to the boiler through

the lower end. If the water level in the boiler suddenly rises due to an increase in load, as in figure 2, the level of the water in the tube also rises and the length of the tube above water containing hot steam is reduced. If, on the other hand, there is a dropping off of the water level due to a decrease in load, as in Fig. 3, the length of the tube exposed to hot steam is increased by the amount the water level recedes in the tube. The portion of the tube which is exposed to the hot steam expands, and the greater the length that is so exposed, the greater the increase in the over-all length of the tube. This difference in the over-all length of the tube between high or low water is utilized to operate a valve which controls the rate of flow of the feed water.

When there is a sudden increase in the demand for steam, the water level in the boiler rises. The length of the tube exposed to the hot steam is decreased and the length exposed to the cooler water is increased. Consequently there is a contraction, and the over-all length of the tube is decreased and this in turn reduces the opening of the feed water valve. If the high load continues, the level of the water will, of course, gradually drop off until the water level in the tube comes to a point where the feed water valve again begins to open. The opening increases gradually until a uniform rate of feed is reached, which is equivalent to the rate at which the water is used up in making steam. If the demand for steam is high, the demand for feed water is high, and the feed water valve must have a wide opening. To get this, the tube must expand more. This in turn can only be brought about by a lower water level, and that is exactly what is desired under high load conditions.

If, on the other hand, the demand for steam suddenly drops off after a continuous high load, the water level in the boiler falls immediately, and with it the exposed to hot live steam is increased, causing an increase in its over-all length. This in turn opens the feed water valve so as to admit water to the boiler at a greatly increased rate until not only the former level is reached, but until the level is higher than the one under high load conditions. To reduce the flow of feed water to conform to the reduced demand for steam, the opening of the feed water valve must be reduced to less than it was when the demand for steam level of the water in the tube. The length of the tube was high, and to accomplish this, the thermostatic tube must contract more. It does this only with a rise in the water level. Higher water level during low loads is very desirable for heat storage purposes, as explained before, and is entirely permissible with light loads.

The two time-temperature charts shown in Fig. 6 are typical before and after records where one of these automatic thermostatic boiler feed regulators replaced hand regulation. The left hand diagram shows an average feed water temperature of 178°, which was the best obtainable with hand regulation. The right hand diagram shows an average feed water temperature of 210°, which resulted with automatic continuous flow regulation based on the principle here set forth. The average feed water temperature was therefore increased 32° F., which is equivalent to a saving of 3 per cent in fuel.

⚜

A SUGGESTION.

An easy way to discover gas leaks about carbonic acid gas drums and regulators as suggested by the Maas Carbonator Company of Milwaukee, is to prepare a thick solution of warm water and common soap, and apply it to all connections and joints in the gas line with a cheap shaving brush or similar common bristle brush. The leak will instantly be shown by a large bubble that keeps forming. This little idea has saved numerous dispensers money and trouble when used.

⚜

WESTERN ICE CREAM MAN IS DEAD.

San Francisco, Calif.—Charles G. McCarthy, manager of the National Ice Cream Company of this city, died suddenly at Mount Zion Hospital, following an operation for acute appendicitis.

McCarthy was 30 years old. He was prominent in the Native Sons, and for a number of years was a member of San Francisco parlor of that lodge. He was popular in business circles.

Mr. McCarthy leaves his mother, Mrs. Maria F. McCarthy; two brothers, John F. and Edward F. McCarthy, and two sisters, Mrs. W. L. Hickey and Sister Perpetua of the Holy Family Convent. He was the son of the late Florence McCarthy.

"Doc" Answers Another Question—

Dear Doc:

Since hot weather started some of my equipment, particularly rotary bottle fillers, have developed disagreeable odors. What can I do to remove them?

HARRY WAGNER, *Minnesota.*

Dear Friend:

As you no doubt are aware, bacteria multiply like mad during hot weather. As a result, milk and cream spoil easily and odors develop unless the equipment and receptacles are sterilized every day. Each day after you have finished the work and cleaned up, make a solution of Germ-X, using proportions of one ounce of Germ-X to one gallon of water, and run it through the entire system just as the milk or cream is carried. The vats, fillers and cappers, churns, separators, piping, pumps, etc., will be as clean and sweet smelling as a surgeon's instrument.

Write for free sample bottle of Germ-X and directions for using.

THE MELLEN'S FOOD BABY.

The Mellen's Food Baby of the Ottawa Condensing Company, of Ottawa, Kansas, had his picture taken a few days ago in his office, hoping thereby to convince his friends he really worked. Who ever knew Henry Bennett to work, except when he was called on to make a speech?

Earl Ward and Hugh Harrington suggest that he mail a picture to all his hoodlum friends.

* * *

After explaining to the editor that it is not at all like him to be remiss in matters of correspondence, Sam W. Smith, with the Western Rock Salt Co., 514 New York Life Building, Kansas City, Mo., has the following to say: "I want to apologize for neglecting for such an unreasonable time replying to communications from a publication whose mission is to distribute information, to improve the quality of ice cream and the upbuilding of an industry whose product goes into most of our homes and is eaten by a large majority of the hundred million people in this country. Good ice cream pleases and nourishes. The ice cream business in general has more than held its own with any other line of business. I travel, as you know, in Oklahoma, Texas, and part of New Mexico, and call on the ice cream trade. In these states there have been built some new and most modern plants, while many others have been enlarged and improved upon during the year to take care of the enormous demand for their product.

The ice cream people are in the saddle and when this period of depression ends, which it will do soon, it will move out and on in the procession of business progress. As for the Wolf Hounds, they can always be relied upon to deliver the goods in one way or another. That your business is good and you are all in good health is the wish of the writer.

* * *

It was on July 14th that an inspiration hit L. C. Hanks, Creamery Package representative, between the eyes and he sat down and wrote a brief message for this column. At the time he perpetrated the deed he was parked at the Hotel Amarillo, in the Texas city of that name. He reports that it was very hot when he landed there with bag and baggage and then goes on to say: "If the kind of weather they have down here wont make them eat frozen products, then it simply can't be done, that's all. I was afraid to let them know around here that I am a Wolf Hound, because the sheriffs of the state were holding a convention here and held a wolf hunting party. It was a good thing that C. R. didn't show up this afternoon or we would have been rounded up and the jig would have been off." When Hanks isn't working, which is seldom, he makes his headquarters at 1315 W. Fifth St., Oklahoma City, Oklahoma.

Is your package easy to remember?

"Putting the name across" is never an easy job. People do not make it a point to remember your name when they see it. But if the package is so designed that it will arrest their attention, if it is striking—"different"—they will begin to remember it after seeing it the second or third time. And they will associate your name with your product.

Then, too, your package must deliver its contents in good condition. And only a house that has learned, through long experience how to build the best boxes can do both jobs well.

We have designed and made boxes for exacting organizations in every branch of business. For more than 20 years we have been improving the packing methods of business houses thruout the country.

Our service department will be glad to send samples and quote prices.

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

CALIFORNIA ICE CREAM MANUFACTURERS' ASSOCIATION.

(Continued from Page 64)

My first point will be the discussion over the entertainment carried on by the supply men last night. I was going to compare that with the entertainment pulled at the Sunset Inn at Tijuana. But the Sunset Inn at Tijuana is backed off the map as regards such things as entertainment, so I will have to pass on to the next point. And that point is advertising.

We have done a good deal of advertising in the last sixty days, and I think I will tell you what the results have been. Our business has been going for seven or eight years, as some of you know I was in the creamery business for seven or eight years, but up to the first of November it was in the hands of a gentleman who had some stock, as manager, and when we took it over we went to work on entirely different lines to spend considerable money advertising, and in the last sixty days we have had a chance to see what the direct results were from the advertising, and if you don't mind, I will give you a line as to how we went at it.

We standardized on one thing: "Eat Sanitary Ice Cream, a Real Food." We have got twenty-eight tubs out in the country, twenty feet high and ten feet across, on the different roads, and you begin to run into them when you get to Oceanside, and when we got into town, we standardized the advertising at the customer's place of business all we could, and we have a window of stained glass that we put on if we can, and we have signs put on over their doors. But I want to say this, that if you are in the congested part of town, or down town, where people are walking, and are trying to stop them to get them to look at it, there is all the difference in the world if you put your sign down low. A sign over a door does not do so much good—they don't see it. But a sign in the windows or in an alcove, we standardize in that on the same thing, indicating that they should eat sanitary articles, and we put the word "Food" on, and I think we are getting through with that. Those customers for whom we have done that, have shown an immediate increase in sales. You can just see their account start right up, a week from the time the sign was put up. They are just ahead of the game.

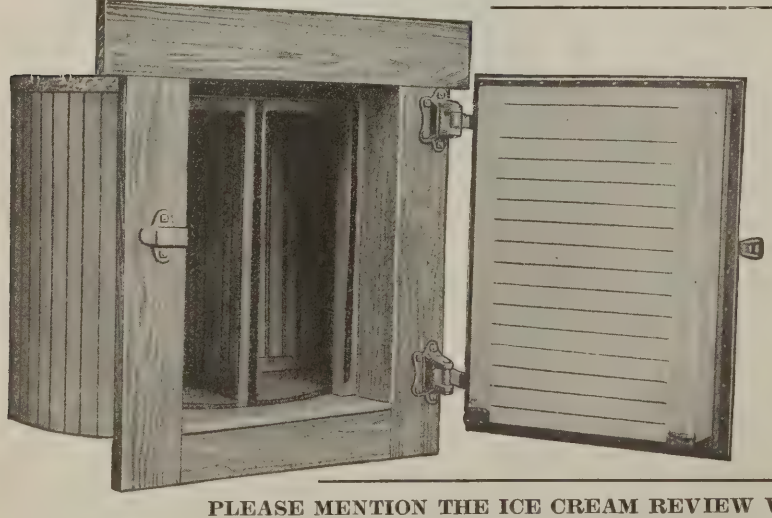
When it comes to price accounting, I think it is a good idea, if you can follow this up for a time, to run a price accounting on individual customers—say for a week at a time. If you keep close tab on the customer, as to how much time and ice and so on you put in, why, you will find, as we have, that there are customers who run the expense up to as high as fifty cents a gallon from the time the cream leaves the platform. That would be an extreme case, of course. We have had one or two that way. We have always had an icing charge, and that holds that down. I didn't quite finish my discussion of that the other day. But where we spring an icing bill on them of thirty cents a gallon, they will only pay such a bill once, and you will find that they will cut their number of holes down, perhaps, from four to two, and that saves a whole lot of trouble with the customers.

I think we can't keep too close a tab on the matter of cost accounting, right down to the individual customer, if we want to make money in the ice cream business, and I think, as I have stated two or three times before in this convention, we have not yet had any big decline in our expense, aside from the cream and sugar, and I don't know of any chance for any big decrease anywhere else in the near future, and we will have to remember that when we come to cut that price.

The President: This is an open subject, gentlemen—the good of the industry. That means that everybody is expected to participate in a short discussion of that broad and general topic. Now go to it—let us have a few short statements.

Mr. Hosking: Is this an appropriate time to make a motion, Mr. Chairman?

The President: Yes.



Mr. Hosking: I move that our Secretary be instructed to write a letter of thanks to the supply men who entertained us last night. We have thanked them individually, but I think we should do so officially.

Mr. Platt: I second the motion.

The President: You have heard the motion, which is that our Secretary be instructed to write a letter of thanks to the supply men who entertained us last evening. Are you ready for the question? Those in favor of the motion will say aye. Opposed, no. The motion prevails.

What further can be said under the head of "The Good of the Industry"? I know it is pretty good as it is, but let's make it better.

Mr. Goode: ..On the question of iceing-up charges, and cost of icing, and the question of how much a man should buy before he is entitled to free icing, etc., I want to tell you one thing I tried, and that worked very nicely. Beginning on the first of October, we found lots of customers that were buying a small amount of ice cream, and it was costing us more for the service than we were getting. So we put on a flat icing charge of a dollar a week to everyone, the man who had the small amount of ice cream as well as the man who had the large amount, and we found that the man getting the small amount could not afford to

pay for the ice, and consequently he quit. The man who was getting the larger amount of sales profited by the man quitting, and he didn't mind paying the dollar a week. So we cleared that matter up very easily. While the money we did get from the sale of ice amounted to nothing, it enabled us to take off a service here and another service there, so reducing the price on our service very materially. That saved pro rata on the gallon more than the icing charge. It didn't bring us in any money, but it stopped lots of small men from selling, who otherwise would have insisted on selling. In any case where a man was taking four or five gallons of ice cream a day, it was no trouble to supply him. But with the man selling one or two gallons a day, that man was not an asset at that time of the year. He had barely enough business to pay the dollar a week. And of course, considering the price, we naturally had to figure the price of the ice cream from the season as to what it cost to make the service, and make the business. So it seemed very satisfactory, and we had really no trouble, and it was a material saving in the small business, on the service end of the business. The amount of business that we really lost by the additional price meant nothing to us, because in comparison, it saved such a great amount on the service.

The President: Gentlemen, I think this would be an appropriate time, under this topic, "The Good of the Industry," to extend an invitation to Professor Lea, of the Food Department of the State of California, who is with us. We would be very glad to hear a word from you, Professor Lea.

Address By Prof. E. J. Lea.

Of the Food Department of the State of California.

Prof. Lea: Ladies and Gentlemen: I have nothing prepared for you today. But it occurred to me that you might be interested in knowing a little of the results of the inspection work during the past year.

Our troubles have not been very many. I think very few of you here have had any trouble at all with the Food Department. However, there are some few matters that might profitably be called to your attention.

The matter of butterfat in ice cream has been exceedingly satisfactory, that is, the percentage of butterfat. I recall of only a very few cases where the percentage has been sufficiently low to warrant action. We have in some cases found certain manufacturers a little deficient, and, on re-sampling, they might go just a little bit over. Therefore the matter would be dismissed and no action taken on the first sampling. Some of the smaller manufacturers, in a few of the country establishments making ice cream on a small scale, have been found materially deficient in the butterfat content of their cream. But those companies are comparatively rare. So it would appear that you have that point properly covered.

There is one matter to which I would like to call your attention today, and that is, the use in certain places of old or renovated butter, homogenized with skim milk and some other various mixtures, into the manufacture of so-called ice cream. That practice is not legal. The only way that butter can be used, any kind of butter, even if you could, in ice cream, is to label the product as homogenized ice cream. The principal feature of that, of course, is the quality of the butter used. A renovated butter should in no case be used for that purpose, or butter which is rancid or of bad quality.

The other points we have noted in the inspection work relate principally to artificial color and artificial flavor in ice cream. The use of a small amount of fruit with artificial flavor in color in a product sold as strawberry or raspberry, or as any other fruit flavor, of ice cream is not legitimate, unless the product is labeled to indicate those facts, and unless the product is sold in a way that the consumer knows he is getting an imitation product.

Quite a good many are perhaps violating the law in that respect at times. And, owing to the activity of our Department in other lines of foods, we have not investigated as completely as we might in this direction. But I would much rather call it to your attention now than to have to take up samples officially and cause any trouble whatever. In fact, that is the way we like to work on the food problems, when it can be done, by co-operation rather than by the use of the law.

There is still tendency in a few quarters to use nut meats which are not of the proper quality. Those are matters which affect the health and the reputation of your products. For instance, it is not a good practice for the health of the community for them to be fed ice cream in which are rancid nut meats. And if that fact becomes known, it is not good for the business. So I would like to ask each and everyone to make a careful inspection of the nut meats in your products. The State of California and some of the foreign countries from which come the supply of nuts, have an abundance of good material. But at times, through speculation or carelessness, the nuts become rancid. We have at the present time some $25,000 worth of walnuts under investigation, endeavoring to solve the problem as to what use can be made of them without entailing too much to the owner. They are at the present moment, I think, being ground up for chicken

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

The Coon Ice Cream Company
Has 9 *CP* Refrigerating Machines

Coon have 2 *CP* Refrigerating Machines in their Lewiston plant, pictured above, which they have installed in their show window, thus attracting the attention of passers-by. This picture also shows several Wizard Vats.

The nine ice cream and butter-making plants of the Coon Ice Cream Co., of Burlington, Vt., have standardized on *CP* Refrigerating Machines because this company has learned that the *CP* System is not only superior to all others as far as design, construction and workmanship are concerned; but because of the wide range of sizes to choose from, they can get an installation that will exactly suit their requirements.

CP Refrigerating Engineers are ice cream plant and dairy plant engineers as well and can frequently save considerable money for the purchaser by suggesting new line-ups. Furthermore, a Creamery Package representative calls on them at regular intervals and if they are to retain the good will of The Coon Ice Cream Co., they must see that the Refrigerating Machines give good service throughout a long life.

If you care to talk over the refrigeration problem with people in your own industry, address

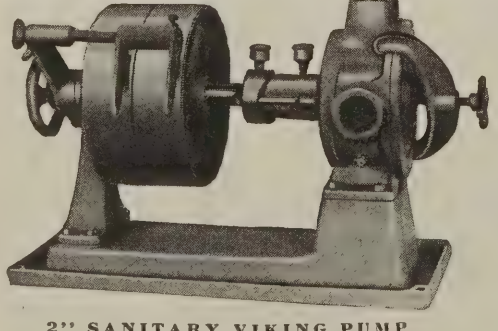
Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

feed. So you won't get any of those particular nuts. But at the same time, there are nuts scattered over the State from time to time which are not of proper quality, and you can't tell by the looks of them. It is necessary, especially in a case of Manchurian nuts, to test them in order to determine whether or not they are good. To illustrate that, I might mention one lot of nuts under consideration now, where tests were made from more than a dozen different packages of this one large lot, and we divided them up into two different classes or three different classes. The first class being the good nuts, then the second, nuts which were rancid or decomposed and which could be told by the color or appearance, and third, the nuts which appear to some as being good nuts. We found fifteen to twenty per cent of rancid nuts which could not be detected except by testing. But if those nuts were used in cakes or confectionery or ice cream, the customer biting into one of those badly rancid nuts would be disgusted and perhaps discredit that entire manufacturer's output of ice cream. So the only way we could tell, although there were a good many eatable nuts present, was to make some use of them other than for human consumption.

Those three points are the only ones I have in mind at the present time, and I trust you will all look into them: firstly, the use of any homogenized products sold under the name of ice cream, which is not a legal procedure, and especially if these products are not in good condition; secondly, the proper labeling and sale of your products, if they contain artificial flavor or color or both; and, thirdly, the use of such products as nutmeats or any other materials which may not be of proper quality. If you will observe those three points, as well as you have the matter of butterfat, we should come back next year and give you a great big compliment.

I thank you.

The President: I have no doubt some of you may have some questions you would like to ask of Professor Lea. I know he will be willing to answer any questions, if any should be asked. So feel perfectly free to ask him before the Professor steps down. Well, it must be exceedingly satisfactory to you, if you have no questions to ask.



Mr. Hightower: I have just a remark to make regarding the good of the industry, if I may do so, Mr. Chairman. Promotion and good of the industry to me in large measure means increased production, and I take this time to put a thought before you all of an experiment I have carried out this year. Increased production, as I say, is what we all are after—there is no question about that. To do that, we must first maintain and produce a quality product and pave the way so that this quality product will be delivered directly to the consumer without getting away and depreciating that quality. I have carried on a little private investigation of my own regarding the knowledge that the dealer has of taking care of the product. That is a serious condition, I believe, throughout the different parts of the State. The average dealer does not know how to take care of his product. Consequently, when it reaches the consumer, it is not as it should be, and the ice cream does not appeal to the consumer as it should.

There is another thing that I wanted to mention at this time regarding the good of the industry. The Ice Cream Supply Men's Association, is an Association which has been organized directly for the good of the ice cream industry, and I believe that this Association should go on record as recommending and commending an Association of that kind, and also go on record as encouraging the different manufacturers and jobbers in the State of California to organize an organization and affiliate with the National Supply Men's Ice Cream Association. I understand they are contemplating that, but some of them don't know whether the Association appreciates the code of ethics that has been laid down by the National Supply Men's Association. I believe everybody connected with the code of ethics of these gentlemen believes that it is certainly beneficial and for the good of our industry, because they are trying to co-operate with us and trying to line up the manufacturers who are not doing a legitimate business. In other words, we are offered goods and material and equipment of all descriptions at different times from different manufacturers, and some of them are misrepresented. If the manufacturer, jobber, or anybody, broker or anybody else, belongs to the Supply Men's Association, they cannot very well afford to mis-represent anything, and I believe that this Association should go on record as recommending such organizations, and give the supply men in this State the right thought that the manufacturers have regarding an association of this kind.

The President: A very good suggestion. Has anyone else any question or thought before we pass

this subject? If not, we will now call for the report of the Committee on Standards, of which Mr. Dryden is the Chairman.

* * *

REPORT OF THE COMMITTEE ON ICE CREAM STANDARDS.

By R. J. Dryden, Chairman.

CALIFORNIA AND SOUTHWESTERN STATES ICE CREAM MANUFACTURERS ASSOCIATION.

REPORT ON COMMITTEE OF STANDARDS AND LEGISLATION.

Members.

1. Robert J. Dryden, Oakland, Chairman.
2. Mr. C. J. Alfred, Los Angeles.
3. Mr. F. H. Bothell, Los Angeles.
4. Mr. F. H. Ames, San Francisco.
5. Mr. G. D. Turnhow, University Farm, Davis.

History and Programme.

On December 18, 1919, Mr. Charles G. Johnson, State Superintendent of Weights and Measures addressed a letter to our association suggesting that his office was interested in establishing a weight standard for Ice Cream. Prompted by this letter our association appointed a committee to work throughout the year gathering data and ascertaining various things having to do with Ice Cream standards.

The instructions given this committee were broad and unrestricted. It was the attitude of our association to thoroughly analyze the weight question and if possible to meet any constructive and progressive plan which would be of interest to the legitimate manufacturer and the public.

It was found by this committee that nowhere in the United States had the weight standard for ice cream been suggested officially by a State Department or any official body having the control of food standards.

The Dairy Division of the U. S. Department of Agriculture reported that the matter had never been discussed by them and that they were not authority for a statement regarding same.

The National Association of Ice Cream Manufacturers, a most progressive and strong organization, interested in the advancement of the industry, officially stated that the suggested California Weight Standard was impracticable and, to their knowledge, had never before been suggested as a standard for ice cream.

Because of a decided lack of available date upon which to base conclusions our committee met at the Oakland Hotel to organize a plan for original exhaustive investigation. It seemed advisable to call upon the following parties to meet with us in an advisory capacity.

1. Professor M. E. Jaffa, Dept.of Nutrition, U. of C.
2. Professor E. J. Lea, Director Pure Food & Drug Lab. Berkeley.
3. Dr. C. L. Roadhouse, Professor Dairy Mfg., U. of C.
4. Mr. Hoyt, State Dept. of Agriculture, Sacramento.

The advisory members of our committee it was hoped would be able to treat with us from an unbiased position, and help outline a programme for investigation. The outcome of this meeting was the following suggested plan.

1. Would a minimum standard of weight per gallon be a basis for control?
2. Would a standard of total solids be practical and would this tend to stabilize weight?
3. Has weight in ice cream a close correlation with food value?
4. Should ice cream be sold by weight, eliminating the liquid measure?

Dr. C. L. Roadhouse offered the services of the dairy division to gather data for our investigation. The following statistics were taken from these investigations as conducted under Mr. Turnbow and his assistant. The dairy division made no recommendation and drew no conclusions. However, our committee will offer at various times in this report suggestions which are the outcome of careful analysis of Mr. Turnbow's work.

1. Would a minimum standard of weight per gallon be a basis for control? It has been suggested that a high minimum standard per gallon be adopted as a basis for standardizing the weight of ice cream. I refer to the following table showing the weight per gallon of ice cream as drawm from three large mixes in three separate commercial factories in California.

Factory A. Mix 33.81 percent total solids.
Factory B. Mix 36.05 percent total solids.
Factory C. Mix 33.01 percent total solids.

Factory A Weight Per Gallon Separate Containers. Gallon Frozen

4.60 4.29 4.56 6.05 4.56 4.77 4.37 4.68 4.46 4.45 4.76 4.47

4.30 4.30 4.92 5.00 4.80 5.00 4.70 5.10 4.70 5.00 4.50
4.50 4.40 4.60 4.50 4.71 4.71 4.70 5.00 5.00 4.89

Average weight per gallon, 4.663 percent.
Maximum percent of variation above, 28.67 percent.
Maximum percent of variation below, 7.78 percent.
Extreme percent variation, 36.45 percent.

It is noted that there is a wide variation in the weight of ice cream from the same mix. This is decisively illustrated in the above tabulation. Closer examination reveals the fact that the variation was not attributed to any one particular style of freezer, temperature of brine, flavor of ice cream frozen, or any other noticeable condition. In fact the freezing was carried on as carefully as possible and for this reason these figures are valuable, in that they show the true problem which confronts the commercial plant.

2. Would a Standard of Total Solids be Practical and Would this Tend to Stabilize Weight? It has been previously suggested by our committee that the total solid standard might be adopted, presuming that the higher the percentage of solids, the more uniform would be the weight per gallon. However, we refer again to the commercial factories in the following chart. Here it is shown conclusively that there is no particular correlation between the percentage of total solids, and the variation in the weight of ice cream. One might even draw the conclusion that the higher the percentage of solids, the larger was the variation.

Factory A. 51.30 percent variation 33.81 percent solids.
Factory B. 98.00 percent variation 36.50 percent solids.
Factory C. 39.00 percent variation 33.01 percent solids.

It would be entirely practical to establish a standard of total solids per gallon, but from the conclusions drawn from the above table it seems of no particular advantage so far as regulating the uniform weight of ice cream is concerned.

3. Has Weight in Ice Cream a Close Correlation with Food Value? In the following chart as suggested by Professor R. M. Washburn, University of Minnesota, it is clearly shown that the weight of ice cream has no correlation with the food value per gallon. If the percentage of overrun is increased in the same ratio as the percentage of total solids, the food value per gallon will be just as great in ice cream weighing 30 pounds per gallon as that which weighs 50 pounds and contains a less percentage of solids. Therefore it is readily seen that the basic weight of 1 gallon of

ice cream is of no particular value unless the percentage of food solids is taken into account.

Total solids	Weight of gallon of mix	Weight of gallon of ice cream	Weight of total solids in gallon of ice cream	Per of overrun
30	8.80	5.0	1.50	76.00
33	8.95	4.5	1.50	96.6
37.5	8.90	4.0	1.50	122.4
42.8	8.95	3.5	1.50	156.0
50	9.00	3.0	1.50	200.0

If the sugestion were carried out to adopt a standard of food solids per gallon it can be seen that weight per gallon would be of no particular significance. If it were possible to associate a standard of percent food solids and weight per gallon ice cream, then we would arrive at a standard of real value. As it is, the determining factor is the inability of the manufacturer to control the weight whether the solid content is high or low.

4. Should ice cream be sold by weight, eliminating the liquid measure? For our committee to properly answer this question, we must of necessity consider the following factors.

1. Manufacture and distribution wholesale.
2. Retail purveyor and buying public.

Manufacture and Distribution Wholesale.

For the wholesale ice cream manufacturer to put up ice cream in containers to sell by weight would require the complete revolution of present manufacturing methods and equipment. Under these conditions, it would require the tare weight to be marked on each container, the cream would then have to be weighed as it is drawn from the freezer. Ice cream being frozen product, requires that it be handled with all expediency possible to preserve its quality. After being drawn from the freezer, the weighing and tagging necessary under these methods would therefore be a serious handicap.

Retail Purveyor and the Buying Public.

Providing ice cream were sold to the retailer by weight we find various seriously objectionable problems to meet. From this standpoint, ice cream as we all know melts readily and if it were necessary to weigh and handle it we are sure that the practice would be very distasteful and certainly would be a serious handicap toward pleasing the public. In the case of brick ice cream the problem would be to weigh separately each brick and if we should find a 90 percent variation or less, as was previously illustrated in this report, it can readily be seen that the retailer would have a hard problem convincing the purchaser why he should pay as much for one pint today as he did for one pint and one half yesterday.

In treating this problem we might add that the retail seller of ice cream absorbs the shrinkage in handling between the wholesaler and the public. If ice cream weighs 4½ pounds to a gallon, when it is dipped either for cones, dishes or to be packed in paper buckets it will weigh on the average of 15 percent to 20 percent more in equal liquid displacement when sold to the consumer.

These are facts which we manufacturers realize. The retailer also appreciates this fact and naturally regulates the margin between wholesale and retail in order to cover up this discrepancy. The public on the other hand actually gets more food value in a quart container of dipped ice cream than in a quart brick. Our observation is that the public is gradually buying more brick ice cream not because they do not appreciate the fact that they would get more food value in a container of "dipped" cream but because they feel more secure in trusting the manufacturer to measure the ice cream as is done in the form of bricks.

Conclusions

It would be the idea of our committee to carry these investigations on at considerably greater length and try if possible to show the cause for the extreme variations in the weight of ice cream out of the same mix. We would suggest that the following factors be determined:

1. Does the temperature of the mix or the brine have any effect upon the variation?

2. Does the proportion of sugar have any appreciable effect towards stabilizing the weight of ice cream?

Also as illustrated in the following table, chocolate and strawberry ice cream which naturally contain more sugar show less variation than did vanillas.

3. Does the percent of total solids have a relation to the variation of weight.

Fct.	Flav.	Low. wt. per gal.	Wt. of solids	High. wt. per gal.	Wt. Sol. per gal.	Vari-ation	Total solids
A	Vanilla	4.00	1.352	6.052	2.066	51.3 %	33.80
B	Vanilla	3.03	1.092	6.00	2.163	98.00%	36.05
	Straw	3.379	1.218	4.958	1.787	46.7 %	
	Choc.	4.479	1.615	5.20	1.875	16.09%	
C	Vanilla	4.30	1.419	6.0	1.981	39.53%	33.01
	Straw	4.40	1.452	4.71	1.555	7.05%	
	Choc.	4.80	1.584	5.11	1.687	6.46%	

In concluding this report (and we do so, mindful of the importance which is placed upon it) we are most certain that until we can ascertain the cause and correct same, that the uncontrollable variation in the weight of ice cream will prohibit the setting of a standard. We as an organization, however, should appreciate the sincere endeavor of Mr. Johnson to wait patiently for the cold facts. We hope he will appreciate the open frankness with which we have attempted to get this information for him. We want him to know that in our earlier investigation, we felt that a standard could be adopted. Now we can only say that until our knowledge of this problem is better, that we have no other suggestion, but to educationally and otherwise try to more uniformly manufacture our product. It is quite possible that through Mr. Johnson's forethought in the conduct of his duties that he has shown us a weakness which we now realize, and must strive to correct.

Mr. Dryden: There is possibly no one thing among the manufacturers of ice cream in this country that has attracted quite so much attention as the local situation in California, that has been suggested by our State Superintendent and Sealer off Weights and Measures, Mr. Johnston. A year ago, or thereabouts, Mr. Johnston suggested to the manufacturers, the ice cream manufacturers of this state, that he proposed to investigate the standard of selling ice cream by weight. About that time our association met at Catalina Island, and a committee was appointed to spend the time throughout the year investigating and gathering data relative to the advisability of considering a standard as suggested by Mr. Johnston. We have had, during the year, communications with our National Association, the federal department at Washington, the Pacific Coast Association, and individual authorities on subjects akin to this question, and we can say frankly that in no instance have we received any authentic data, or a suggestion, or have we found any organization or individual suggesting this particular proposition, other than Mr. Johnston, of Sacramento. We found that we were not in possession of any data or information to present to Mr. Johnston regarding this problem. It was with that thought in mind that our progressive manufacturers, thinking that Mr. Johnston's suggestion might have some merit, investigated this problem from the standpoint of food value. The committee that was appointed met here in the Oakland

Hotel several months ago, and at that time we notified the principal agencies of the state, who were more or less allied to our particular work, Mr. Hoyt, of the State Department of Agriculture, Professor Lea, who was directly in charge of the control of the butterfat standard and other standards in ice cream, and Dr. Roadhouse, in charge of the Dairy Department of the State University, and Professor Jaffa, of the Department of Nutrition, University of California. We had considerable discussion, and we tried to get a basis upon which to carry on our investigations. It was decided that at this meeting we would take the attitude that we could suggest some improvement in our standards for ice cream. We proceeded along the line that the percentage of total solids in ice cream should be regulated with a view of improvement in ice cream generally throughout the state. At that meeting, Dr. Roadhouse offered the assistance of his department, and they have since carried on, I believe, the most complete and accurate work for data relative to this particular problem. Professor Turnbow and his assistants spent considerable time gathering data relative to the weight of ice cream. They gathered it under varying manufacturing conditions. They went right into the factory and tabulated it, and it was considered from practically every standpoint. They did not confine their investigations to small can freezers, as was sometimes the case for carrying on such investigations. I want to point out that our committee has carried on this work, and we have come to this conclusion and this recommendation only, that it is impractical to attempt to control the weight of ice cream; that it is also definitely proven, so far as our figures are concerned, that the percentage of solids in the mix has no governing effect upon the regulation of weight of the individual sample of ice cream.

We have, as a matter of illustration, three exhibits, large packages of several hundred pounds of mix, frozen in three separate commercial plants, and under Exhibit A we found that there was 39.53 per cent variation in the weight of the ice cream, and, running down the line briefly, the first container drawn from that package of cream weighed 4.5 pounds per gallon. It jumped up, a similar package in the same factory, to six pounds per gallon, and we had these weights: 4.6 pounds, 4.7 pounds, 4.5 pounds, 4.6 pounds, 4.6 pounds, 5.2 pounds, 4.4 pounds, 4.4 pounds, 4.8 pounds, and 5 pounds. That particular mix contained 32.01 of total solids. It was below the standard that I really thought should be recommended. Take the other extreme. A mix contained 36 per cent total solids, and we found the biggest variation under this particular condition—we found that there was something over 60 per cent difference in valuation between the weight of ice cream drawn, and in that particular package. It was a large package of some 300 gallons of mix and was completely homogenized, as drawn into the freezer, and under practical conditions there was some sixty per cent variation in the different weights. It showed conclusively that, as we operated manufacturers in a practical way, for this factory, the yield, as Mr. Miller terms it, is not controllable to the point where we can base a standard of weight or of food value. If we recommend a standard that had sufficient tolerance to allow for this fluctuation, the law would be of no value, and unless we can suggest a method of controlling these factors, the law would be worthless, because there would be nothing left by which we could control these factors. Under other conditions we had about 34 per cent total solids. There were several hundred pounds of total mix, and we found 51.3 per cent variation in the weight of the ice cream. We discussed this matter with the Federal Department. It had never been brought to their attention before, and they had no suggestion to make. We feel that this is a premature suggestion on the part of the State Superintendent and Sealer of Weights and Measurs, and we desire to meet with Mr. Johnston in Sacramento and show him our figures and discuss this problem, and we think that until sometime in the future, when, as progressive manufacturers, we can try out certain of these problems in our plants, that no legislation should be undertaken, and we think that if we have an opportunity to make a full explanation to Mr. Johnston, he will understand our problem and dismiss the matter. We have not taken the attitude to stop this measure, but we have looked at it as progressive manufacturers, and I think that the people will bear us out in this impression, that it is our object, if possible, to suggest the standard which will have a beneficial effect upon the manufacturing of ice cream. And I can only say for our committee that the further we went in our investigations, the more determined we were that the problem was not controllable, and until such time as it is, the matter should be dismissed, and that that should be our recommendation to Mr. Johnston.

I would like to have some discussion of this matter, and I would like to call on Mr. Hoyt for a word. Mr. Hoyt acted in an advisory capacity to our committee and gave us the assistance of his department, and if you will allow Mr. Hoyt to say just a word, I want the members to know him, because he is in this respect instrumental in the welfare of our particular business.

The Persident: We shall certainly be very glad to hear from Mr. Hoyt.

CLEVELAND, OHIO

Address of Mr. C. F. Hoyt.

Mr. Hoyt: I am not prepared to offer you any assistance in this particular thing, as the gentleman has just stated, I was invited to attend this meeting held here in this hotel concerning this matter of a standard for weight for ice cream, and I may say here that that was the first that I knew that there was any such movement on foot. Who is promoting the movement, or what the reasons may be for requiring such a standard as this that has been suggested, I don't know. Possibly, therefore, you will pardon me if I do merely say a little something of what the work of the State Department of Agriculture is, as it relates to this industry. Perhaps some of you gentlemen do not know what the State Department of Agriculture is. In years past, as you know, the enforcement of the laws relating to the dairy industry was in the hands of the State Dairy Bureau. The last legislature created a State Department of Agriculture, by consolidating into one the various commissions and bureaus that were in existence. Among them was the State Dairy Bureau. Therefore, the State Department of Agriculture is now charged with the enforcement of the laws relating to the dairy industry, the sanitation of dairies, the standards of dairy products, and the various laws that relate to the dairy industry, and ice cream is declared by the law to be a dairy product.

We have not done nearly the amount of work that I wish we could have done in this respect. The department was created for promoting the agricultural interests, and has at its head a practical agriculturist, Mr. Hickie. He has been in close touch with the men engaged in agricultural pursuits relating to fruit growing, and things of that sort, and I believe that through that close touch those industries have had great benefit. He has not yet had the opportunity of getting into such close touch with you gentlemen engaged with the various industries relating to dairing as he would have liked, and I feel that this is a misfortune, because I believe that through establishing that understanding between the present agricultural commission and the various interests represented here, there can come to the industry great good. I am sorry he is not here.

I have felt that it would be to your own advantage to have the present system of holding the meetings of the various industries that are allied to make up the larger industries held separately, that it would be better to hold them jointly.

Since we have undertaken this work, we have appointed a man to be particularly a factory inspector. The idea of that was that that man would become familiar with factory operations, and he would thereby be enabled, not only to enforce the laws relating to the factory organization, but he would become more familiar with such matters so that he might be of some real assistance to the men engaged in those factory operations. We have now asked the legislature for another man of that sort, and that recommendation has been approved by the budget committee, and we hope we will have another man who will be well trained in the same lines of factory operation, so that we can place that knowledge at the disposal of the people of this state. We have also asked for more money for the support of our laboratory, so that we can do more work there, and which will result not only in the better enforcement of the dairy law, but in the promotion of the dairy industry in all of its branches. There is a section of the law dealing with the returned containers which have been shipped out by manufacturers of ice cream to consumers. There have been some results so far, but we hope to do much more work along that line.

I don't know that I have anything further to say, Mr. Chairman. As I said, I have nothing that I can say toward this particular question under consideration. All I can do is to promote the good will, so to put it, of our department toward your industry, with the hope that our department may become to be regarded as an instrument for the promotion of your business.

The President: I think the major portion of any discussion of this subject in any of its phases had better be delayed until we have heard the paper of Professor Turnbow on a very closely kindred subject.

Mr. Dryden: I want to say one word regarding the University Farm at Davis. The information came to me yesterday that the department there would be glad to receive an open expression from our association here relative to this work which they have carried on, and I, for one, think that when you hear Professor Turnbow's paper and see the detail with which they have gone into the matter, in order to get us this data, that it will be in order for our association to write the University Farm at Davis and thank them for this co-operation, which in a measure will perhaps facilitate the work of that department in getting a little more co-operation in problems of this kind, which involves state expense, and I know that we have been grateful to the Dairy Division for this data which they have gotten. Upon the basis of their investigations, we have drawn our conclusion. And I would suggest that the association pass a resolution to that effect.

The President: We will now hear from Professor Turnbow.

* * *

ARE UNIFORM STANDARDS OF QUALITY IN ICE CREAM PRACTICABLE, AND IF SO ON WHAT SHOULD THEY BE BASED?

By Prof. G. D. Turnbow, of the State Dairy School.

Before I start on this, gentlemen, I want to be plainly understood that I am not going to recommend any standard for ice cream. I want that plain.

There has been such discussion of late as to standards for ice cream. Undoubtedly, from the standpoint of fairness to all concerned, there should be some standard established for the finished product. Just what that standard should be, however, in order to be practicable and workable, is so largely a question of personal opinion or judgment, rather than being based on any absolute facts, that much divergence in opinion, as to the ideal product, between individuals having varied interest within a state, as well as between the different states, is to be expected.

Up to the present time there has been more agitation as to the adjustment of the fat content than any other constituent, and it is generally conceded to be one of the most important ingredients to be taken into consideration. The percent requirements for fat varies greatly with the different states, for instance: a few states have standards as low as 6 per cent, several 8 and 9, quite a few 10, others 12, and a few require 14 per cent fat. Thus far, you see, even the requirements for fat has approached no definite standard, since there is over 100 per cent variation in the fat requirements between one state and another.

A certain amount of fat is desirable from the standpoint of palatability. A cream carrying from 11 to 12 per cent fat, is probably most palatable to the greatest number of people, and if the margin allowed for manufacture would permit, should be recommended. To increase the fat content beyond this figure would be of no advantage, for no doubt the consumption would be de-

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

creased by so doing, for the public as a whole finds a cream of high percent fat less desirable.

Prof. R. M. Washburn, one of the best authorities on ice cream has gone on record in the May, 1919 issue, of the Milk Magazine as recommending a 9.8 per cent fat content. In a recent letter from Professor Washburn, he states as follows: "Briefly, my judgment is that there should be a fat standard of 10 per cent for plain vanilla, 8 per cent for fruit, nut and chocolate ice creams. This difference is in order that the regular vanilla mix may be used for the other kinds of ice cream, and the dilution, by adding the chocolate, fruit, etc., will be taken care of by the lower standard, which even at that will cause the special creams to cost more than the straight vanilla."

G. D. TURNBOW

So much from the standpoint of fat content. Now let us turn to the consideration of another possible basis for obtaining a standard product, which, according to Professor Washburn, if I may be permitted to quote him again, is the only practical standard that can be used in ice cream, and that is the absolute standardization of the minimum weight of food solids in a gallon of ice cream.

Montana has already seen fit to require that the mix from which the ice cream is to be made shall not contain less than 33 per cent total solids; this is only one step, however, and does not solve the situation, for the yield which can be made to vary, may cause a variation of approximately 25 per cent in the true food value of a gallon of ice cream. We all know that the greater the percentage of total solids the higher the yield, though we may still deliver the same amount of food value per gallon. If you were to fix a standard on a percentage of total solids basis, without a stipulated weight of solids per gallon, a large swell would defeat the purpose of the law. To illustrate this point, I call your attention to Table I. (All the figures that I am going to give you are taken from commercial plants from regular runs.)

Table I.

Exhibit	% of T. S. in Mix	Desired Yield	Total Wt. of I.C.	Total Gals. of I.C.	Wt. Per Gal.	Wt. of Sol. per Gal.	Flavors
A	33.80	100	731.194	166.37	4.395	1.4886	All
B	36.05	110	1731.164	410.313	4.219	1.5209	All
C	33.01	100	1180.50	253.16	4.663	1.5393	All

You will note that if the standard should require a certain percentage of total solids, say 33.0 per cent, as does Montana, Exhibit A would only deliver to the consumer total solids at the rate of 1.4886 pounds per gallon. Under the heading of "Desired Yield" I wish to state that it was the aim of the manufacturer to pull his batch when this 100 to 110 per cent yield was obtained. In two of the exhibits a Mojonnier overrun tester was used. In the other exhibit the operator depended upon his skill. In Exhibit B there was a marked increase in total solids of the mix, a little higher yield was aimed at and, as a result, the consumer was but little better off than before. The difference in weight per gallon being only .0326 of a pound more than that of Exhibit A.

In Exhibit C we have 33.01 per cent total solids in the mix, with a cream weighing 4.663 pounds per gallon. Still we deliver 1.5393 pounds food solids per gallon, as you see, a trifle more than either Exhibit A or B. From these figures and the general knowledge of everyone familiar with the manufacturing of ice cream, it can readily be seen that a standard requiring any definite percent of solids in the mix, without stipulating the weight of solids per gallon of ice cream, would be worthless.

Considering then the standardization of ice cream on the basis of total solids, let me call your attention to Table III, which illustrates the necessity of careful study before a definite standard should be required.

Table II.

Exhibit	Flavor	Lowest Wt. per Gal.	Wt. of Sol. per Gal.	High. Wt. per Gal.	Wt. of Sol. per Gal.	% Variation	% T.S.
A	Vanilla	4.00	1.352	6.052	2.066	51.3	33.80
B	Vanilla	3.03	1.092	6.00	2.163	98.0	36.05
	Straw.	3.379	1.218	4.958	1.787	46.7	
	Choc.	4.479	1.615	5.20	1.875	16.09	
C	Vanilla	4.30	1.419	6.0	1.981	39.53	33.01
	Straw.	4.40	1.452	4.71	1.555	7.05	
	Choc.	4.80	1.584	5.11	1.687	6.46	

In Exhibit A you will note that the weight per gallon of ice cream varies from four pounds, as the lowest figure, to 6.052 pounds, as the highest. This gives us a weight of total solids per gallon in the first instance of 1.352 and in the second of 2.066, or a variation within the mix of 51.3 per cent. In Exhibit B we find a variation in vanilla of 98.0 per cent. In the latter case we started with a mix of lighter per cent total solids and the resulting ice cream had the lowest total solids per gallon, or 1.082.

In Exhibit C practically the same thing holds, except that the variation is not quite so great. It will be noticed that in Exhibits B and C both strawberry and chocolate are quite uniform in weight. From these figures you can readily see, with the present methods employed, the wide variation that is likely to occur within the same mix.

The question has arisen, is any particular draw within the batch responsible for this variation in the mix. To investigate this phase of it I have prepared some tables for your consideration.

Table III.

Exhibit	% of T.S.	Draw	Total Wt. of I.C.	Total Gal. of I.C.	Wt. per Gal.	Wt. of Solids per Gal.	Flavors
A	33.80	1st	298.438	68.000	4.389	1.483	All Flavors
A	33.80	2nd	189.063	43.250	4.371	1.477	All Flavors
A	33.80	3rd	178.813	40.428	4.423	1.494	All Flavors
A	33.80	4th	64.880	14.694	4.415	1.492	All Flavors

You will note that the greatest variation comes near the middle of the batch, indicating that the yield is slightly lower in the last drawn. In this exhibit we are dealing with a mix carrying only 33.8 per cent total solids, including all flavors. From this exhibit we note the variation in weight per gallon is very

slight, being only .022 pounds solids per gallon, a figure too small to be considered.

Table IV.

Exhibit	% of T.S.	Draw	Total Wt. of I.C.	Total Gal. of I.C.	Wt. per Gal.	Wt. of Solids per Gal.	Flavors
B	36.05	1st	674.688	159.93	4.219	1.521	All Flavors
B	36.05	2nd	660.375	158.06	4.178	1.506	All Flavors
B	36.05	3rd	288.001	68.56	4.201	1.514	All Flavors
B	36.05	4th	101.313	23.763	4.263	1.537	All Flavors

In Table IV, Exhibit B, we have a little different proposition in that we have a 36.05 per cent total solids and a little larger volume. The result is a very slight variation in weight per gallon and a trifle larger weight of solids per gallon. The second draw in this case shows the lowest weight per gallon. I have heard that statement made that so much skill need not be exercised in turning out a uniform product when a mix of high solid content is used, this table would seem to substantiate the idea.

Table V.

Exhibit	% of T.S.	Draw	Total Wt. of I.C.	Total Gal. of I.C.	Wt. per Gal.	Wt. of Solids per Gal.	Flavors
C	33.01	1st	509.00	110.00	4.627	1.527	All Flavors
C	33.01	2nd	506.00	110.00	4.600	1.518	All Flavors
C	33.01	3rd	165.50	33.16	4.991	1.648	All Flavors

In table V, Exhibit C, this is again borne out. We have a low solids mix and a variation of .13 pounds per gallon. There is a decrease in yield in the last drawn cream as is the case with other tables considered.

In Table V, Exhibit C, this is again borne out. We have a low solids mix and a variation of .13 pounds per gallon. There is a decrease in yield in the last drawn cream as is the case with the other tables considered.

Table VI.

Exhibit	% of T.S.	Draw	Total Wt. of I.C.	Total Gal. of I.C.	Wt. per Gal.	Wt. of Solids per Gal.	Flavors
ABC	35.55	1st	1482.126	337.93	4.385	1.515	All Flavors

ABC	34.61	3rd	632.314	142.148	4.448	1.539	All Flavors
AB	35.17	4th	166.193	38.457	4.322	1.520	All Flavors

Table VI shows a summary of Tables III, IV and V. It will be noted here that when the three exhibits are considered together we have a quite constant weight per gallon, as well as weight of solids per gallon.

Suggested standards in the past based on weight per gallon have named a figure considerably higher than this table would indicate to be practicable.

Considering a standard based on the weight of total solids per gallon, some authorities have recommended from 1.4 to 1.6 as the desired figure. From these tables it would seem that a 1.4 per gallon would be a reasonable figure for the manufacturer to stay above, and at the same time the consuming public would be assured a desirable food product. Just how practicable the enforcing of such a standard would be, is a question worthy of considerable study.

With a figure as low as 1.4 we find as much as 6.2 per cent of the ice cream considered in the three exhibits falling below it. With 1.4 as a standard, it would necessitate a smaller yield in order to keep all

the cream safely above the margin. It is true that some of the cream might be pretty heavy and have a tendency toward "sogginess", but a lower percent total solids requirement would deliver to the consumer a cream lacking in palability as well as food solids.

Exhibit A had a butterfat content of 10.25, Exhibit B of 10.50, Exhibit C of 9.92. All samples were taken at equal intervals during the day's run. The agitating coils were kept rotating continuously during the freezing of Exhibit A. In Exhibit B the coils were not kept rotating continuously during the freezing, but were rotated at approximately three equal intervals. In Exhibit C the same procedure was followed as in Exhibit B.

Exhibit A showed only .8 of 1 per cent variation in the percent of total solids, while both B and C showed a variation of 1.2 per cent. This does not mean that the coils should be kept rotating, however, for the body of the ice cream must be considered.

I am not yet ready to say that these figures give us enough information to draw any definite conclusions or to suggest any definite standard for ice cream. I do believe, however, that there should be a standard, but the details upon which this standard should be based is also a question for further study.

A a step toward determining a fair and workable standard, I have compiled these tables for your consideration from regular runs of commercial plants. They do not prove anything, but do suggest a few methods of approaching the subject. As a result of my investigation I submit for your consideration the figure of 1.4 pounds of solids per gallon of ice cream as being within reason from the point of view of solids.

Before California should set a standard, great care should be exercised so that when once adopted it may be practicable and fair to all concerned.

The President: Gentlemen, this certainly is a thing that is worth while, if we had nothing else to come before us at this convention. The results of the work done by this committee, as shown in this committee report, and the report of Professor Turnbow, are certainly worth while. The subject is before you, and we have some time that we can give it still further. Let me ask you, Professor Turnbow, at the limited time at your disposal in connection with this, were you able to give any study to the question or form any impression as to what might be the explanation of so wide a variation? Not that I am assuming that you have determined anything of that kind, but I wondered whether you had touched on that question and studied it any, or whether it had better be reserved until we know something more about it.

Professor Turnbow: I can make this statement, that from my limited study of this subject, and you will recall that this was passed to me about twenty-two days ago, and my Christmas vacation and everything else I had on this winter, went in order to get ready with this—from my limited study I think it is a supply man's problem to fix a machine that will control the overrun.

The President: A very excellent suggestion. It is up to the supply men, is it not?

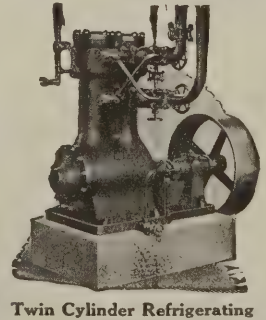
Mr. Wilson: Would it not be a good idea to hear from Mr. Bennett on that question?

Mr. Dryden: Mr. Bennett could not do it, because the overrun scale was used in two instances.

Mr. Henderson: There are a good many factors that enter into that matter.

Mr. Platt: I admire Mr. Henderson's modesty in not saying that the new mixer and the new freezer will do the trick.

Mr. Henderson: We have adopted a code of ethics, you know, Mr. Platt, and we want to tell the truth.



The President: Anything further on this topic, gentlemen? We have some time yet.

Mr. Platt: I might say that the National Association deems this topic very important, and it is the intention of the Secretary of the National Association to meet in Sacramento with us when this matter is discussed with Mr. Johnston, and we feel that, with the backing of the National Association, there should be no trouble whatsoever in showing Mr. Johnston the inadvisability of such a law.

Mr. Wilson: Mr. Chairman, I had a letter from the President of the Pacific Northwest Association just a few days ago, and I meant to bring it here with me. Several of the members from the northwest want to come down to Sacramento when we have this meeting at Sacramento. They would like to be notified, and they will be there. They are very much interested in this problem.

The President: One of the purposes, I take it, in continuing a permanent Committee on Standard,s and a large and strong committee, was that the handling of this whole question should be in the hands of the committee that has been making a study of it; and I think it is understood that it is up to that committee to arrange immediately, upon the adjournment of this convention, a date when a hearing can be had before Mr. Johnston, before any attempt is made to either draft a bill or introduce a bill on this subject, and the wire that I sent last evening to Mr. Martin was to that effect, that we were expecting to be able to arrange for such a meeting some eight or ten days hence. I thought that would give time enough for those peo-

Telling's Fancy Centers for Brick Ice Cream To Promote Sales

Now the rush is over, it is time to prepare for your winter season and keep up the sales of Ice Cream.

There is no better way to promote the sales of Ice Cream than to get an outfit of assorted Centers and use different designs and coloring to beautify your goods for the Fall and Winter season.

The different designs are always attractive and the combinations can be changed often.

An outfit consists of one twenty hole rack, $25.-00; one twenty hole filler, $10.00; one paraffine can, $6.00; and twenty centers at $2.00 each, total $81.00. (The centers may be assorted if desired.)

We have beautiful designs for many occasions, such as Heart, Club, Diamond, and Spade, for Card Parties, Xmastree, Bell, Hatchet, Pumpkin, Shamrock, Egg, Five Point Star, Red Cross, Maltese Cross, Penn. Keystone, Masonic Keystone, Crescent, (Also small star to use with Crescent for Masonic) Six Point Star, (Jewish Emblem) Triangle, Slipper, Arrow Head, (To use when Mint Ice is used for center.) Also the Scotch Thistle with core to make the Pink Blossom. (This is nice for Scotch Society.) All made of good 2X tin, 27 inches long to use in a standard two gallon brick Pan. (Two centers are to be used in each pan.) When cutting, cut the brick twice the length as formerly and split lengthwise and the design will be lengthwise of the brick.

We can supply the Alphabet and Numerals in quart lengths made of Copper tinned, so that the Age or Initials of a person may appear in the brick. These sell at $4.50 each and 50 cents for the square quart can and two covers.

ple to get here, and also not an unreasonable time for Mr. Johnston to grant us. I am confident that by night I will have a wire as to what we can depend on there. But that will cause it also, the committee, to prepare, and when the committee goes to Sacramento they want to go, not only unanimously, but they want to go well prepared and have as many of the people interested on this subject, that is, of food people, food commissioners, agricultural college people, and other representative officials of the State who are interested, as may be, as well as people outside of the membership of the committee who are posted on the subject, and also such outside help as we may enlist, such as National Association representatives and officials or representatives of the Pacific Northwest Association. They are all vitally interested in this subject, so that when that hearing is arranged for, we can fully perceive the pressure that we will have and strength for accomplishment when we go there. Have you any further suggestions, Mr. Dryden, as to plans for the future?

Mr. Dryden: No, I have not.

The President: I am hoping before the banquet this evening that I can get further information from the National people on this question.

Mr. Henderson: Mr. President, in the matter of standards, there is one proposition that does not come in exact connection with your weights, but there has been in this state, and is at the present time a tendency to adopt different size of bricks. We have on our records now over twelve different sized bricks used in this state—different dimensions. That is going to lead you to a multiplicity of troubles, costing more for brick moulds and for cartons, because they are not standardized. You would buy brick moulds much cheaper and cartons much cheaper if you would establish a standard sized brick in the state. The tendency is to get more and more, instead of reducing the number of moulds.

The President: Why should you ask us that question—it is not up to the supply men?

Mr. Henderson: But it is the individual man who demands it.

The President: You gentlemen make the moulds and make a dozen different varieties. Why not standardize your moulds?

Mr. Henderson: You tell us what to standardize on, and we will do it. We can't tell what you want when you have twelve or fourteen of them.

Mr. Dryden: The most unusual sizes in use in the United States are used by the Crescent Creamery, and they make their own, I understand, down there.

The President: Are we too large, or too small, or the shape not right? What is the trouble?

Mr. Dryden: As I understand, there are two distinct shapes of bricks, that is, the western mould and the eastern mould. In the Crescent brick, the cross-section is square, the height is the same as the width, while the red brick, as it is known, is a little flatter than its height, that is, a little wider. The western mould is a flat brick, but the length is about 7¾ inches, and the eastern brick is a little over 6—6¼ I think.

The President: I think the trouble is that you gentlemen do not appreciate the effort the Crescent made to raze the way in setting a type that would be practicable on which to standardize. There are so many different brick forms on the market, and all subject to so many objections, we found it was difficult to get a form that seemed to have all the points in it, so that we were forced to correct some of the faults by mak-

ing our own, and there are several advantages. In the first place, I think any brick should be a standard quart brick in contents; if it is going to be sold as a quart, it has got to be a quart brick, or else quit labeling it as such, and very many of the forms do not hold a quart. Another thing is that a brick package, to work it right, should be a uackage that is uniform and will pack square in a packer or in a can or in a wrapped package, and two of the pints should exactly correspond with the quart, and in any form in which you turn them over, either way, and it is an admirable shape to put out to the wholesale trade. A quart brick in a packer that is packed, that takes the smallest size of can, and which is so rapid as to handle it in packing it and putting it up in packages where we put up an assortment of bricks in a package, sell a quart or two of this and a pint or two of that, I think should be in the shape so that we could put up a package with a brick that is convertible, and that we could not do with the style of brick that is of irregular shape. Those are some of the advantages of a uniform brick like that. There may be disadvantages also, but those are some of the things that brought us to the adoption of that standard form.

Mr. Jacobson: I think, Mr. Carver, that I recently had occasion to check up the brick slips, and I have not found any two alike in measurement. I believe it would be to the advantage of the Association if we were to put that question up to the National Association, with the idea of standardizing the size. In the first place, when you order brick slips from the can manufacturing concern, you insist upon the guarantee that they carry the quantity called for by the Sealer of Weights and Measures under the present system. Now there are no two sizes alike.

The President: Do you find that the average of them are up to the requirements of the law as to the quart in contents?

Mr. Jacobson: Yes.

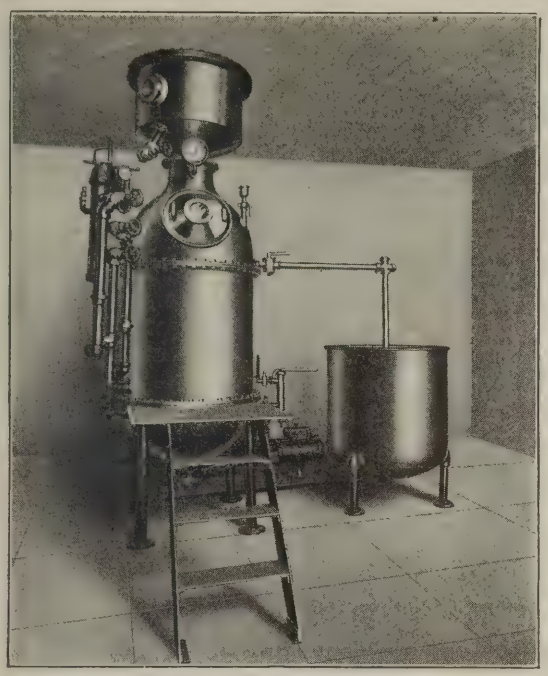
Mr. Love: In the season, we ordered one hundred 8-quart slips. They came, and they were all right, the size was all right. Then we said we would have to have another order of those slips, and we ordered another hundred and they were entirely a different slip, they were shorter, the carton used for the first could not be used at all on the second. All the requirement we made was that they be up to standard. That is just the point against the supply man there, that they ought to have uniformity—and more than that, we took particular pains in ordering the second time to tell them to send them the same as the others, and we got an entirely different thing and couldn't get it changed, that is, we sent them back to be changed, and then they told us they could not give us anything else. and we had to take those slips, because we had to have them.

Mr. Jacobson: It should be standardized.

The President: Any further discussion of the brick mould question? I think we should probably proceed with the balance of the afternoon's program, if there is nothing urgent or further upon that subject now. Is there any unfinished business—before we pass to reports of committees? It will be next in order, if there is any. I hear of none, so we will pass to reports of committees.

Mr. Hightower: I brought up the subject just a few minutes ago regarding the supply men. I would like to have an expression from the members as to whether this Association wants to go on record as recommending, from our standpoint of its being a good thing for the industry, for those supply men in this state to organize and affiliate with the National Supply Men's Association? I believe that it is an important thing. Those people have organized with a view of helping this industry, and incidentally helping themselves. I think this Association ought to go on record as being in favor of that. It is not a matter of trying to eliminate anybody from selling goods, but simply trying to encourage the manufacturer and dealer to want to organize an association, to affiliate with the National, if the gentlemen in this state who are manufacturing ice cream think it is a good thing for our industry, and I personally think it is a very good thing. We need their co-operation, and, of course, they need ours.

The President: We all feel very kindly, of course, toward the supply men, and wish them to understand that we appreciate them. Yet the problem of whether they shall affiliate with the National Supply Men's Association, or not, is, it seems to me, their own problem. Anything that we might say would have very little bearing on that. But I think it is entirely proper if we want to express our good feeling and wishes for their welfare, etc., to give whatever encouragement we can. But why do they need to ask our endorsement of a plan for their affiliating with their own National Association? It is perfectly proper, of course, any expression we desire to give them.



Mr. Hightower: That question has been brought to my attention, Mr. Chairman, from this viewpoint: that there are some of the manufacturers and jobbers throughout this state who do not think it is necessary to get into an Association of that kind, and I believe that if this Association were to go on record as recommending that, which is a proper thing, it would certainly promote the interests of the ice cream manufacturers, for the reason that if I am in the market for a particular piece of machinery, or going to make some additions to my plant, these people, different members of the Supply Men's Association, will write in to headquarters and tell them, and they will put that information out to everybody who manufactures a piece of machinery, giving me a chance to investigate several different pieces of machinery. That is one of the things that will be beneficial to the ice cream manufacturer, I don't care where he is located. We don't know all the things on the market, and this Supply Men's Association being in force and affiliated with the National, will give everybody in the country a chance to investigate everything that is on the market. That is the point, and that is why it is in our favor.

The President: Mr. Henderson, what suggestion have you? Would the supply men like to have us do that?

Mr. Henderson: We would like all the business we can get, Mr. President.

Mr. McFarland: If the supply houses do not see fit to join the National Association, of course that is for them to determine, and I hardly know just what to say by way of adding to what few remarks I have heard in this discussion. It is easy for any manufacturer in the West, if he so cares to do, to ask a man whether he is affiliated with the Ice Cream Supply Men's Association. The Ice Cream Supply Men's Association has a code of ethics that we are trying to follow. If you are purchasing goods from any concern that is not affiliated with our Association, of course that is up to the manufacturer himself, because it would not be right for the Association of Supply Men to try in any way whatsoever to dictate the policy of buying anything which may happen to be necessary in their plans. It is up to the individual concerns that go to sell you goods to decide whether they should affiliate with the National Association. We would like to see them belong, but, of course, that is a question for each and every individual to decide. And every one of the houses in the West have had the chance and

Better Mix at Lower Cost

36 in. Vacuum Condensing Unit, capacity 185 gallons finished mix per hour. Floor space 8x10 ft., 11 ft. high

A better flavored product.

opportunity to affiliate with us. We would like to see them join with us, if possible.

The President: I understand Mr. Hightower's suggestion was that we give an expression as to the wisdom or desirability of this Association, the Supply Men's Association, associating with the National Supply Men's Association.

Mr. McFarland: That question has not come forward from the Association of Ice Cream Supply Men, and it is the Western Association that is to be formed, and it is something outside of the National Association of Ice Cream Supply Men.

Mr. Hightower: The supply men of the State of California are contemplating organizing such an organization, and it is their intention to affiliate, as I understand, with the National Supply Men, but some of the concerns don't think the Ice Cream Supply Men's Association is worth while.

The President: Is that proposal to organize themselves different from the Association of Ice Cream Supply Men that these gentlemen are representing here?

Mr. Hightower: As I understand it, Mr. President, the supply men of the Pacific Coast in the state of California cannot very well belong as active members, because they only sell goods in this state. But the majority of them want to organize such an association in the state of California. There are a few in the minority, however, and they don't think the ice cream manufacturer regards it as of any importance that they should have and belong to such an organization and be affiliated with the National Association. And I think we want these people organized to the extent that they won't misrepresent any of the products that they sell us.

The President: What is the wish of the supply men here represented, as to whether that movement to organize that other Association is in their interest and they want it done or they do not want it done? I either haven't got the point or else I can't see where there is anything tangible for us to take hold of.

Mr. Henderson: Mr. Carver, this was the only idea that came up in our minds, that the only practical fact would be from the social end of it, to work in conjunction with the manufacturers in their conventions, to boost their conventions and to boost the social life of the conventions. There may be things come up, like the standardization of brick moulds, and things of that kind, that would be of real advantage to both sides. But in a meeting of this kind, and we had our experience last night, where twenty-one firms contributed to that entertainment, there is shown to be much less of a getting-together on the part of the supply men than there ought to have been. There should have been fifty there, fifty who are selling to you. We looked at it that if we could form a local organization of supply men that would work in conjunction with the manufacturers from the social end of these conventions only, that we might be of assistance in that way, not only to ourselves but to the manufacturer. It was just spoken of incidentally to-day, and we did not know how far the manufacturers would want to go along the lines of doing together the social features of conventions. So far as the National Association is concerned, they are doing that in a national way. Of course they could not come here locally and do that—we have to do it locally. If the manufacturers do wish to continue doing the social features of the convention, then it seems to me that if the manufacturers would help us as a local association, we would get

further in that line of work. That is the only place in which I can see that it would be of very much value.

The President: Gentlemen of the Convention, you have heard this explanation, Mr. Henderson states it clearly. What is your pleasure in the matter? Let us give the matter whatever action or attention it needs.

Mr. Platt: I move that it be laid on the table for future consideration, Mr. Chairman.

(The motion was seconded from the floor).

The President: Any discussion of the motion? If not, all in favor of it, make it known by saying aye. Opposed, no. That is not a very satisfactory vote, gentlemen. I will be very glad to hold that open. There should be a real vote on it one way or the other. There were only about two vots in the affirmative and no negative votes. I think there is no question about the feeling of the ice cream people towards the supply men and an appreciation of the advantage and pleasure that they have gotten out of the social end of the work so far at the different conventions. I believe we shall continue to enjoy that, and I think if our membership properly understood what is contemplated, they would not hesitate to express themselves more than they have. I confess that I did not get the point that was being driven at until Mr. Henderson's explanation, and yet the Chair is powerless in the matter, and we will have to pass on to the next order of business.

Under "Reports of Committees" we have several committees to report. First is the Auditing Committee, of which Mr. Hightower is chairman. Is the Committee ready to report?

Mr. Hightower: Mr. President, the Auditing Committee finds the Secretary's books in excellent shape, and his report as read yesterday correct.

The President: Then if there be no objection, the report of the Auditing Committee will be adopted and the report of the Secretary approved. Hearing none, it is so ordered.

The next committee to report is the Committee on Abuses in the Service—Mr. K. S. Carver, Chairman.

Mr. K. S. Carver: The Committee on Cabinets and Abuses of Service makes the following recommendations:

1. That our Association should go on record as being emphatically opposed to the common practice of furnishing fresh ice to dealers for other purposes than that of packing ice cream, and should recommend that this practice be discontinued and also that information regarding whatever action we take be properly conveyed to the ice manufacturer's association.

2. That every effort be used by the members of our association to push and develop the sales of brick ice cream, thereby giving dealers their desired variety of special flavors other than vanilla, which may be sold at a profit at least equal to that of bulk ice cream, and at the same time reducing the number of cabinet holes that are necessary in carrying a wide assortment of bulk flavors in stock.

3. That members of the association discontinue as soon as practical the use of one-gallon and two-gallon ice cream cans in connection with wholesale cabinet service trade.

4. That our association encourage standardization on cabinets of five-gallon capacity, it being our belief that it is practically as economical and efficient to pack three-gallon cans in five-gallon cabinets as it is to pack them in those of three-gallon capacity. At the same time this practice will afford an opportunity to carry more ice cream in stock at our dealers' stores in summer time without having to install additional cabinet capacity.

I might say, in addition to that, discussion about the cabinet rental and cabinet sale was not looked on with very great favor by the Committee. Such policies are not in practice by the ice cream industry at large, and we felt, too, that such a policy would tend to perhaps irritate the dealer—that it would be better to sell him his ice cream at one price and then make the price so as to cover some of those abuses that might creep in. We recognize the abuses, but it is a pretty hard thing to straighten out over the whole state. We can probably accomplish more by a little closer co-operation in each community, and if you find that your customers are using too many cabinets, bring your own pressure to bear on them as you see fit. We thought it was going a good ways to suggest the addition of a cabinet rental, without having the opportunity to discuss the matter more thoroughly than we have an opportunity to do at this time in the program.

The President: You have heard the report of the Committee on Cabinets and Abuses of Service.? What shall be done with it?

Mr. Hage: I move the recommendations be adopted as read.

The President: Does the mover mean that the recommendation be adopted as the practice of this Association?

Mr. Hage: Yes.

Mr. Wilson: I second the motion.

The President: Gentlemen, you have heard the motion, which is that the recommendation as contained in the report as read be adopted by the Association. That means just what it says, and I hope we appreciate that — that we are going to adopt some good strong recommendations, and that if any of us are not already working in harmony with them, that we will adopt that as uniform practice in our service, which will probably help us to bring a little more team-work into the industry. I am inclined to think we might have gone a little further and laid down some additional rules. But if we can make progress from time to time, as we can by action on one, two, three, or four of these abuses, we are doing great work, and it will only take a few years when we will have removed a great deal of the difficulty.

Mr. Goode: Would it be appropriate to suggest that the Secretary send each of us a copy of that?

The President: That is a good suggestion. And that will be understood as part of the motion, that the Secretary be instructed to mail a copy of this to every member of the Association, unless the mover, or the second, objects. I hear no objection, and it will be so understood. All in favor of the motion will make it known by saying aye. Opposed, no. The motion prevails.

I had hoped we would have a report of the scoring of samples, but it is not yet ready. We will finish the other committee reports. There is a Committee on Uniform Price and Price Basis, of which Mr. Platt is chairman. Are you ready to report?

Mr. Platt: The committee found that the prevailing differences in prices did not exist as was supposed in the morning's discussion, and their findings are also that at the present time the committee would not recommend any change in the prevailing prices. But if the general slump in prices in all food commodities expected to come does arrive, the committee believes that by March 1st, if necessary, it would be advisable to drop the price of bulk ice cream to $1.40, and flavors

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

to $1.50, and, while they do not recommend, they wish to report that brick ice cream in the northern part of the state seems to be selling for thirty cents over the bulk prices, while in the southern part of the state it is selling for twenty-five cents, a discrepancy that possibly should be adjusted by recommendation or resolution of the Association. The general recommendation of the committee seems to be that what inequality existed in one section in wages and other factors that enter into the cost of producing and handling ice cream is offset by advantages in the other sections, so that it would be advisable for the industry to maintain a uniform price in all sections.

The President: You have heard the report of the Committee on Price. What is your pleasure, gentlemen? If no action is necessary on it, the report will be received and entered upon the minutes of the proceedings. It would be highly proper to take action upon it, if you feel so disposed, committing the Association to the recommendations of the committee.

Mr. Dorman: Mr. Chairman, I would like to ask Mr. Platt if he means by that that we are to have a uniform price for the San Joaquin Valley and San Francisco and Los Angeles, all places the same price, covering all the different points.

Mr. Platt: That seemed to be the conclusion of the committee, which was selected from different sections. The differences, just as we stated them, seemed to be that what was costing more in one section was offset by costs in another section, so that it would be perhaps practical and feasible.

The President: The point of difference between the brick price and the bulk price is a thing that could easily be made uniform.

Mr. Hightower: Mr. President, it seems to me that at this time there cannot be any definite action taken on a uniform state price, inasmuch as in the Fresno territory the price of ice cream is twenty cents a gallon less than the decrease proposed in the price, and in the face of other commodities going down, I don't see how we can raise it very well. So I am afraid we cannot conform to any recommendations of that kind now.

Mr. Platt: Unfortunately, gentlemen, we did not have any member of the Fresno section on the committee, and the reports from the various members that were selected by the Chair did not bring that fact out. Consequently there was no discussion of it. For that reason I think it is important for the Convention as a whole to take the matter up.

Mr. Hage: I was on the committee, and it was my understanding that our view was that they should get together as near as they could—I don't think we meant that Fresno should raise the price, but that they ought to stick while we are going down.

The President: I think Mr. Hage's suggestion is a practical one as a method of dealing with the subject. The report of the committee will be received and entered upon the minutes, and it affords a basis for us all in our action in the next month or two in dealing with this question of price.

We have two other committees to report, one on nominations and one on the place of meeting. The Nominating Committee's report will consist of a report and recommendations or nominations for the Board of Directors for the Association for the ensuing year. There is a matter that I am not sure in my recollection as to what the present status of it is, whether the Board of Directors should designate, at the same time they are selecting the officers for the ensuing year, a representative of this Association to serve on the Board of the National Association, or not,—whether that is done by the Board the same as officers are selected. I am inclined to think it is, and that that has been the precedent set in the past. So that, unless some one moves that a different action be taken, I shall assume that the correct practice is the practice that has existed heretofore. So I think perhaps we should hear the report of the Nominating Committee, and then the Committee on the Place of Meeting. Mr. Hage has already handed in to the Secretary the report of that committee.

Mr. Beaudry: The report is:

"The Nominating Committee report as follows: Directors for 1921: L. J. Christopher, S. A. W. Carver, C. J. Alfred, F. A. James, F. E. Miller, W. T. Vahlberg, R. J. Dryden, George E. Platt, H. R. Peacock, L. W. Wilson, W. B. Hage."

The President: This Board should hold a meeting this evening, following the adjournment of this session and before the banquet. I think there will be ample opportunity so that any action they may take in the selection of the officers for the ensuing year can be known before they separate for final adjournment at the banquet.

The next committee to report is the Committee on Place of Meeting next year. Mr. Chapman is the chairman of that committee.

Mr. Chapman: Mr. Chairman, the Committee on Place of Meeting for 1922 suggests San Diego. Mr. Hage, of San Diego, has very kindly invited the Convention to meet in San Diego, and promises us a very good time and several bull features, etc.—for January, 1922.

Mr. Hage: Mr. President, I do not want to take the Convention down there against the wishes of the members. If it is too far, don't be afraid to say so. It won't hurt my feelings in the least. I telegraphed to the Grant Hotel and they told me that they would be glad to take care of us, and they have convention rooms and will be glad to look after all of our wants, and will be more than glad to have you, if you think it is not too far out of the way.

The President: You have heard the report and recommendation of the committee on place of next Convention. What is your pleasure?

Mr. Wilson: Mr. Greene, Secretary of the California Dairy Council, forgot to make one announcement, and that is that they are going, have positively decided to hold the Pacific Coast Dairy Show at Stockton next November, and I don't know but what perhaps the ice cream men would want to hold their convention there at that time. He says it is going to be a big affair, and they are going to make it an annual event, a dairy show at which there will be stock and also machinery exhibits. There will be several conventions there at that time—the buttermakers and the milk men, etc.

Mr. W. F. Sperry: I would like to ask for information. Mr. Chairman, if the list of nominees for Directors as read was supposed to represent the names of those selected for Directors—I mean those recommended by the committee.

The President: Yes, for directors.

Mr. Sperry: By whom was that recommendation made—by the committee?

The President: By the committee, yes.

Mr. Sperry: May the list of the nominees be read again, please.

The Secretary repeated the names of the nominees.

Mr. Sperry: For information, I would like to ask why there is no repesentation on the Board from either

Stockton or Sacramento? It seems to me that about ninety per cent of that committee is from south of the Tehachapi.

Mr. Hage: That committee, if you notice it, has provided exactly the same Board that was on last year. Possibly there should have been a change, but nobody said anything about it. The only change was, I think, the addition of my name, and Mr. Trompas, a former director, had me put on in his place.

Mr. Sperry: I have only been in business for a little over a year. And last year when the State Convention was called, it came practically before I knew very much about it, and we were not members, and we were asked to become members, and it was suggested that members in the Sacramento Valley become members and we did so, and now we meet here and we put up a board of Directors and do not represent anything, you might say figuratively, north of the Mason and Dixon line.

The President: I think the gentleman is in error in assigning so large a proportion of the Board as being being north of Tehachapi.

Mr. Sperry: Perhaps I should say south of Stockton.

The President: An east and west line through Stockton would about pass through Oakland. But speaking of a division at the Tehachapi, the Board is as nearly evenly divided as can be—there are six on one side and five on the other, on a line drawn south of San Joaquin Valley.

Mr. Hosking: I think it would be no more than fair that somebody up north should be a director of this Association. You have three here in Oakland, and most of the rest of them were down south.

Mr. Sperry: Mr. Chairman, if this Association is going to be a success, it wants to have the support and co-operation of all the men throughout the State, and if you talk over the list of recommendations, you will find that certain interests are very largely represented on that Board.

Mr. Wilson: Bill Hosking and I organized this association a good many years ago, and this is the first time that we have ever had anyone take any interest in who was going to be a Director. I am certainly glad to see it. I move that nominations be thrown open to the floor, and that we nominate anyone desired, and then have a real election.

Mr. Hosking: I second the motion.

The President: The motion is made and seconded that the vote by which the Directors were chosen be reconsidered, if I understand the scope of it, and that the matter of nominations be placed before the Board. You have heard the motion. All in favor of the motion make it known by saying aye. Opposed, no. The motion prevails. The matter is now before the house.

Mr. Dorman: Mr. Chairman, I am having to leave, and I just want to say this, before you go back to the place of meeting, that in connection with the Northwest Association, they are very anxious to extend an invitation to us to meet with them next year, and you might want to consider it in deciding definitely as to your place of meeting. As I say, they are anxious to meet with us if we can arrange that sort of program, and it might influence you a little in your decision as to the place of meeting.

The President: A vote has already been taken on the place of meeting, but it can, of course, be reconsidered.

Mr. Hage: I think it was not voted on, Mr. Chair-

man. And, under the circumstances, I will withdraw in favor of Stockton, if they are going to pull a dairy show and want to hold it at the same time, especially if the Northwest people want to come down.

The President: Then I think the place of meeting should be left to the Board of Directors. I suggest that the committee make its report in the form of a recommendation that the place of meeting be referred to the Board of Directors.

Mr. Chapman: As a member of the committee, I make that recommendation, that it be left in the hands of the Board of Directors.

(The motion was seconded from the floor.)

The President: All in favor of referring the matter of the place of meeting next convention time to the Board of Directors will say aye. Opposed, no. The action prevailed.

Thereupon Messrs. S. A. W. Carver, I. J. Traynor, W. T. Vahlberg, Charles M. O'Brien, D. J. Alfred, Geo. E. Platt, F. A. James, W. B. Hage, H. R. Peacock, L. W. Wilson, J. M. Contraras, T. W. Hightower, Jr., L. J. Christopher, and R. J. Dryden were placed in nomination from the floor for members of the Board of Directors for the ensuing year.

The President: The Secretary will prepare ballots and distribute to each member, and the members will write in the names of those candidates for whom they vote. Only active members can vote. Tellers must be appointed.

Mr. Hosking: Are nominations closed?

Mr. Miller: I think, Mr. Chairman, we have not formally closed the nominations.

The President: No, they have not been closed formally.

Mr. Hosking: I would like to nominate Mr. T. Mogansen, of the Fairy Ice Cream Company, of San Francisco.

Mr. Hightower: I now move that the nominations be closed.

(The motion was seconded from the floor and unanimously prevailed.)

The President: I will ask Mr. Chapman and Mr. Hightower to act as tellers. (The tellers announced the result of the ballot to be that the following gentlemen were elected as directors: Messrs. Carver, Traynor, Alfred, Platt, Ames, Peacock, Wilson, Hage, Contreras, Christopher, Dryden.)

The President: The scoring of the exhibits of ice cream is all completed except in two respects, the fat analysis and total solids, so that we cannot give you the final report at this time. And it has been decided that it would be better that whatever announcement we can make, if the matter is before us completely this evening, can be made at the banquet. There will be something to say also regarding plans for another year on this matter of scoring.

Mr. Goode wishes to say a word concerning the Arizona Association.

Mr. Goode: Mr. President and Gentlemen: On behalf of the Arizona Ice Cream Manufacturers' Association, of which I became a member while I was down there, I have beeen asked to invite all of the California ice cream manufacturers to attend their association meeting, to be held in Tucson on the 20th and 21st of this month. I happened to be making a trip down there last Thursday, and this matter was communicated to me, and I know they will show you a good time if any of you can go. The little town of Tucson is worth visit-

ing, and they have a number of places to show you, and they are very much interested in us and in having us there. They extend a hearty invitation to attend the meeting on the 20th and 21st of this month.

Mr. Platt: Mr. Secretary, I would like to ask if the sectional representation is fair as the Board now stands. If not, I would like to withdraw, to have the condition of the Association in the best possible form.

The President: The south has five and north of Tehachapi six.

The Secretary: Four from Los Angeles, one from San Francisco, one from Bakersfield, one from Fresno, one from San Diego, one from Phoenix, Arizona, and one from Oakland.

The President: It would seem to be three from the Bay District, three from the Valley, four from Los Angeles, and one from San Diego.

Mr. Platt: I think, Mr. Chairman, to have the thing properly balanced, it would be advisable to have Mr. Miller, of Oakland, on the directorate in my place. I would, therefore, like to withdraw in his favor, if that be permissible.

Mr. Miller: We could not do it in that way any way, and Mr. Platt is more than generous. I think it is a very fair division the other way, and Oakland is represented and ably so. I am one of the kind who is going to be a front-seater in every convention, and right there all the time anyway. And you stay there, because we want your experience.

The President: The attitude that both of these gentlemen take is commendable, but the body has spoken and made its decision, and while it would be eminently pleasant to the Chair either way, I hardly think that it ought to be insisted on, although I would be very glad to see Mr. Miller a member of the Board.

Mr. Miller: I insist that the election go this way, and I think we can show Mr. Platt that all districts are represented.

Mr. Sperry: I approve the way it stands.

The Chairman: I think there is nothing else before the Convention. I will ask the members of the new Board of Directors to meet informally, at least, before the banquet. If there is no objection, I will now declare the Convention adjourned.

WISCONSIN ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from Page 10)

tain they would have to collect the tax. If not served from the soda fountain, but from the kitchen, they did not have to pay the tax. You can see the difference between the table de'hote meal and the plate meal. How were they going to tell when they should charge one price? One meal would include ice cream. So the Department has just issued a letter which definitely says where a bona fide restaurant or hotel sells a plate meal, not a la carte meal, where it is sold separately, even though they sold it from the soda fountain they are not required to collect the tax. That is simple and plain. If that restaurant or hotel has an a la carte meal and they sell from their soda fountain in their place of business, then they are supposed to collect the tax for which that particular ice cream is sold.

As far as taxable sales are concerned we can say generally, outside of those three exempt cases ice cream is to be taxed when sold at soda fountain or similar place of business.

Our office noticed an article published in bulletins in Detroit, in which they quoted a Treasury decision to the effect that ice cream cones would not be taxable when they were not sold at the ice cream parlor. Evidently they misunderstood the office on that, because ice cream cones are taxable. It does not make any difference whether you sell it from an ice cream parlor or from a hotel, the ice cream cone is taxable and the tax is based on 1 cent for each 10 cents or fraction thereof, even though the people buy three or four ice cream cones and carry them with them.

Lots of ice cream parlors are located in buildings. People go down there at noon to get a luncheon. They buy ice cream sodas, and possibly a sandwich along with it. That sale is taxable even though there is a sale of food with it.

I will say further in regard to hotels or restaurants which serve regular meals with ice cream included, supposing during the day those hotels serve ice cream in separate dishes outside of their meal time entirely, they are subject to collect the tax even though they serve it from the kitchen.

Remember this tax as it stands to-day is paid by the consumer. The dealer's responsibility is to collect that tax and report it and pay it to the United States government. Under the law they are supposed to keep records of the amount of money they collect, and those records must show daily the number of sales they make, the number of sales where there is a 1 cent tax, a 2 cent and a 3 cent and so on, and those records must be kept available for an Internal Revenue officer. The larger places are handling this tax correctly. They can afford to take care of it and their overhead covers it, but the smaller dealer, perhaps he doesn't understand books, it is hard for him to keep books, and there is where the difficulty comes in. You can see on the other hand how it is possible for anybody who desires to violate this law and to be crooked, they can do it and it means that much more work for us.

It has always been the feeling of the Internal Revenue officers in the field in enforcing this tax that it should be a tax on the sale by the manufacturer rather than the sale by the dealer. I feel sure there is not a manufacturer in this room but would not rather handle it that way because he can do it. He has books of account and he can pass the tax on to the dealer and the dealer would rather have it that way and the public would rather have it. The question is whether or not the taxing of the manufacturer himself by the excise tax would not conflict with the pure food laws. There are heavy penalties. It is true any dealer who does not collect this tax, the Internal Revenue department or the government cannot force him to pay the tax he has not collected because he is not supposed to pay that tax. The Internal Revenue department in enforcing this tax has to resort to the other penalty. There is a penalty that says for every failure to collect a tax on the sale of ice cream, where it is wilfully refused, there may be a fine to about $1,000. If he fail to collect it six times in the day he would be liable to prosecution under that section which says he should collect that tax on each separate transaction, and the penalty runs up to $10,000.

That is the way the ice cream tax is on the statute. We do not know what Congress will do with it. Some change should be made in the tax and I have no doubt Congress will do it, but until Congress does we, the Internal Revenue collectors in this country and in this state, have to see that the people are living up to it. Until that time it is the intention of this department to enforce the collection in every case that comes to our notice of failure to collect the tax.

I have spoken to you this morning as a representative of the Internal Revenue Service. Your secretary asked Mr. Williams to send somebody over to talk to you and made this request two months ago. As you know, Mr. Williams is leaving the Service to act with his associates in advising the banks and their clients on all lines of tax matters, and Mr. Williams saw fit to ask me to go with him, and as a result of the fact that his resignation takes effect immediately my resignation took effect last evening, but I felt I could come over and talk to you this morning as a representative of the government, that I still have interest in the Service, although, technically, I was out at midnight last night.

If there are any questions you would like to ask, I would be very glad indeed to tell you anything I know.

Member: I would like to ask a question in connection with a hotel or restaurant serving a la carte meals, in case where they have a packer cabinet apart from the fountain?

Mr. Sprague: If that cream is served either separately or by a la carte meals, the cream from this separate packer cabinet would not be taxable. I mean by that a cabinet that is away from their soda fountain and not a part of the soda fountain. We do know if it is served from the kitchen it is not, but due to the fact that this ruling came through in regard to a la carte sales I believe the tendency of the Department would be not to tax that sale even though it was an a la carte meal.

Chairman: The next number on the program is "Ice Cream in the Diet for Children," by Mrs. Frances Donovan, of the Elizabeth McCormick Memorial Fund, Chicago, illustrated by stereopticon views.

* * *

ICE CREAM IN THE DIET FOR CHILDREN.

By Mrs. Frances Donovan, Chicago.

Mr. Chairman, Gentlemen: It is with considerable trepidation that a mere woman breaks into this meeting, but, as perhaps you realized in inviting me, it is fast becoming the fashion, in fact, it is almost compulsory, to include women in conventions and deliberations of all kinds. Since we women have been given our political rights and privileges, with their corresponding responsibilities, (which the men have borne so long and so cheerfully alone) I suppose it is but a sign of the new order that you should include a

woman speaker on the program of the Ice Cream Manufacturers' Convention.

I am, of course, ignorant of the details of your business, and I am not here to suggest any startling innovation in your manufacturing processes to advocate changes in the relations between you and your dealers, but I do come to say a word for the ulitmate consumer, and I am going to say it as a friend of the children. There is no question about the appetite for ice cream in America, but I hope to be able to suggest to you, that you have not as yet fully measured the capacity of the American child and of his parents for ice cream, nor yet given the public all the reasons for the purchase and consumption of your product. If I am able to furnish you with any "talking points" in your advertising program, I shall be very happy indeed and feel that it will not have been entirely a matter of courtesy that you have placed a woman on your program.

I have the pleasure of coming before you to-day as the Director of the Elizabeth McCormick Memorial Fund, a foundation established by Mr. and Mrs. Cyrus Hall McCormick in memory of their daughter, and devoted to improving the conditions of child life in the United States. The Fund has been, so far, chiefly devoted to promoting the health of children, because that is the field that has been most generally neglected. To further this purpose the Memorial Fund has been carrying on open air schools in Chicago, for the past twelve years, to benefit children who might otherwise become the victims of tuberculosis. It was also, during the past year, developed nutrition classes for underweight children in the public schools and elsewhere. The open air schools and the health classes are, of course, largely concerned with the diet of the child, and one of the things that we wish to show in our work is what results we can obtain in the improved health of children through proper feeding. Knowing, as you do, the vital properties of milk and all milk products for the human family, it is hardly necessary to say that we stress the use of milk, butter, ice cream and cheese, in all of the work. During the past two years, we have had the cordial co-operation of the National Dairy Council, and, during the past year, of the Milk Dealers' Association of Chicago. Through the Dairy Council we have had opportunities to show the value of correct feeding, including the use of milk, for children, and have prepared educational exhibits for the National Dairy Show showing almost miraculous changes in undernourished children, who have been given a quart of milk a day. The milk dealers have also been generous in giving us an allowance of milk for your health classes, so that we might teach the parents, through experience in the improved health of their children, the value of milk in the diet of the family.

This talk of health and the welfare of children seems almost to fill the air to-day, and yet until now both have been seriously neglected in our national life. The children of America are said to be more indulged (perhaps over-indulged) and more tenderly regarded by their parents than the children of any other nation on earth, but these same children have on the whole been more intelligently treated than those of almost any civilized country. We are seventh down the list of civilized nations in the death rate of our children, each year losing almost half a million of them under six years old. In this rich and progressive country we have been singularly blind to the fact that if we build without health as the foundation of our national existence we are but building upon sand and with small possibility of future greatness. We were, however,,

DIRECTORS OF DISTRIBUTION

JOHN W. LADD COMPANY
Detroit, Mich. Cleveland, Ohio

CHERRY-BASSETT COMPANY
Baltimore, Md. Philadelphia, Pa.

Tell your friends and neighbors you are going to the World's Greatest Dairy Show, Minnesota Fair Grounds, October 8-15, 1921.

aroused from our complacent attitude in regard to our disgracefully lage toll of child life paid each year, and the general neglect of health, by the findings of our draft boards during the war. For the first time the youth of our nation was put through an acid test for physical fitness, with the result that over one-third of ouryoung men were rejected as not capable of sharing in the defense of the nation in her hour of need. It was proved, moreover, that most of these rejected men were suffering from difficulties and defects which could have been remedied hay they been recognized in childhood. The discoveries made through the physical examinations for army service were reinforced by extended surveys and studies made during the past few years, which showed that about 70 per cent of all our school children are suffering from physical handicaps that impede their progress to a greater or less degree, while from one-third to one-half of our school children are under weight and under nourished. It is evident, therefore, that the work of promoting the health of children is a movement vital to the future efficiency and welfare of our nation. You may feel that a health program is a far cry from the marketing of your product, but let me remind you, in the first place, that the promotion of health among your own employes, for instance, would be one of the soundest investments that you could make. If each of you had a corps of men and women working in your plants, all of whom come to their work with joy in the morning, and left it with "pep" at night, who had health equal to any emergency or unexpected strain upon them, you would certainly not have so large a labor turn-over, so many losses from inefficiency, and you would have a stable instead of an unstable quantity to deal with in considering the output of your establishment. In the second place, you are manufacturing a product which is one form of a food absolutely indispensable to the human race. Dr. McCollom and others have proved that man cannot reach his full stature, nor his full measure of physical usefulness, if he is not given milk products in some form. Therefore, your advertising might well be based upon the sound appeal to health, an appeal to which no mother interested in the welfare of her children could afford to turn a deaf ear.

I should like to state at once that the program in the nutrition classes we have carried on in Chicago, as well as in the open air schools, is educational in every sense of the word. It has been shown that as many children in our well-to-do-ditsricts are underweight and under-nourished as in the poorer neighorhoods, proving in every survey that has been made that the problem is not one of poverty, but of ignorance. Our methods, therefore, are bound to be educational and not philanthropic. We are not promoting a program of free feeding of school children, but are teaching the value of proper food in health building and giving such training in health habits as will lead to a future of full productivity efficiency and happiness. It is our idea that health through correct feeding and proper living can be taught just as easily and successfully as arithmetic, reading, geography and history, and through methods as simple and as practical as those with which we are now familiar in our schools. The ignorance in regard to the properties of food is so wide-spread that you could not do a finer service, not only for the promotion of your own industry, but for your community and your nation than to spread as widely as possible the knowledge of food values and of what constitutes a good diet for a child, whether he be rich or poor.

(To be continued in September issue)

A DAIRY INSTITUTE, CONDUCTED BY THE NATIONAL DAIRY COUNCIL.

The city and county milk and dairy products campaign has shown itself so vital and so helpful that a great demand has arisen for it in all parts of the country. The demand upon the National Dairy Council for this class of educational and promotion work is so great that we found it necessary to train a corps of workers to send out into different cities and counties beginning early in September, for the organization of educational school work necessary for the proper conduct of these campaigns.

The management of the Council from experience, reached the conclusion that to do this form of educational work properly it must be well founded, efficiently organized and directed, and given so much life and direction that it would keep moving for years to come. This makes it absolutely necessary to have experienced workers trained to see and develop every resource of the community where these campaigns are conducted with this fundamental idea in mind.

In order to have such workers, the National Dairy Council has brought together a force of twelve women already highly trained in organization work, and is giving them a three weeks' course of intensive training along the lines of the work being done by the Council—its methods of conducting campaigns, together with a broader understanding of the proper relationship of milk and its products to nutrition. This three weeks' course in addition to the training under the direction of the Council itself, includes an intensified course of nutrition training in relation to dairy products with the McCormick Memorial Fund organization. In addition to this, these workers, with an instructor familiar with the plan of procedure of the manufacturing and handling of products, were taken through milk plants, butter and cheese plants, and machinery plants.

We have brought to this course a corps of young women who are already engaged in community, domestic and dairy science work. They are all college and university graduates with experience along dairy extension line, urban and rural, home demonstrtaion work, and in some cases, Red Cross and nutrition work. Based upon this background, we are giving them a broadened idea and understanding of the dairy industry and its vital relationship to human and national welfare.

These workers will be ready to enter upon the campaign work which the National Dairy Council has already been called upon to perform, opening up in September.

NATIONAL DAIRY COUNCIL,
Publicity Department.

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION.

To Members Pacific Ice Cream Manufacturers' Assn.:

Having made a canvass of the Board of Directors of the Association as to the city in which to hold our 1921 meeting, and the dates for the same, the vote is very much in favor of Seattle as the first choice, with the tentative dates of Nov. 14, 15 and 16.

The Executive Committee has decided the convention will be held in Seattle, Washington, on the above dates, at the same time asking that the Directors make it a point to be in Seattle on Sunday, the 13th, in order that a business meeting may be called before the regular session opens on Monday morning.

Your Program Committee will greatly appreciate your suggestions for Convention papers, giving the

"With the Tang of the Berry Patch"

topic you would like to have taken up, also as to whom you think would be the best speaker to handle your particular subject.

We hope to make this meeting just a little better than former ones and to do this we are asking for the co-operation of all the members; there are a number of questions coming up each season in which you are vitally interested. We know what ours are, but will not be able to bring out YOUR particular one unless you advise the Secretary. Kindly do this at your earliest convenience for it requires time to arrange a complete program.

You will be notified later as to the Seattle headquarters and the committees having the different matters in charge. We will advise you of the different hotels and rates in the near future.

Anyone who has attended a Pacific Association Convention will be anxious to attend this one. We are going to maintain our reputation, and ask that every member help to make this the banner Convention.

PACIFIC ICE CREAM MANUFACTURERS' ASSN.
J. E. Dunne, President. Bert H. Walker, Sec'y.

CRUCES CANDY AND BOTTLING COMPANY INCORPORATES.

Cruces Candy and Bottling Company, of Las Cruces, New Mexico, has been incorporated under the laws of New Mexico, with a nominal capitalization of $25,000, no stockholders' liability. The incorporators are: E. T. Winters, J. B. Camunez and C. O. Bennett, of Las Cruces, where the company has two retail stores, and ice cream and candy factory and a bottling plant.

The certificate of incorporation, issued by the State Corporation Commission of New Mexico gives the company permission to establish and carry on all or any part of the business of manufacturing, importing, buying and selling either as wholesale or retail merchants, or both, of candy, ice cream, cigars, cigarettes, tobaccos, smokers' supplies, flavoring extracts, flavors, syrups, soda water, and all other soft drinks and all machines, parts, supplies and accessories used in and about an ice cream and soda water fountain and candy factory.

The company also is permitted to import, manufacture, deal in and transport ice and to manufacture, buy and sell all kinds of ice machines or apparatus and refrigeratory plants and processes, and to establish and carry on, either as wholesale or retail merchants, or both, all and any part of the business of a bottling plant, and to manufacture soda water and all soft drinks, extracts, flavors, vinegar, bluing, toilet lotions, toilet articles, medical preparations of all kinds, drugs, chemicals for medical use and to establish and operate, buy or sell all kinds of bottling machines and accessories.

Mr. Bennett, who is manager of the company, which is incorporated for a period of 50 years, said present plans are to do a yearly business of from $100,000 to $125,000. It is expected to increase the capital to $50,000 or $75,000 within the next two years.

F. H. BOTHELL RESIGNS

F. H. Bothell, for many years superintendent of manufacturing at the Crescent Creamery Company, Los Angeles, severed his connection with that company July 15th, to enter business in Los Angeles, where he will make and sell ice cream only at retail. His technical knowledge of ice cream manufacturing in solving many of its problems is recognized throughout the country.

FROM MEXICO.

Throwing the bull is a particularly fascinating sport, both indoor and out, for the denizens of Mexico. Strangely enough, however, despite the fact that the diversion originated in Spain, eons and eons ago, and has ever since been perpetuated by persons of Castilian extraction, as a pastime, its exponents are not confined to either Spain or Mexico for that matter. On the contrary this specie of individuals can be found browsing in almost every quarter of the globe, And they can 'throw the bull' in any language spoken, written, gurgled or slaughtered without so much as wrenching an eye-lash.

Oh! yes, the world is full of toreodors, matadors and cuspidors. But what we started out to say was this:

The Olsen Publishing Company desires to make public acknowledgement of the receipt of a postcard from C. P. Hostetter from "Somewhere in Mexico." He selected for our particular delectation and amusement a card depicting a gory bull about to receive the coup de grace from a courageous toreodor, or is it matador (our knowledge of bull-baiting is very restricted.)

For the benefit of those who arrived late we will pause long enough to say that the author and sender of the Mexican epistle is the district manager of the J. B. Ford Co., at Atlanta, Ga. There was nothing on the card to indicate what C. P. was or is or should be doing down there. The natural inference is, however, that he is in pursuit of business for Chief Wyandotte. Naturally, being a Dixie Flyer gives one a great deal of latitude in both business and pleasure, so it is more than probable that when he returns from the land of chili con carne, hot tomales, lizards, Villistas and siestas, he will bring with him a new interpretation of the Spanish fandango or Mexican Misstep, acquired from some bewitching and dark-eyed senorita, who no doubt found him a most apt and ambitious pupil.

This, of course, is only conjectural, dear readers, but—knowing a little about the propensities and personality of the subject of this harangue, it is better than a 10 to 1 shot (in the elbow) that he is capable of all that has been intimated and then considerable more.

Now all this has nothing to do with throwing the bull—you say. Well, that's just where you are about four inches out of plumb. What do you call all this stuff that you have been wading through to get this far? And it was all inspired by a postcard from loco land that cost about 2 pesos or ½ of 1 per cent in Uncle Sam's coin of the realm. Don't make any boisterous threats to shoot us at sunrise. We positively refuse to arise that early.

* * *

J. W. Mulligan, ex-president of the Dixie Flyers, who keeps his finger pretty tightly placed on the pulse of this organization apparently is not altogether pleased with the manner in which his colleagues have failed to avail themselves of an opportunity to use these columns in which to ventilate their views and divulge news items gleaned during their trade seeking peregrinations, as is evidenced by his communication which follows:

"I was surprised to see the June issue of The Ice Cream Review void of any communications from our members. While we all readily admit that the weather has been extremely hot that is no excuse to let our department go by default. Write something. Don't be afraid that you will be criticised. That's what we want from the members—good, honest criticism.

"Now I want to say a word about the good work of the Association of Ice Cream Supply Men. I don't see how a concern in the manufacturing line can afford not to be a member. I for one can attest to the good benefits I have derived from my membership, and I am sure it has been lots of help to others of the boys. So keep up the good work and get more firms to join the association. They need the information, and when they begin to realize the amount of co-operation they will get and how hard our Secretary, Rob Evert, is working to keep all of us posted I believe a great many more firms can be brought into the organization. I am convinced that none of the boys is a slacker, and by January, 1922, we should have a nice increase.

"With regard to trade conditions in general. I have found that the ice cream manufacturer is optimistic over his business and is looking forward to a windup of an exceptionally good year.

"We have been hearing so much of late about the revenue tax on ice cream in its various forms and so much talk that doesn't get us anywhere, particularly with reference to bringing about a repeal of the tax on cones, sodas and sundaes that I believe it is high time concerted action was taken by those identified with the various phases of the industry to get some definite action along the desired lines. Let us all get together on a solid front and bring so much pressure to bear upon our representatives in Congress that the tax on ice cream will be repealed and the kiddies will be permitted to have their wholesome food at a fair price."

In conclusion let me say that I was very glad to see Mrs. Harris' communication from New Orleans. However, I think it was so warm she left off some of "iLttle Bill". Won't you please write some more? I want to ask some of the rest of the boys to write something for our department. Even if it is too late for that month's issue of The Review it will appear the following month. So keep up the column, boys, and boost The Ice Cream Review.

* * *

Just by way of having something a little different in our department it occurred to me that the various definitions of "What is a Kiss," might prove interest-

Diamond-F

ing, especially to the Dixie Flyers, who have found the art of osculation a pleasant occupation. So here you are, boys:

WHAT IS A KISS?

A kiss is the twenty-seventh letter of the alphabet—the love liable—the limping consonant which it takes two to speak plainly.

OTHER BRIGHT DEFINITIONS.

A trust.
Free Trade.
A lip collision.
Self-surrender.
Execution proof.
A happy collision.
A bunch of tulips.
Love's reciprocity.
Heaven's electricity.
To salute with the lips.
A matter of discretion.
The only flower of love.
The key to the situation.
A night blooming serious.
The thrill of love's touch.
A report at headquarters.
An exchange of infirmities.
Nothing divided between two.
A lip tickle—round, all round.
A hyphen between two friends.
An inexpressible all overishness.
The ecstacy of angelic possession.
The acme of agony to a bashful man.
An exchange which is never below par.
Condensed animal and soul magnetism.
A meeting at the gateway of two hearts.
A feather dropped from the wing of love.
Woman's trump card in the game of love.
The only "smack" that will calm a storm.
Joy of the heart pressed through the lips.
Of no use to one, but much prized by two.
The food by which the flame of love is fed.
The only agreeable two faced action.
The door that opens the citadel of the heart.
Affords less pleasure than it begets mischief.
Good for nothing unless shared with another.
The drop that runneth over when the cup is full.
Operators working on the sounding board of love.
A draught of sweet nectar from the well of love.
A premium on love that all are expected to pay.
It grants forgiveness and occasions repentance.
It is like the wind that blows—felt, but not seen.
Something which requires two to make a good one.

Rather a warm dispute has been in progress between the Collector of the Port of New York and a firm of Japanese importers over the classification of frog skins. The collector held they were dutiable as leather, while the importers insisted that they should be classified as fish skins. Some time ago the Treasury Department experts decided that frogs legs were dressed poultry, consequently it would seem that frog skins should pay duty under the beneficient provisions of the Dingley tariff as chicken feathers. young lady composed and which is not only good reading but which carries a good business appeal. Here it is:

PLEASE RETURN THE LIDS.

There was a little ICE CREAM can,
Her name was CAROLINE,
Packed in a tub of ice and salt
She did look very fine.
Her sides were bright, her lid was new,
The tub was painted green,
She left the "CAROLINA" Plant
Filled with the BEST ICE CREAM.

She left us on a southbound train,
Soon reached her destination
Where everybody called the CREAM
"The BEST in all creation."
But when the CREAM was quite all gone
'Twas time for her return,
(And now there comes the awful part—
It makes our anger burn.)

When ere you start to go outdoors
In weather, rain or shine,
You always like to wear your "lid"—
Well, so did CAROILNE.
But, Oh! Alas, and also Woe!
Her lid was left, forgot,
The little can must go without,
And, gee, but it was hot!

The wait on the expressman's truck,
The long, cinder-y ride,
A night spent in the transfer
And another trip besides.
Sweet Home, at last, dear C. I. C.
When reach the plant she did,
Her sides were bent, her tub was scarred,
And, oh! she had no lid!

She wept and wailed (and so did we)
To think her lid forgot,
We had to buy another, and
They cost an awful lot.
So next when one of our CREAM cans
A visit makes to you,
Please send it back all safe and sound,
AND SEND THE LID HOME TOO.

CAROLINA ICE CREAM CO.

Bill Thoden wrote us the other day, a nice letter, too,—for Bill. He is roaming the plains of Alabam in the interests of the **United** Chemical and Organic Products Company. We haven't him listed as a member of Indiana Wild Cats, or the California Gold Diggers, or the Alabama Coon Chasers, but will confer upon the Dixie Flyers the honor of bearing his communication in their column:

"Am enclosing herewith money order, for which please send me The Ice Cream Review until said money order wears out. I notice Dad Mulligan is again riding herd on the Dixie Flyers. It's sure not his fault or the fault of Ye Editor that we all don't come across with some news, as I know that both of the above gentlemen have been trying their hardest to "extract" some of the "cream" from the good "mixes" that crowd the brains of my fellow Flyers. I, too, would like to hear from some of the boys through your columns. I'll say the Old Man is some "agitator". I'm not a writer, but as you all have been crowding me, I am enclosing a few stories. Maybe you'll let up on me after you see my "batch".

Yours very truly,
WM. A. THODEN.

* * *

A colored doughboy was on guard for the first time. About 11 p. m. he heard someone approaching. "Halt! Who's dar?" he asked. "Officer of the Day!" came back the reply. "Advance!" said the sentry. The O. D. advanced a few steps when the guard again halted him. "Well," said the officer, "this is the second time you halted me. What are you going to do now?" "Never mind what I'se agoing to do," said the sentry, as he cocked his piece and brought it to bear on the officer, "my orders are to say halt three times, then SHOOT!"

* * *

A traveling man bought a quart of "monkey rum" in a Southern city. It was a brand that would separate one's soul from his body. He could not drink it, so he presented the bottle to the negro porter. Several days later he saw the porter and said, "Sam, how did you like that whiskey?" "Jes right, Suh!" said the negro. What do you mean by "just right?" asked the salesman. "Well, Captain," said Sam, "if it was any better you'd a drank it yo'self, and if it was any wusser it would have killed me. It was jes right, Suh, jes right!"

* * *

Lars Larson, a yokel, walked into a restaurant in a Wisconsin town and said to the owner, "You bane got some squirrel whiskey?" "No," replied that worthy, "but I can slip you a little Old Crow." "Aye don't vant to fly," said Lars, "Aye yust vant to yump around a little."

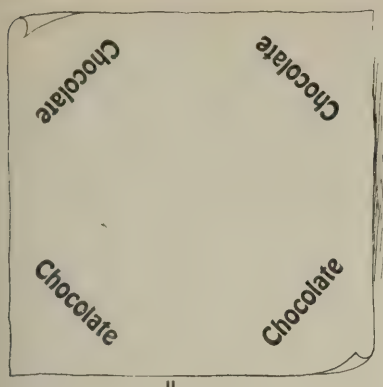
HOTEL INCONSISTENCES.

What is the matter with the hotels? Is there a tangible reason for charging war period rates, when practically every item that enters into the hotel expense has been reduced?

I have just finished a trip over a good portion of the South, and with the exception of one or two hotels, they continue to gouge, bleed, "double you up", in fact exercise every subterfuge and prerogative, practiced and utilized during the war.

There are some endeavoring to cover up their obnoxious game through the medium of advertising a 50 per cent reduction in rates, but upon investigation the 50 per cent reduction applied only to rooms where the rate was from $4 to $10.



Ex.-Vice-President Marshall said a short time ago that what the country needed was a good five-cent cigar. He should have gone a little farther and said what the traveling salesman needs is, a hotel with a comfortable room for $1.

For the last four years hotels have "waxed fat", they are still waxing fat. They have more than prospered, and, for the capital invested, paid greater dividends, I believe, than any industry catering to the general public. And now that they are using cheap labor, they cannot hide behind the cloak of high operating costs, as an excuse, for exacting a charge, out of all reason.

Arrogating to himself the privilege of charging rates as is collected by hotel men to-day, is not only getting from the public, more than it can afford to pay, but he is pocketing a fee, which if reduced, would, ununder present conditions, enable thousands of salesmen to resume their traveling positions.

The hotel man has had the lucky end of the game. He now has the chance to show his sporting proclivities, with those who made it possible for him to win.

Those salesmen who are still on the road are not making, by 50 per cent what they did a year ago, and 25 per cent of them traveling a year ago, cannot travel

K. V. P. "Indexed" Vegetable Parchment Can Tops

Avoid confusion in your hardening and storage rooms as you would in your office records. Filled cans in storage contain the definite record of a manufacturing process. You can

Systematize Your Hardening Room

with these handy K. V. P. "Indexed" can tops and do away with having employes fumble can covers to establish the identity of their contents.

Combination Sanitary Can Top and Can Label

Made of genuine vegetable parchment in the "World's Model Paper Mill." These K. V. P. "Indexed" can tops are absolutely sanitary. They protect the contents of your cans against contamination and reduce the necessity of washing lids.

Prominently printed on substantial vegetable parchment, these tops are not a flimsy article just for show or effect, but an honestly made, practical, sanitary can cover that is serviceable and supplies a great need at a very nominal cost.—Try Them.

So You May Know the super-excellence of K. V. P. Products, samples will gladly be sent on request.

Manufacturer

National Steam Pump Company, Upper Sandusky, Ohio

to day, because of the high cost of hotel bills and railroad fare.

Commercial salesmen are etnitled to a hotel rate and railroad fare that would leave them a fair return for their effort. The hotel man should recognize this fact, that the time has arrived when he should shoulder his part of the burden, and by so doing help return to the road thousands of salesmen who, through the present high hotel rates, he, in a great measure, helped off the road.

The greatest asset the hotel man has is the commercial salesman. His weekly, monthly, or yearly visit is the life blood, coursing through the arteries of the great hotels throughout the country.

He is the daily food that nourishes, stimulates and keeps them in a healthy condition. Without him they could not exist.

Mr. Hotelman, you have had your share—in abundance. Wake up to the situation.

Square Yourself—by making restitution to the salesmen, in the form of equitable rates.

Be Human—Be a Man! Just put yourself for a few minutes in the salesman's place; particularly the ones you have helped force off the road with your high priced rooms.

O. M. P.

SOUTHERN EXHIBITION.

Your last bulletin told you about the Southern Exhibition. The southern states form an empire in themselves, in size and natural resources. Georgia, for instance, is the largest state east of the Mississippi, and has mineral and agricultural assets that are a potential foundation for incalculable wealth. Georgia is just an example—the whole south is destined to have a miraculous development.

The Association's Southern Exhibition is an entering wedge to make sure that ice cream receives its due regard in this big and awakening section. Whether you travel in the south or not, you should know about this exhibition and talk about it too, for it means an impetus to the ice cream industry that will be directly felt in the section comprising 15 states and that indirectly will react for a stimulated industry nationally.

Remember once more—

1. It will be the first big display of manufacturing essentials ever held in and for the south.

2. It will be held in conjunction with the annual convention of the Southern Association of Ice Cream Manufacturers.

3. It will be as big and comprehensive an exhibition as the big Eastern Exhibitions of the Association of the last two years.

OKLAHOMA ASSOCIATION.

It would seem greater changes in policy have occured during this season than ever before and manufacturers are realizing that from now on the public demands they produce quality goods, and under highest possible sanitary conditions. Attendance at conventions, which represent a post graduate course to the industry, is essential to every progressive manufacturer who hopes to survive this re-organization period, and it is to be expected a good attendance will be had at the various meetings.

M. T. COCHRAN, Secretary.

THE DAIRY SHOW PRESENTS A UNITED FRONT.

By E. W. Chandler, Pres. The Creamery Pkg. Mfg. Co.

It is a matter of the keenest pleasure to those of us interested in the welfare of the great dairy industry to note with what unanimity the many diversified branches of the dairy industry are backing up the 1921 National Dairy Show and endeavoring to make it the greatest exposition that dairyland ever beheld.

It is apropos that such powerful organizations as the International Milk Dealers' Association, the National Association of Ice Cream Manufacturers, the various national pure breed cattle associations, the National Creamery Associations, and many others will hold conventions in the Twin Cities during the Dairy Show thus proving by their presence that they are united in a genuine desire to make the show the greatest ever held.

That these diversified interests can get together and co-operate to make the National Dairy Show a success is proof positive that they can unite on other worthy projects for the common good. If they will do so, the time is not far distant when newspapers and professional politicians will hesitate to persecute the industry and stir up the public for their own selfish interests; the time is not far distant when the public will be educated to the wonderful food and health-building value of dairy products; and when the farmer will be educated to know that a herd of milk cows is an anchor to windward—a producer of ready cash when crops are failures or underpriced.

If every man who is interested in the dairy industry will make it a point to attend one or more of the conventions in the Twin Cities during the 1921 National Dairy Show, and of course attend the show as well, he will not only be the richer by learning new or improved methods, but he will be doing his bit to boost the industry.

NEW SOUTHERN DEPARTMENT.

The Essex Gelatine Company, 40 No. Market St., Boston, Mass., manufacturers of a famous brand of gelatine, announce the appointment of Mr. John J. Treacy, of 6401 Ventnor Avenue, Ventnor City, N. J., as their representative in the South. Mr. Treacy will take direct charge of the marketing of Essex gelatine, south of the Mason-Dixie line. Essex is very well pleased with the reception Mr. Treacy has received so far in that territory. He has already done a very substantial business. Essex Gelatine Company in the future, will devote more energy to developing their trade in the Southern states.

FOR STORING CANS.

A subscriber to The Ice Cream Review writes that he is using corn oil for the purpose of greasing cans for winter storage. He is wondering whether any other preparation is giving satisfaction elsewhere. Your experiences would be appreciated. Send them to The Ice Cream Review, for publication.

NEW ICE CREAM PLANT IN IDAHO.

Emmet, Idaho.—Emmett has a new ice cream factory which has opened for business by Lyons & Rodandt in the new brick and concrete building built by H. D. Buys.

ICE CREAM INCREASE PHENOMENAL.

Supply Men's Association Finds Season's Heavy Business Pre-Determining Great Importance of this Year's Two Large Exhibitions.

That the increase in production of many plants throughout the counrty during July has been little less than phenomenal, all factors of the country's economic condition considered, is the report made to members bby The Association of Ice Cream Supply Men from information given to it by persons qualified to speak for many different sections in a printed bulletin issued August 15th.

After commenting on a slowly increasing stabilization of general business conditions, this official bulletin of the Association then says, in part:

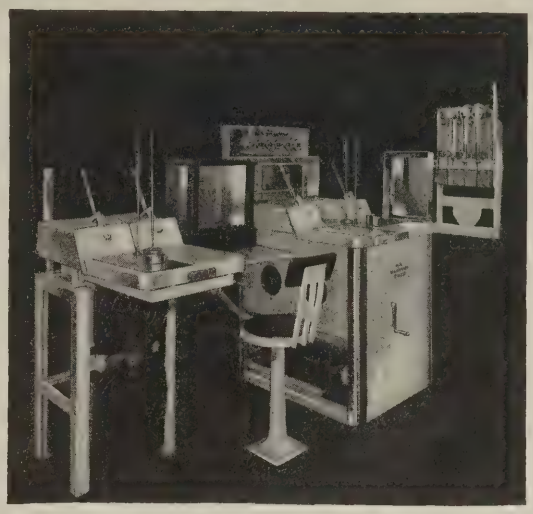
"That being a 'bear' on the ice cream industry is a losing proposition—as the most famous of speculators once said of being anything but a 'bull' on the United States—is pretty well proved by the evidences of this stabilization having thoroughly set in in the ice cream industry. Some plants are reliably reported to have increased production by more than 20 per cent in June and July, in spite of new and active competition. Despite a cold early summer and a general depression wide spread at that time, the gallonage produced to date undoubtedly totals a distinct advance from 1920.

"When, as an example is reported, a Connecticut crossroads country store keeper, six miles from a manufacturing city that has experienced for months plant shut down, and financial difficulties re-acting in the surrounding section, sells five gallons of ice cream, almost all in cones, in one day (and a small percentage only to passing tourists) there is no room for believing that either the latent demand for ice cream or its distribution methods have been exploited to anywhere near their maximum."

According to Oliver S. Jordan, President of the Association, the indicated continued increase in 1921 of the ice cream commercially produced in the country makes the two large exhibitions of supplies, equipment and machinery arranged for autumn of greater importance than any yet held for the benefit of the industry.

"The fact that the industry is continuing to increase production this year as it has in the past several years," Mr. Jordan recently stated, "means that the hold of ice cream on the American public is firmly fixed, a permanent and steadily growing thing that is not easily affected by other conditions.

"To keep pace with it ice cream manufacturers more and more must keep up to the minute in their methods of production and selling, and in the service they render not merely their customers but the ultimate consuming public.



"The two great exhibitions managed by The Association of Ice Cream Supply Men this year in Buffalo and Atlanta will enable the ice cream plant owners and managers of thirty five states to examine and compare the merits of every class of article and service at a minimum of expense and time and yet with a maximum of convenience and pleasure.

"The manufacturers of the south, in particular, a section better adapted by nature for ice cream sales than any other, are vitally interested in the Southern Exhibition in Atlanta, November 28 to December 2, inclusive, the first of its kind ever held in that territory. The Eastern Exhibition in Buffalo, October 31 to December 5, inclusive, unquestionably will have a profound effect on the next year's further development of the immense investments in ice cream manufacturing equipment that now are at work in almost every community in the eastern and central states."

The Association has announced that arrangements are being made for the greatest attendance at its exhibitions that have ever been anticipated.

One reason why women talk so much more than men is because they do not get snubbed so much for it by the fathers when they are young.

Soon Pays for Itself—
then PAYS PROFITS

The MOJONNIER MILK TESTER is now an essential in all ice cream plants.
With it you can standardize your mix accurately—sold direct or through your jobber.

JACK RABBITS

ELWIN F. WEIL, Secretary

514 New York Life Bldg.,

Kansas City Missouri

Morrissey, (Joe for short) of DeCoursey Creamery Company, Kansas City, Kansas, has been hopping around his own state and Oklahoma and Missouri, rubbing noses with others of the hairy clan. We wonder why Joe always picks on "Bouvy." Read his letter:

"The writer had a pleansant visit with Mr. Frank Bouvy of the Purity Ice Cream Company, Tulsa, Okla. He visited with us Thursday, July 28th. Our friend, Bouvy was looking "fat and saucy" and if his personal appearance reflects his business, we are frank to state that he is doing fine. We are glad to see Frank and his other half, Porter, do well.

"The writer recalls pleasant visits from A. C. Sweeney of the Heller Company, Hugh Harrington, Consumers Gelatine Company, Mr. Spaulding, Sethness Company, A. E. Evans, Kennedy Supply Company, George Chapman of the David Watkins Company and other distinguished Jack Rabbits, whose names I just now cannot call to mind. They are all wondering as to the next convention of the Kansas Association and are wondering whether it will be in Topeka or Kansas City or where. The writer did not want to make any predictions as to where it will be held, but personally felt like going down to Mr. Manley's town."

* * *

Out here in Kansas things are running along as smoothly as one dollar wheat will permit.

The ice cream makers are making a mighty high class product. More people are eating ice cream than ever. Most every ice cream man is up on his toes and working over time.

The report from the northeast part of the state says they are having trouble with the rural telephone lines. The corn is growing so high that the ears are hanging over the telephone wires and the farmers along those routes refuse to let them cut the corn without paying for it. "**Some Corn.**"

One of the leading ice cream men in the state tells this story:

He has a young man in his employ who has some reputation as an amateur boxer. He was asked to stage a bout as a preliminary to a match held. When told whom he was to battle with he remarked that his mother objected to his fighting. His solicitors said that would be all right, as his mother need never know. To which he replied that his mother would see the doctor leaving the boy's home.

More next time.

ONE OF THE JACK RABBITS.

LARGE MILK CAN COMPANIES CONSOLIDATE.

Users of milk cans and ice cream cans will be particularly interested in the changes that post-war conditions have brought about in the making and marketing of these products. The recent combination of the Sturges & Burns Mfg. Co. and the Solar Metal Products Co., whose "Ultra" pattern ice cream cans have won for them a prominent position in the trade, is significant of the tendency of the times.

Wide-awake business concerns — those worthy to live and continue in their service to the public—realize that under present conditions a reviving market depends entirely on the practice of scientific economics. War's waste can be paid for only out of savings, and where the world cannot save it will not buy.

As fast as the manufacturers reorganize on this basis, the public shows its appreciation in terms of dollars and cents. The manufacturer who does not recognize the conditions, will drop from the running.

Production of standardized articles on a large scale is, of course, the key to lowered manufacturing costs. But rigid economics must likewise be effected in the administration of business and the distribution of products, otherwise the chain from maker to consumer will be broken.

The new company is called the Solar-Sturges Mfg. Co., and has taken over the business, manufacturing facilities, and personnel of the two original concerns. The splendid equipment of the new company will hold production costs to the lowest notch and the saving in expense of administration and distribution through combination of effort, is reflected in the prices quoted on goods.

Main offices and show rooms will be maintained in Chicago, with factories at Chicago and Columbus, and branch warehouses in principal centers throughout the country. A high development of service is naturally to be expected from the union of two such enterprising concerns.

ACTIVITIES IN THE NORTHWEST FOR THE NATIONAL DAIRY SHOW.

Meetings and picnics of farmers and dairymen are the order of the day in the Northwest, at all of which great interest is being shown in the National Dairy Show to be held in the Minnesota Fair Grounds, October 8th to 15th next.

The Northwest Minnesota State Editors Association held an outing last week at Duluth, where the business interests of the city through their organization, gave the editors an opportunity to see the possibility for agriculture, particularly by automobile tours through that section of the country, embracing visits to many of the successful farms.

The general manager of the Dairy Show was invited to talk to the editors at the Jean Duluth farm, a splendid setting for a good message and the State Editors promised to give every possible support by giving information regarding the Show to their readers.

On Saturday last, the Woman's Welfare Service and the County Agent of Polk County, Wisconsin, called a meeting of the farmers and breeders in the county, to be held in Milltown. There was a ball game and a band concert and the park place was filled with farmers. The speakers invited were Mr. Quamme of the Federal Land Bank, Mr. J. M. Hackney of St. Paul, Mr. E. T. Winship of Winona and the general manager of the Dairy Show.

Mr. Quamme was compelled to attend a meeting at Washington, so the speaking was left to the other three who talked chiefly about the coming of the Dairy Show and the result was an enthusiastic acceptance of the invitation to come to the Show.

Many other counties in Wisconsin and Minnesota have held meetings and representatives of the Dairy Development Associations were present and received assurance of active interest which will result in automobile and railroad excursions to the Show.

The work going on to spread the gospel of the Dairy Show all over the Northwest States means the biggest attendance the Show will ever have had. The opportunity to see these enthusiastic interested dairymen at the show and on their farms, is worth the cost of a trip from any part of this great country of ours. Let us all go

The Grand Rapids
ICE CREAM CABINET OF QUALITY

True Economy

IT is sometimes difficult to determine just what is true economy but not in the case of ice cream cabinets.

Here true economy lies in the ice conserving factor and the ability of the cabinet to stand constant usage over a long period of years. It is these attributes which have won for Grand Rapids Cabinets their high standing in the trade.

STYLE No. 4

Manufacturers who furnish their customers Grand Rapids Cabinets have the satisfaction of knowing that in this particular matter they have done their utmost in the way of service.

"COFFEE" AN INCREASINGLY POPULAR FLAVOR FOR ICE CREAM.

Considering the vast quantities of coffee beans imported by the United States each year it would be hard to say that coffee is not the most popular household drink of the Nation.

But only recently has this fact been capitalized and the popular coffee flavor been introduced into so widely eaten a dish as ice cream. To the ardent coffee drinker this coffee flavor makes a strong appeal. But where introduced by the ice cream manufacturer as a "special" flavor it finds favor with the average ice cream eating public.

The "Special" flavor, now used by many ice cream manufacturers to promote the general popularity of their product, and usually introduced as a little something out of the ordinary for the "week end" ice cream brick, has a wide field of exploitation. Such flavor as "coffee" would be ideal for this class. The name in itself would need no introduction and if the old time "kaffe-klatch" (afternoon gossip over a cup of coffee) retains its popularity, the present day dish of ice cream could supplant the less beneficial cup of coffee with the wider introduction of a coffee flavor. If such a condition could be brought about, think of the benefits that would accrue to the ice cream industry. Especially would such a development prove beneficial to the ice cream industry, because it would tend to promote the sale of ice cream at a season when larger sales are not the result of a natural demand caused by hot weather.

Limpert Brothers, a concern of manufacturing chemists located at Vineland, New Jersey, are manufacturers of a coffee flavor whose source of extraction is the coffee bean. The finished product is a concentrated liquid similar to other commercial extracts used in ice cream making. It will be interesting to note the development of so widely a known flavor as "coffee" in ice cream.

Fifth Edition

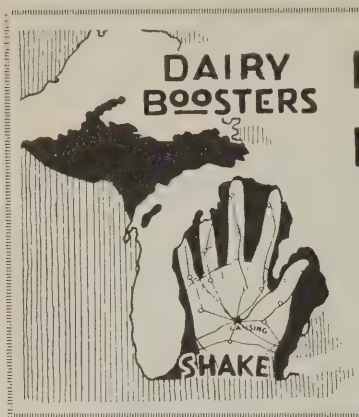
MAILED ON RECEIPT OF

$1.65

Contains Single FORMULAS that have made fortunes for the users.

CONTAINS THE WORLD'S EXPERIENCE IN

Ice Cream and Home-Made Candies



FOR THE CATERER — Fancy Ices, Frozen Fruits, Bombs, Sherbets, Parfaits, and Plain and Fancy Creams.

ICE CREAM MAKER — All that is known about Ice Creams, Ices, Fancy Fruit and Nut Creams, Brick Creams, "Condensed" and Gelatine Formulas.

CANDY MAKER — Takes the BEGINNER from the "A B C's" through the whole range of Popular Home Made Sweets.

The Chapter on "BRICK CREAM" shows how to blend Colors and Flavors, and so plainly that it is easy to follow. The "Guide" is used and endorsed by DAIRY AND DOMESTIC SCIENCE DEPARTMENTS, in many STATE COLLEGES, and by the entire profession is accepted as AUTHORITY. Contains 124 pages, copyrighted, and is PRACTICAL. The Formula for "Fortuna" Cream made a fortune for its originator, and has never before been published; the "Guide" is full of SECRETS. Will be sent postage prepaid upon receipt of $1.65. Address:

Editor The Ice Cream Review:

You are right! The boys on the road who are members of State Supply Men's Associations, could benefit each other considerably if they would only report to you the news from their territory. In that way, we could keep each other posted. In my travels I meet some of the boys occasionally and usually the first question that is popped to me is:

"Do you know where there is a new plant being built?" "Is so an so in the market for this,—or that?" etc., etc.

I usually come back with the question: "Why do you expect me to know all this?"

And they usually say that I cover the field a little more thoroughly and ought to be better posted. Maybe this is true, but there are others that are just as well posted on current events as I am. Why don't they do their share of reporting to The Ice Cream Review and to the Supply Men's Associations? If they would all do their bit, we would have plenty of news that would be of benefit to us all.

Just the other day a salesman told me that he didn't cover the field well enough to get news of any value, and I told him in very plain words that 'if he felt that way about it, he was not entitled to get any news from anyone else.'

Now boys, there is just one more thing I want to say. Lets all get together and boost. Send in your news and your ideas obtained from your territory. I don't know all that is going on in the territory that I cover, nor do you know of anything that is being planned in yours, but what I don't know, and what you don't know, someone else does, and if we will all just send in our reports, the dissemination of news will be a very simple proposition. C. J. YUNCKER.

Amen!—Editor. * * *

Connor Bros. Ice Cream Co., Coshocton, O., will make some improvements in their plant for next season.

The Supreme Ice Cream Co., Coshocton, O., will build a new cement block building, size 50x75 feet, two stories, for ice cream plant, and will then add new outfit consisting of viscolizer or homoginiezer, pacteurizer, ten ton refrigerating outfit, etc.

Wm. Gretzinger, at Loudonville, Ohio, has put in an ice cream plant and also a refrigeration outfit.

Paul Wilson, at Galion, O., has opened up a new confectionery, also an ice cream plant, and is doing fine. In the fall he will move in his own building and will then install refrigeration machine and storage room. Mr. Hubely is making the ice cream and candy for him. No doubt the boys will be glad to head of Mr. Hubley being back in the business in Galion.

Davis Bros., Massillon, Ohio., have built a new concrete building for their ice cream business.

Essi & Khourig, Bryan, Ohio., have insatlled a York refrigerating machine in their plant.

J. V. Mast, Newark, Ohio., has added a new ice cream freezer and enlarged his cold storage room.

J. F. Harms is no longer with Seneca Dairy CCo., Fostoria, Ohio.

Hunter Dairy Co., Lansing, Mich., has gone into the ice cream manufacturing business.

The Findlay Dairy Co., Findlay, Ohio, is now doing a fine ice cream business. They made a hit with the trade on good ice cream and did well when they hired Mr. Sam Gill, from Toledo, O., to take over the management of their ice cream department. Sam knows how to make the goods and can please the public.

The Defiance Ice Cream Co., Defiance, O., reports that their ice cream business is large and will have to enlarge their cold storage room and add more to their plant to take care of their business for next season.

THE PEACE PIPE — MINNEAPOLIS.

"From the vale of Tawasentha,
From the Valley of Wyoming,
From the groves of Tuscaloosa,
From far-off Rocky Mountains,
From the Northern Lakes and rivers
All the tribes beheld the signal,
Saw the distant smoke ascending,
The Pukwana of the Peace-Pipe."

The Indiana Warriors of the Ice Cream Tribe have seen the Signal, "The distant smoke ascending" from the "Mountains of the Prairie" and will smoke the Pipe of Peace with all other Warriors gathered in the wigwams of the Supply Men at Minneapolis from October eighth to the fifteenth, not far from

"Where the Falls of Minnehaha
Flash and gleam among the oak trees."

The National Dairy Show is the one National event that brings together representatives of all the departments of the big dairy cow industry. Men who attend this Show, depend upon it, are not strangers to one of the first principles of success — KEEP UP TO DATE.

Hoosier Tribes will be there in the front seat. Ice cream manufacturers, butter manufacturers, milk distributors, condensing factories, dairymen, supply men and their squaws and papooses, have "washed the warpaint from their faces" and are preparing to hit the trails for the great National Dairy Show at Minneapolis. A. P. HOLLY, Gen. Sec'y,

Indiana Manufacturers of Dairy Products.

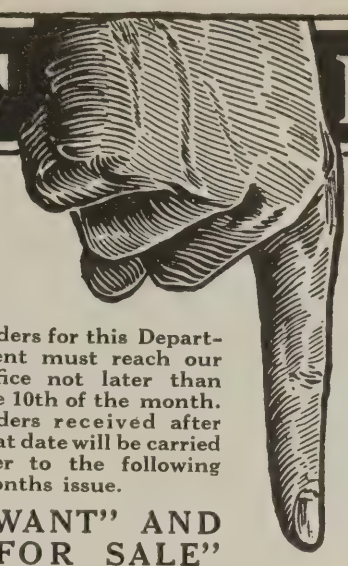
NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS.

To Ice Cream Manufacturers:

Are you going to the convention?

If so, immediate action is necessary!

The Ice Cream Manufacturers Train De Luxe leaves Chicago at 8:15 A. M. Saturday, October 8th, arriving Minneapolis 9:00 P. M. the same evening. Everything has been arranged so that you will travel in comfort and enjoy the luxuries awaiting you.



The Special Train will carry parlor cars, observation car, dining cars and a coach for those not desiring parlor car, thus assuring every convenience. In addition to this there will be a Passenger Agent aboard the train to look out for your comfort.

A distinctive feature of the De Luxe Special Train will be the Table D'Hote Luncheon ($1.25) and the Famous Dinner ($1.50).

ATTENTION: Instructions regarding **Reduced Rates.** When you purchase your railroad ticket buy a regular one way ticket to the convention and insist on a **Convention Certificate.** It must be understood that re-

duced fare is contingent on an attendance of not less than 350 members of the organization, or dependent members of their families, at the meeting holding regular issued certificate from ticket agent at starting point showing payment of normal one way tariff fare of not less than 67 cents on going trip.

When the required 350 certificates are presented same will be validated by special agent and will entitle the holder of a certificate to a return ticket via the same route as going journey at one half the regular fare.

It is hoped that all Ice Cream Manufacturers will arrange to travel on the Special Train. But should you not be able to avail yourself of that service it will be appreciated if you will use either of the following C. M. & St. P. express trains:

Leave Chicago, Union Station, Adams and Canal Streets, 8:15 A. M., 10:00 A. M., 6:30 P. M., 8:15 P. M., 10:15 P. M.

Arriving Minneapolis, C. M. & St. P. Station, Washington & 3rd Ave.: 10:00 P. M., 10:45 P. M., 8:05 A. M., 10:05 A. M., 11:30 A. M.

All these trains have parlor car, sleeping cars, dining car, observation or lounging car service.

Will you meet us on Saturday morning, October 8th, when the big special conductor cries, "All Aboard?" If so, fill out the Train Reservation Blank below and mail direct to Mr. F. N. Hicks. Do it now and have no regrets, for he who hesitates is lost.

Sincerely yours,

N. LOEWENSTEIN,

* * * Secretary.

TRAIN RESERVATION—National Association of Ice Cream Manufacturers, Minneapolis, Minn., Oct. 10, 11, 12, 1921.

Mr. F. N. Hicks, G. A. P. D.

C. M. & St. P. Ry.,

620 Marquette Bldg., Chicago.

I will attend Convention, using Special Train leaving Chicago at 8:15 A. M. Saturday, October 8, 1921.

NEWS FROM FAR AND NEAR.

Los Angeles, Cal.—The Chapman Ice Cream Company has been incorporated for $25,000 to manufacture ice cream and confections.

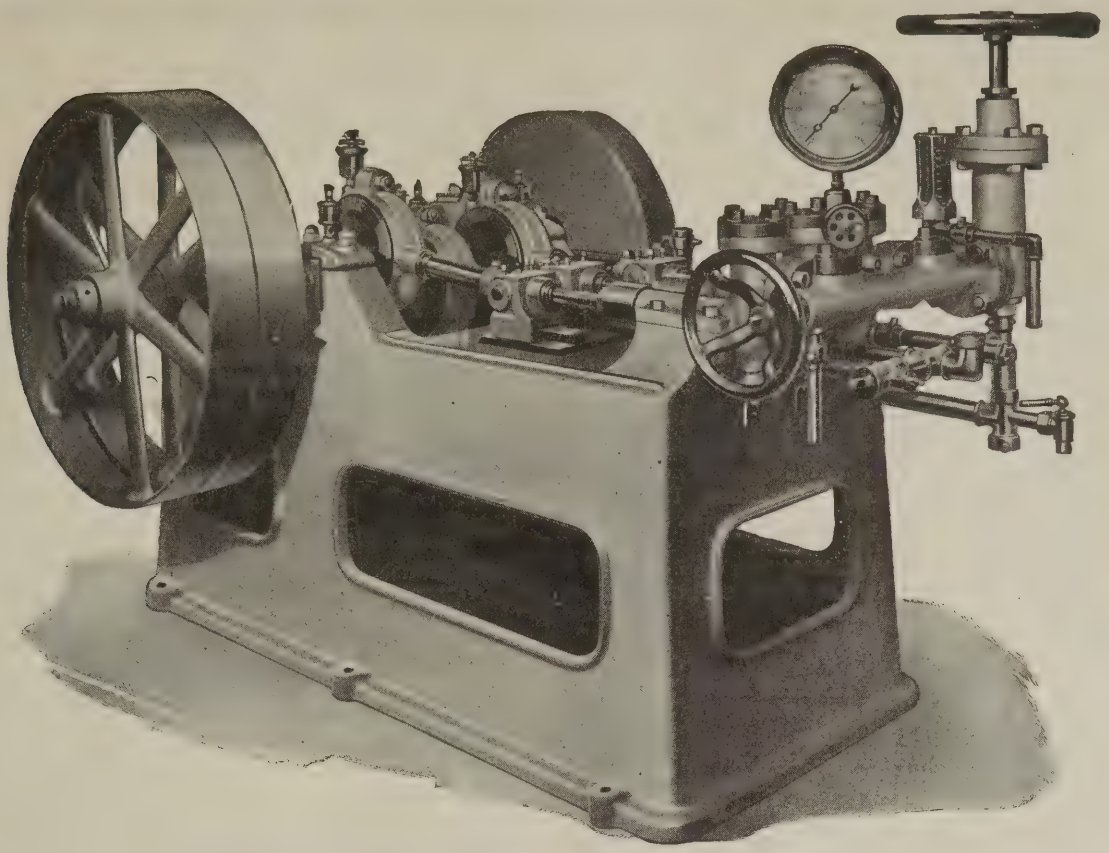
Santa Maria, Cal.—Messrs. Hitt & Hiller, proprietors of "The Chocolate Shop" have contracted with the Doane Building Co., to erect a large addition to their present plant for the purpose of manufacturing ice cream for wholesale trade. The new factory will be built on West Main street.

Tulare, Calif.—The Armour Company, A. H. Smith and O. H. Cooley, managers, have purchased a creamery formerly owned by J. H. Frew, have installed new freezers and have enlarged the refrigerating rooms and general capacity of the ice cream plant.

Middleton, Conn.—Announcement is made that the Millbrook Dairy Co., has made plans to erect a new $30,000 ice cream manufacturing plant.

Elgin, Ill.—Messrs. F. H. Witherel and J. R. DeLancey of Elgin have purchased the ice cream manufacturing business of the Kind Baking Company on McBride Street. The new proprietors will manufacture ice cream and sell it to the wholesale trade of Elgin and territories tributary thereto.

Rockford, Ill.—The Crescent Ice Cream Company has increased both its ice making and ice cream making capacity.



Madisonville, Ky.—John Long is preparing to build a modern ice cream factory in the downtown section of Madisonville.

Toledo, Ohio—A new million dollar ice cream and dairy plant is reported about to be incorporated by the farmers and other citizens in this city and vicinity.

Muskogee, Okla.—The Muskogee Ice Cream Company has been incorporated for $50,000 by C. P. Gotwals, C. E. Shannon and L. F. Austin of Muskogee.

Springfield, Mass.—A. Judesse has opened up an ice cream plant and in connection therewith will operate a milk business.

Port Huron, Mich.—The Wilson Ice Cream Co., is contemplating a number of plant improvements this fall including the installation of an ice plant.

Progress Homogenizer DH-4B, 400 Gallons

Principal Use Is in Ice Cream Industry

The principal use of the Homogenizer is, without doubt, in the preparation and treatment of ice cream mixtures. The ice cream manufacturer is no longer obliged to pay exorbitant prices for cream during the summer months when ice cream is in great demand and raw cream is scarce. Thanks to the development of the Homogenizer frozen cream can be stored during the plentiful period and converted back to its natural state when needed. Unsalted butter is also stored in large quantities and used by the ice cream maker as a basis for his cream. The Homogenizer, at a pressure of about 2,500 pounds, will restore the frozen cream or emulsify butter and skimmilk to produce a cream equally as good as the fresh product in flavor, body, and food properties.

Perhaps the greatest single use of the Homogenizer is for treating the ice cream mix before freezing. The ice cream batch is regularly heated to a pasteurizing temperature which thoroughly dissolves and mixes the sugar and other ingredients, and is then homogenized at about 3,500 pounds pressure. The great advantage of homogenizing the entire mix is that it makes the butterfat and solids go farther than would otherwise be the case. Since the solid particles are so finely broken up and uniformly distributed, they give the finished product a richer taste and a firmer body. An ice cream made from a homogenized mix will have a much better texture and will taste richer than an ice cream made from the same mix but not homogenized.

The exact treatment of ice cream mix is rather difficult to specify without knowing the individual conditions involved. The composition of the mix and the design of the machinery will greatly influence the temperature and the pressure to give best results. Where vats are used for mixing and pasteurizing, it is usually advisable to homogenize at the pasteurizing temperature of about 142° and directly from the vats. The action of the Homogenizer will increase the temperature slightly and the finished goods should be immediately cooled to 50° or lower and held until ready for freezing. The pasteurizing process will usually bring the mix back to its natural state so far as viscosity is concerned and, therefore, the addition of a starter or aging of the cream at low temperature, is necessary to obtain the desired body.

In large and complete plants where the mechanical equipment is available, it is considered advisable to pasteurize the mix at 142°, then heat to about 160°, and to pre-cool quickly to 120° on the way to the Homogenizer. This treatment gives the best possible bacteriological condition and a distinctive and pleasing flavor and excellent homogenizing results. It should be the object of each manufacturer to study his conditions carefully and to treat his mix in the best manner and in the same manner every day so that his product can always be distinguished by its flavor, texture and richness.

Those who are considering the installation of a Homogenizer may obtain full and complete information by addressing our Sales Branch in their territory.

BULLETIN OF EVENTS

National Dairy Show, Minnesota State Fair Grounds (between St. Paul and Minneapolis)—Oct. 8-15, 1921. W. E. Skinner, General Manager, 910 So. Michigan Ave., Chicago, Ill.

National Association of Ice Cream Manufacturers—Twenty-first Annual Convention, Hotel Radisson, Minneapolis, Minn., Oct. 10, 11 and 12, 1921. Secretary, N. Loewenstein, 155 No. Clark St., Chicago.

Eastern Exposition, Association of Ice Cream Supply Men—At Elmwood Music Hall, Buffalo, N. Y., October 31st to November 5th, inclusive. Roberts Everett, Secretary, 1328 Broadway, New York City.

Pacific Ice Cream Manufacturers Association—Annual Convention, Nov. 14, 15, 16, 1921, Seattle, Washington. Bert H. Walker, care of Royal Ice Cream Co., Tacoma, Wash., Secy.

West Virginia Association of Ice Cream Manufacturers—Annual Convention, at Wheeling, W. Va., November 21st and 22nd. C. F. Jamison, Huntington, W. Va., Secretary.

Southern Exhibition—Association of Ice Cream Supply Men, Auditorium Armory, Atlanta, Georgia, November 28-December 2, inclusive. Roberts Everett, Secretary, 1328 Broadway, New York City.

Southern Association of Ice Cream Manufacturers—Ninth annual convention, Atlanta, Georgia, Nov. 29, 30 and Dec. 1, 1921. J. W. Clopton, Decatur, Ala., Secretary.

North Carolina Ice Cream Manufacturers' Association—Annual Convention, at Atlanta, Ga., in connection with Southern Exhibition, November 28th to December 1st. Headquarters, Ansley Hotel. A. E. Dixon, Fayetteville, N. C., Secretary.

Texas Ice Cream Manufacturers' Association—Fourteenth Annual Convention, Ft. Worth, Texas, December 7, 8, 9, 1921. Headquarters, Texas Hotel. H. F. Owsley, Dallas, Secretary.

Oklahoma Association of Ice Cream Manufacturers—Annual convention, Oklahoma City, Dec. 12-13-14, 1921. Secretary, M. T Cochran, Altus Ice Cream Co., Altus.

Kansas Association of Ice Cream Manufacturers—Annual Convention, Kansas City, Mo., December 15, 16, 1921. B. T. Perkins, Pittsburg, Secretary.

Louisiana Association of Ice Cream Manufacturers—Second Annual Convention, New Orleans, January, 1922. Newton F. Manning, Monroe, La., Secretary.

Michigan Allied Dairy Association—Annual Convention, in Municipal Auditorium at Saginaw. Tentative dates, Feb. 14, 15, 16, 17, 1922. H. D. Wendt, General Secretary, Lansing.

THIS is the annual National Dairy Show edition of The Ice Cream Review. We hope it will enjoy a favorable reception by our readers. We have put in a lot of hard work to make it worthy of its name. It represents not only the labor and thought of our organization, but it also represents the hearty co-operation of an army of the most faithful folks who ever backed up a trade publication.

The Ice Cream Review is too big and too powerful for one office to handle. It has grown beyond us. All we try to do is to direct policies and assemble what comes from hundreds of folks who feel that they are members of The Review family. They are really the owners of the paper in the big sense that they are largely responsible for it and for the important work it is doing to promote the ice cream industry.

It is just a little over four years old. Only a baby, but a husky one and well beyond the colic stage. Its growth has kept pace with the development made during the past four years by the industry which it champions.

This issue is dedicated to the National Dairy Show and the annual convention of the National Association of Ice Cream Manufacturers. It contains many urgent appeals to ice cream men to visit the big doings in Minneapolis next month. We hope that these appeals will bring a big attendance. We want to see you there. And we hope that the man who can not attend will gain from this issue of The Ice Cream Review a better understanding of the show and of the National Association than he ever had before.

We take this opportunity to thank the friends all over the country who have helped to make this issue what it is.

IT IS very pleasing to dairymen in other branches of the business to see the way the ice cream manufacturers all over the country are boosting for the National Dairy Show. Of course, holding the annual convention of the National Association of Ice Cream Manufacturers in a nearby city makes it easy to boost for the show, but it is pleasing to the on-lookers just the same.

There was a time in the history of the National Dairy Show when other dairymen questioned the loyalty of ice cream manufacturers to the dairy industry. They wondered whether the average ice cream manufacturer was interested in the development of the dairy industry or whether he was only interested in producing ice cream as cheaply as possible, even to the extent of using substitutes for dairy products in making it.

The chief aim of the National Dairy Show is to advertise and promote the entire dairy industry. When the ice cream manufacturers of the country get behind the show as they are now doing it is further evidence that they are just as interested in promoting the dairy industry as the butter man, the cheese man,

the milk man or any other of the many representatives of the industry.

The ice cream manufacturers of this country, through their national organization have gone on record in favor of using pure dairy products in making ice cream. They are following up this action by boosting for the National Dairy Show in a way that stamps them as real dairy enthusiasts, who are backing up their words by their deeds.

Any branch of the ice cream industry which feels that it is too important not to boost for the National Dairy Show is hanging a mill stone about its neck. The ice cream manufacturers of this country are big enough and broad enough to boost for whatever promotes the dairy industry, and any affiliated branch that does not realize this fact is making a big mistake. Again we want to commend the ice cream manufacturers for their bigness in boosting for the National Dairy Show and the annual convention of the National Association of Ice Cream Manufacturers.

THE ice cream industry is so young and growing so fast it would be unreasonable to expect that all of the problems incident to the business would be settled up to date. Some day when more of the big problems have been solved we will look back to 1921 and smile when we consider the comparatively crude methods which now prevail. This may sound like a wild prophesy to some, but if it is then the ice cream industry will have a different history than other industries in which methods have been improved from year to year covering a long period of time.

Some ice cream manufacturers are right now years ahead of their competitors in the race to secure a high consumption of their product. They have solved many of the problems which now hinder most ice cream manufacturers in their efforts to build up tonnage.

One of the chief faults of ice cream, as found on the market, is the lack of uniformity of temperature. When the customer calls for a dish of ice cream he is too often furnished with cream that is too soft or too hard. He is not always furnished with ice cream that is "just right." The degree of hardness of the ice cream at the time the consumer eats it makes a big impression on him. It materially affects the opinion he forms as to the quality of that particular ice cream. Possibly our cabinet manufacturers would do well to investigate the practicability of using a small mechanical refrigerating machine in connection with their cabinets, so as to secure uniform temperatures.

We are not blaming anybody for this condition of affairs. It is simply one of the big problems to be worked out. We know that it is difficult to get ice cream to the consumer at just the right temperature, but we have faith enough in the men in the industry to predict that sometime this problem will have been solved. It is one of the faults of the trade to-day, but some day it will be corrected. It must be corrected before the consumption of ice cream will have reached the maximum.

"BUSINESS is good!" exclaims the enthusiastic ice cream manufacturer when a friend asks him about his gallonage. Gallonage may even be slipping but "business is good." He makes it that way whether things are running along smoothly or whether there is a monkey wrench in the machinery. He just will not get discouraged. At least if there are any tears to shed he doesn't collect a crowd about him to see him shed them.

The optimistic business man is usually a progressive business man too. He uses his knowledge to make business good. His progressive spirit backs up his optimism. No wonder "business is good" with such a fellow. He is the kind of a fellow who makes good in any business. His optimism attracts trade because customers like to do business with the man whose business is thriving. Yes, "business is good" is a mighty good slogan.

MR. W. P. ABEL, President of The Impruv-Mix Co., New York City, paid The Review office a call one day recently while in the city. Mr. Abel was calling on his many customers and sizing up business conditions generally throughout the country. He reports a splendid season's business for his firm.

WE CORDIALLY invite the readers of The Ice Cream Review to make their headquarters at Booth 186 while attending the National Dairy Show. We want to get better acquainted and you will find us right on deck trying our best to make everybody feel at home.

THE PRESIDENT SPEAKS.

It is my desire at this time to urge every member of our association to arrange in some way to permit of their attending our convention to be held in the Twin Cities October 10th, 11th and 12th. You can be assured of a wonderful time, as I understand the Twin City members of our association are arranging a splendid entertainment feature, and I am sure you will all be given a program that will warrant your making the trip.

The location of the National Dairy Show at the Minnesota State Fair grounds is a most wonderful place for the holding of the convention, located as it is mid-way between St. Paul and Minneapolis, and very accessible.

The exhibits this year will out-do the exhibits of any of the previous shows held, and I feel that it is due the West that a large attendance prevail.

F. N. MARTIN, President.

TENTATIVE PROGRAM

Convention of the

National Association of Ice Cream Manufacturers

October 8, 1921

Special train leaves Chicago via the C. M. & St. P. Railway for the Convention. Time of departure, 8:15 A. M.; arrives Minneapolis at 9:00 P. M., with a stopover at the Dells of Wisconsin, which will afford an opportunity to view the scenery there, classed as about the most beautiful to be found anywhere.

October 9, 1921

Registration.

Directors' Meeting.

October 10, 1921

Registration.
Address of Welcome.
Response to Address of Welcome.

Report of Secretary.
Report of Treasurer.
Address of President.

Adjournment at 12:30 P. M.

October 11, 12, 1921

Subjects for Consideration

Progress in Studying Causes of Sandy Ice Cream.....Dr. O. E. Williams
Dairy Mfg. Specialist, U. S. Department of Agriculture, Washington, D. C.

Developments in the Express Situation.....Mr. F. D. Jones
Davies & Jones, Washington, D. C.

The National Dairy Council in Its Relation to the Ice Cream Industry.....Col. M. D. Munn
President, National Dairy Council.

Proper Depreciation for Ice Cream Equipment.....To Be Assigned

Value of Ice Cream in the Diet.....To Be Assigned

The Layout and Design of a Modern Ice Cream Plant.....Mr. F. D. Chase, C. E.
Chicago, Ill.

The Refrigerated Truck in Ice Cream Delivery.....Mr. J. H. Schindler
Telling-Belle Vernon Co., Cleveland, Ohio.

Address.....Hon. C. Heen
State Dairy and Food Commissioner, St. Paul, Minn.

Increasing Ice Cream Sales in Winter...Mr. W. M. B. Sine
Imperial Ice Cream Co., Clarksburg, W. Va.

An Innovation in the Ice Cream Industry.....To Be Announced Later

---

The matters to be discussed by the Directors this year are of unusual importance to the Association, including, as they do, various problems that have arisen affecting the industry.

President Martin has appointed several very important committees during the year, the chairmen of which will bring in their reports at the Convention.

Mr. C. G. Morris, Vice-President of the Association and Chairman of the Tax Revision Committee and the Code of Ethics Committee, will have two reports of very great importance to members.

The following gentlemen will also report the activities of their various committees:

Mr. A. B. Gardiner, Chairman, Research Laboratory Committee.
Mr. T. H. McInnerney, Chairman, Express Rate Committee.
Mr. S. T. Nivling, Chairman, Cost Accounting Committee.
Mr. T. D. Cutler, Chairman, Committee on Weight and Shrinkage.

Entertainment

Monday afternoon and evening the Convention will be turned over to the Ice Cream Manufacturers of the Twin Cities, who will entertain the visitors in a royal manner.

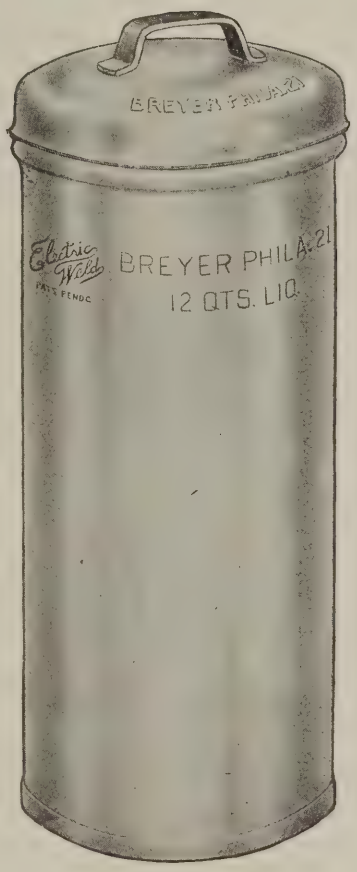
On Tuesday morning the ladies will be taken on a sightseeing tour of the Twin Cities.

On Tuesday evening, the Annual Banquet of the Association will be held.

On Thursday the visitors will assemble for a trip to the Dairy Show.

N. LOEWENSTEIN, *Secretary*.

WHEN YOU VISIT THE DAIRY SHOW SEE



Electric Weld Trade Mark, Registered

Rivetless - Solderless Ice Cream Cans

At Our Booth No. 338—Mezzanine Floor

The Electric Weld GUARANTEE

1. That no solder, lead or rivets are used in the construction of Electric Weld Ice Cream Cans.
2. That all Electric Weld cans are made of a specially prepared copper-bearing, rust-resisting steel known as "tinning" or "dairy plate" and made of the same gauge material as specified in our advertising.
3. That all welds, being subjected to hammer and pressure tests, are sound and will not crack, break, leak or come apart.
4. That the can is completely assembled in the black before tinning and that it is coated by soaking the entire can in one piece in pure "straits" tin by the old-style hand dip, triple coating process.
5. That Electric Weld cans are of exact capacity and that each can is carefully examined and stamped by our Inspection and Test Department before shipping.

Patent Allowed.

The Electric Weld Ice Cream Can.

The Retinning Feature

Electric Weld Ice Cream Cans may be retinned over and over again at small cost. They are made complete in the black, leak-proof and ready for long service. Every time you retin an Electric Weld you can save approximately 30 cents. Write for prices, list of "Repeat order buyers" and other data pertaining to the **Solderless Can.**

The Non-Deforming Lid

Non-deforming edge keeps the lid round. THE RIM: One-piece expanded bead rim reinforces and protects the can from hard knocks and affords a positive grip for wet, slippery hands. SEAM: Butt welded, solid fusion of the joint that will not crack, break or leak. BOTTOM: A solid flanged leak proof bottom for hard wear and tear. No interstices or rolled edges to collect dirt. Affords a fine grip. Easy to clean. The strongest as well as the most sanitary bottom, three thicknesses soundly welded and solderless.

In 1920 the Horton Ice Cream Co., of New York, bought 2000; in 1921 a repeat order called for 5000 more. In 1920 the Breyer Ice Cream Co. of Philadelphia, Pa., bought 14,000; in 1921, 10,000. In 1920, Colonial Ice Cream Co., Philadelphia, Pa., 1000; in 1921, 30,000. Proof of quality and service in a nut shell.

Industry's Future Will Be Reflected In Convention

IT IS not so much the present nor the past, but the future, of the ice cream industry that the national convention in Minneapolis will mirror. The past is known, its lessons largely learned already; the present problems are working to their own solution, slowly but inexorably in these times of economic reconstruction. It is the future that commands the interest of the ablest ice cream manufacturer.

The time is past in any business when the mere happy statement that "this industry is only in its infancy" will suffice. That the ice cream industry now faces a tremendous future is every man's belief. But the history of successful industries is full of the repeated fact that futures must be planned for and successes safeguarded.

The significance of the convention in Minneapolis is not so much in the individual features of its unusual program, nor in the personalities that will meet there, as in the fact that the National Association represents in a measure an industrial self-consciousness that can plan for success and safeguard it when won. The ice cream industry is national—so will be the matters dealt with in Minneapolis. The ice cream industry has its individual, its unique problems and realization of this is evidenced in the very organization of the National Association. The ice cream industry requires concerted action, community of effort as well as of interest, co-ordinated purpose and industrial self-consciousness and the existence of these assets so essential to industrial development and protection is attested by the very fact of such a gathering as that to be held in Minneapolis.

It is the future that calls for intelligence, **for action,** for determination, for the mobilized power of the ice cream industry, exerted along definite lines of increased profit. It is the industry's attitude of approach to this future that holds so much that may be won that the Minneapolis convention will reflect and signalize.

ROBERTS EVERETT, Secretary,
The Association of Ice Cream Supply Men.

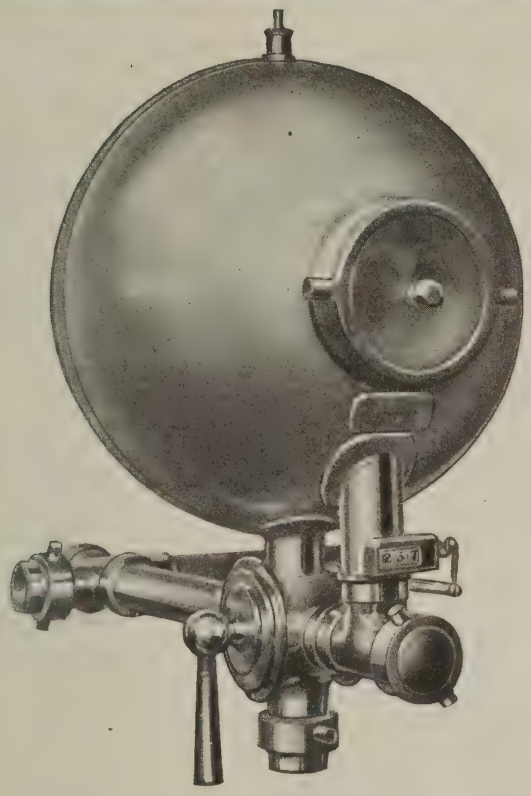
The Path of Progress

IT IS about as difficult to set forth new reasons why you should attend this convention, in following the path of progress, as it would be for a minister to give new reasons why you should go to church in following the path of righteousness.

Yet, actually, the man with the convention habit is the wise one. He learns by contact with his fellowman and goes home better fitted to carry on his work; he has gained in knowledge, keenness of mind and breadth of vision.

Again, the social spirit, invaluable in success winning, is kept alive and quickened by the convention atmosphere; there is an increased ease and delight in intercourse with one's fellows, and particularly will this be true of the convention, for already a very splendid spirit of comradery has developed. Reservations on the De Luxe Special Train from Chicago for the convention are being taken in an extremely satisfactory manner, and the ice cream manufacturers of the Twin Cities are planning some splendid social affairs.

Impress upon the ladies that they have a special invitation to this convention, and their pleasure and comfort will be well looked after.



A reduced railroad rate of fare and one-half for the round trip on the certificate plan has been granted; dates of sale, October 6th to 14th, inclusive. Return limit, October 19th.

No extra fare will be charged on the Ice Cream Manufacturers' De Luxe Special Train, which will leave Chicago via the C. M. & St. P. Ry., at 8:15 on the morning of Saturday, October 8th. This train will carry parlor cars, observation car. dining cars, and a coach for those who may not desire parlor cars. Reservations for this train may be made through F. N. Hicks, G. A. P. D., C. M. & St. P. Ry., 620 Marquette Building, Chicago.

Note the date and arrange to attend this convention. You'll enjoy every minute of it.

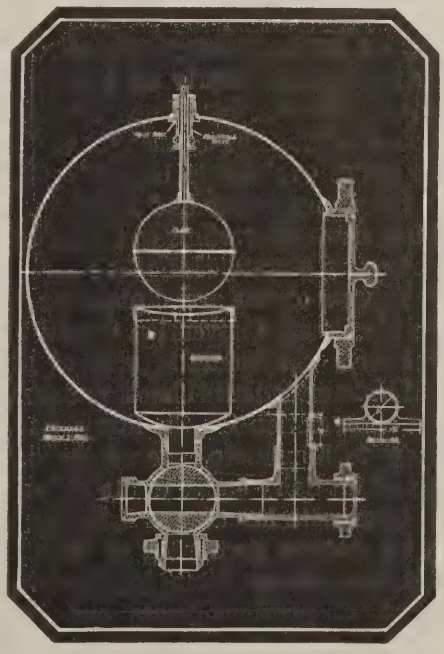
N. LOEWENSTEIN, Secretary,
National Association of Ice Cream Mnfrs.

THE C-B CALENDAR

Don't Overlook Our Exhibit at the Buffalo Show

Make sure you are there — Oct. 31 — Nov. 5

The photograph and drawing should give you a fair idea of these devices. They are automatic—gravity does all the work; just turn the valve handle to operate. They are very simple in construction with but 3 moveable parts. They are handsomely finished in nickel. They can be attached to any brine freezer, new or old. They are not very expensive and if a new freezer is ordered "with T. B. M." there is hardly any increase in price, since the old style batch tank is dispensed with.



Let us send you our new booklet which describes every detail and shows views of installations. It also contains a few of those enthusiastic letters we mentioned. Send for it; you can't afford to neglect an opportunity of familiarizing yourself with the greatest improvement for freezer rooms since the invention of brine freezers themselves.

Let This Be Your Last Summer Without Thomas Batch Measures

They have been so improved that not the slightest objection can be found with them. To the contrary, so many prominent ice cream manufacturers have already found them to be a great investment, that you have no excuse for further hesitation.

You should see the enthusiastic letters we receive from firms who have installed them. To say the least, they are convincing. Every manufacturer is quick to see the many advantages that Thomas Batch Measures possess, and appreciates them.

One man less in your freezing room counts for something. No running over and no waste counts for much. A way of keeping close tabs on the amount of mix used—the overrun—and a check against the finished product are extremely valuable advantages. T. B. M.s gives you all of them.

CHERRY-BASSETT COMPANY

PHILADELPHIA BALTIMORE

Minnesota, the Vacation Land of America

Minneapolis, Minn., Sept. 1, 1921.

Editor, Ice Cream Review,
210 Sycamore Street,
Milwaukee, Wis.

Dear Sir: The 1921 convention of the National Association of Ice Cream Manufacturers to be held in Minneapolis, October 10th, 11th and 12th, promises to be the biggest and best in the history of the ice cream industry. As it is held in conjunction with the Dairy Show it affords ice cream manufacturers an unusual opportunity to see the wonderful progress of the various branches of the dairy industry. Both Minneapolis and St. Paul are doing their utmost in planning entertainment for the many visitors and the whole northwest is in hearty accord with plans to make the educational features long to be remembered.

J. E. Woolsey, President, Minnesota State Assn. of Ice Cream Mnfrs.

The State Fair Grounds, where the Dairy Show will be held, is situated midway between the central points of the two cities and is conceded to be the greatest show place for that purpose in the country. Space for exhibits are nearly all contracted for at this time, the class of exhibits being such that the entire week could be spent at the Dairy Show and something new, interesting and educational discovered every minute of the time.

In view of this grand place for dairy exhibits the Ice Cream Convention should be doubly attractive. The manufacturers of the northwest will be in attendance almost to a man, thus showing appreciation for the first visit of the Dairy Show to Minnesota, one of the best and most important dairy states in the Union.

Minnesota has always been deeply interested in all matters pertaining to the dairy industry and has always been loyally represented at shows of previous years and it is sincerely hoped that other states will be equally loyal and have large representation.

Headquarters for the Ice Cream Convention will be at the Radisson Hotel, Minneapolis, a few minutes walk from all depots and but a few minutes from a dozen other hotels of the vicinity.

October in Minnesota is as wonderful to nature lovers as the beauties of the southern states and the many delightful drives and parks of the Twin Cities are clothed at that season of the year in the vari-colored autumn adornment so beautiful and yet so different from other seasons of the years. Minnesota is noted for its wonderful lakes and streams and the Twin Cities have taken advantage of these natural resources, arranged driveways, linked the lakes together in various ways so as to make this part of Minnesota the beauty spot of the northwest. The Indian mounds in St. Paul and the fish hatcheries are very interesting and beautiful, Como park is almost unexcelled.

In Minneapolis, St. Anthony Falls is a point of great interest, as well as the flour mills, the largest in the world. Minnehaha Falls, made famous by Longfellow in his poem Hiawatha, is also a place of interest. There are many other interesting and beautiful places in both cities and surrounding country that excite the admiration of all. Those who have never visited Minnesota will go back home with a greater knowledge of the resources of the Bread and Butter State and their minds will be disillusioned of the old ideas of the west. Indian tepees are no longer in evidence nor does the hardy plainsman drive into town emptying his revolvers as he rides up the main thoroughfare.

The Minnesota State Association of Ice Cream Manufacturers extends an urgent invitation to all ice cream manufacturers to attend the convention this year, honestly believing that all will be well repaid for the visit to the northwest. No effort will be spared to make visitors and members welcome and the visit pleasant, entertaining and educational.

Yours truly,

J. E. WOOLSEY, President,
Minnesota State Assn. of Ice Cream Mnfrs.

Minnesota in October Clothed in Nature's Gorgeous Hues — a Veritable Paradise

The Time, the Place and the Boys (and girl)

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW. MINNESOTA STATE FAIR GROUNDS, October 8-15

TWIN CITY FACTS

Saint Paul

The Capital City of Minnesota. Population, 250,000 including suburbs immediately adjoining legal boundaries of city.

The Gateway to the Northwest. Nine railroad systems enter the city. Four transcontinental lines, with others extending north and south, make Saint Paul the transfer point to all points north and south, east and west. Its location on ten automobile highways makes Saint Paul headquarters for tourists.

The Agricultural Capital of the Northwest. The chief purchaser of the agricultural products of the northwest. The home of the State Agricultural College, the State Fair, the Federal Land Bank, and of various farmers' marketing agencies which make Saint Paul the "Farmers' Market."

The Distributing Center of the Northwest. The chief distributor of the staple lines of merchandise consumed in its trade territory comprising the states of Minnesota, North Dakota, South Dakota, and portions of Wisconsin, Iowa, Nebraska, and upper Michigan.

The Manufacturing Center of the Northwest. The leader in the manufacture of a majority of the various classes of merchandise made in the northwest. Saint Paul leads in manufacture of meat products, fur goods, men's clothing, boots and shoes, foundry products, machinery, coke, gas, food products, candy, refrigerators, cigars, and numerous other kinds of manufactured products. Total value (1919) estimated at $215,000,000.

The Educational Center of the Northwest. The location of various denominational colleges and schools with high standards and large enrollments and the several state educational institutions give Saint Paul pre-eminence along educational lines.

A Most Desirable Residence City. Desirable residence sections, good schools, unexcelled local transportation facilities, numerous parks and playgrounds, excellent water supply, first class retail stores, and other numerous advantages make Saint Paul a most desirable residence city.

Minneapolis

Minneapolis is the largest city in Minnesota and the northwest—the manufacturing, wholesaling, financial and educational center of this vast, productive region.

Minneapolis postoffice receipts exceed $4,456,825.21 annually and its annual U. S. customs receipts are more than those of the rest of the state of Minnesota combined.

Minneapolis is the Federal Reserve City of the Ninth Federal Reserve Banking District. Bank clearings in Minneapolis in 1920 was $4,012,206,419. It must be remembered in making comparisons, that the Minneapolis Clearing House Association embraces only nine banks. The real indication of the banking and business strength of any city is more closely disclosed in its bank transactions. In this, the figure for Minneapolis in 1920 was $4,514,357,000.00. The city has sixty banks and trust companies. Bank deposits on Feb. 21, 1921, totaled more than $230,823,000.00.

Minneapolis is the "Vacation Capital" of the west. It is the possessor of five beautiful lakes within its own city limits and is the gateway to "The Ten Thousand Lakes of Minnesota." Every visitor to the state should plan to spend at least several days in Minneapolis, if not his entire vacation period.

Minneapolis is the world's chief flour manufacturer. The capacity of its flour mills is 93,000 barrels daily. Flour shipments have exceeded eighteen million barrels annually. The city's linseed mills have a capacity of 16,349,947 barrels annually.

Minneapolis, with its State University and notable private educational institutions, its art galleries, its Symphony Orchestra, its Municipal Band and various other agencies devoted to educational and civic activities is the recognized cultural center of the northwest, as well as its commercial metropolis.

Minneapolis has a population of 380,582, covering an area of 53.29 square miles.

THIS YEAR'S CONVENTION WILL BE GREATEST EVER HELD.

Before the National convention opens in Minneapolis, October 10th, I believe that every ice cream manufacturer in the country, whether his business is done in a small or large community, should join the National Association for his own profit. Only through a national association can an industry's present investments and its profitable future be safeguarded. The bigger it is, the more truly national, the better such an association can safeguard an industry. The ice cream industry needs to protect its own interests and that manufacturer who does not join it is, in my opinion, as negligent as if he failed to take out fire insurance policies on his plant.

Ample Accommodations for Dairy Show Visitors

MANY dairymen in the northwest who are planning to attend the National Dairy Show, to be held at the Minnesota Fair Grounds, Oct. 8-15, will be pleased to learn that there will be plenty of rooms in hotels and boarding houses to accommodate them during the period of this big agricultural educational exposition, and that they need have no fear of being charged exorbitant rates. This assurance has been given by the hotels, the St. Paul Association and Minneapolis Civic and Commerce Association. All the ralroads have agreed to give reduced and excursion rates consisting of one fare and a half, so everything possible has been done for the comfort and the economical interests of the prospective visitor to the National Show.

The same comfort will be found in the world's biggest cattle barn at the Fair grounds, where the show will be held. At an outlay of $100,000 this great building has been modeled to take care of more than 150,000 square feet of exhibits and to accommodate 2000 head of cattle. Complete heating apparatus has been installed, and a big mezzanine floor has been erected, where the exhibits will be displayed, in addition to the immense exhibition on the main floor.

Home of the 1921 National Dairy Show, Minnesota State Fair Grounds.

Visitors to the National Dairy Show with a little spare time on hand and a desire to visit the sights in and around the Twin Cities will find plenty to occupy their time.

The State Capitol.

Minnesota's beautiful capitol building rises majestically on a height of land on the north edge of the city overlooking the down town business district. This building, erected under the personal supervision of the famous archietct, Cass Gilbert, at an expense of $4,500,000, is one of the most beautiful structures in the country. Guides conduct parties through the building at regular intervals. Mural decorations and paintings by Howard Pyle, John LaFarge, Kenyon Cox, Guernsey, Blashfield, and many other famous artists make the tour through the building exceedingly worth while.

The new Minnesota Historical Society building is located directly opposite the State Capitol. Herein are housed the historical records of the State of Minnesota.

Fort Snelling.

(by Auto or Street Car.)

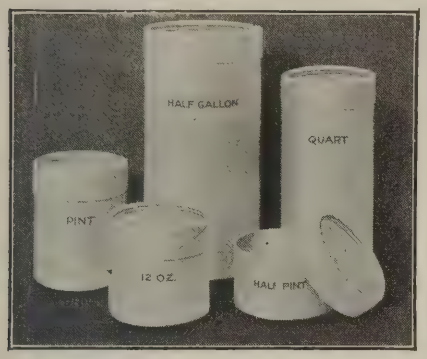
Situated on a high bluff at the junction of the Minnesota and Mississippi rivers this post which reaches back to the early days in American history, is of more than unusual interest to the tourist. Added to the natural beauties of its location, and the historical interest given by its old block houses are its present day activities.

Suburban Trips.

White Bear Lake, northeast of the Twin Cities, one of the beauty spots of the state, is easily reached by motor car over a boulevard highway or by trolly or train. Bald Eagle Lake immediately adjoins it.

Immediately to the north of the city, the country is dotted with beautiful small lakes which are made accessible by excellent highways. Along the banks of the Mississippi south of the city is a delightful road which takes one to Mendota, the oldest settlement in the state and the site of the famous Sibley House, the home of the Territorial Governor who became the first governor of the State of Minnesota. This house is now the property of the Saint Paul Chapter of the Daughters of the American Revolution, and one may spend a very interesting half hour going through it. The return trip to St. Paul can be made by crossing on the ferry to Fort Snelling and thence back down via the Mississippi River Boulevard and Summit Ave.

Twin City Parks.



Guests are more than amply repaid by visiting Twin City parks, so varied in nature and purpose that one can suit any whim or fancy whether it be merely a desire to see and enjoy the beautiful recreation for the children, canoeing, boating, bathing, or just rolling along winding boulevards in automobiles or strolling through wooded and secluded pathways.

Throughout the city proper—even in the busiest down town section there are many small parks where passers-by may linger on comfortable benches beneath cool shade trees while fountains play and musicians entertain. But at Como Park the visitor finds that nature and man have vied with one another to produce a lovely spot almost unequalled for rare beauty, real floral magnificance and aquatic splendor. Miles of hard surface boulevard wind round two picturesque little lakes and dip and rise over gentle hills and vales of trees, flowers, conservatories, zoological gardens and play grounds. At evening time canoes glide over the smooth surface of the cool lakes while people promenade beneath vine clad pergolas amid luxuriant flower beds. Truly the goddess of peace, contentment and beauty reigns supreme at Como.

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

Special Advertising to the Little Folks

By DAVID J. BUCKINGHAM, Advertising Manager, Manning Manufacturing Company, Rutland, Vermont

RIGHT at the start let me say that the reason for this is a "holler for help" on the part of the editor of The Ice Cream Review. The advertising is so big, he says, that there's got to be enough supplementary reading matter to make the Dairy Show and National Convention issue the big hit that it should be. First, he pleads, write us a message for our readers in which you tell why you support the National Dairy Show and emphasize its importance to the dairy industry. That's not such a terrible job!

Of course one of the big reasons why we support the National Dairy Show is because it means more business for us. Then too, it gives us a chance to step out for a couple of weeks and although we are generally kept pretty busy taking care of our exhibit we have a good time after all. But we're not wholly selfish about this. The importance of the show to the dairy industry lies in the fact that it keeps everybody up to date. The dairymen get together and exchange ideas; they see the various exhibits right there before them so that they can compare notes and get a better idea of which is really the best. The manufacturers realize this and just about break their necks trying to make their exhibits the last word in "class" and whatever else the buyers want,—and that keeps the manufacturers up to date. After all that's the kind of competition that every manufacturer of equipment with real merit likes to indulge in and we're not at all backward about saying that we're right up there with the rest.

Now to come back to the editor's "holler for help." Write us a message, he says to the readers of The Ice Cream Review. As an advertising man I'm naturally strong for an advertising message and I suppose that the readers of The Ice Cream Review are most interested in one that pertains to ice cream. To this end I'm going to tell about a brand new and most effective method of selling ice cream, which is fully described in the August 18th issue of Printer's Ink, the well known journal for advertisers.

Given a certain product to advertise the first thing to do is to discover what class of people to advertise to and then talk to them in their own language. Ice cream, says Printers' Ink, would seem at first sight to be a universal product, appealing to young and old alike. The Chapin-Sacks Corporation, which manufactures the Velvet Kind Ice Cream in 17 plants that cover a territory from Washington, D. C., to Jacksonville, Fla., has started a comprehensive campaign directing the appeal at the children, who, after all, are the biggest consumers of ice cream and who influence to a large extent the purchasing of the grown-ups.

In order to talk to the children in their own language the Chapin-Sacks Corporation has used "Mother Goose" and "Alice in Wonderland" rhymes in their ice cream copy, twisted so they fit into the Velvet kind campaign and actually sell the children on that particular brand of ice cream. In commenting on the effectiveness of this method Printers' Ink says: "Children can never get enough of their favorite characters and are always eager to follow their adventures still further. They regret the fact that the story of Humpty Dumpty ends with the unfortunate incident of the gross failure of the king's horses and the king's men. In the Chapin-Sacks advertisement they find out more about their favorites, but the rhymes have been changed so that ice cream becomes the dominant idea."

Here's the way one advertisement goes:

"Jack Sprat could eat no fat,
His wife could eat no lean,
But when they tried the Velvet Kind
They licked the platter clean."

While this style of copy cannot help but appeal to children, it is the illustrations that really put over the

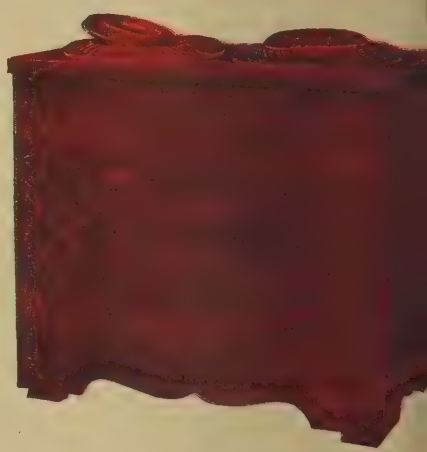
will save 65% of ice, salt and labor over any metal lined cabinet made, keep the cream uniformly hard (in which

CHARLES NELSON
The inventor and patentee of WOOD LINED Cabinets, is a veteran ice cream man, having for years had charge of the largest ice cream plant west of the Mississippi River.

A Test



ON THE month of August we made a test of the ICE-keeping qualities of our cabinets. We put 50 pounds of manufactured ice in a 20-quart bulk cabinet. The temperature of the room varied from 90 to 98 degrees, and it required 5 days and 4 hours, or 124 hours, to melt all the ice; temperature of water remained at 42 degrees for several hours after the test. This is the best known way to test the ice-keeping qualities of any cabinet. No other cabinet has equaled this test.

We invite competitive tests

Uniform Temperature

The ice cream is always kept in a uniform condition, as the circular Ice Chamber allows an equal distribution of ice around the can.

The Nelson is the only cabinet that will keep ice cream in perfect condition where Electric Fans are used. Red Wood being a non-conductor, it does not convey the warm air to the inner compartment or allow the cold air to escape and thereby cause condensed moisture (sweating) on the outer case as a metal cabinet will.

Two Compartment

A Full Can Always in Reserve

This Proposition

Any responsible ice cream manufacturer — particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

One Compartment, Insulated with Granulated Cork, Built of Everlasting Redwood.

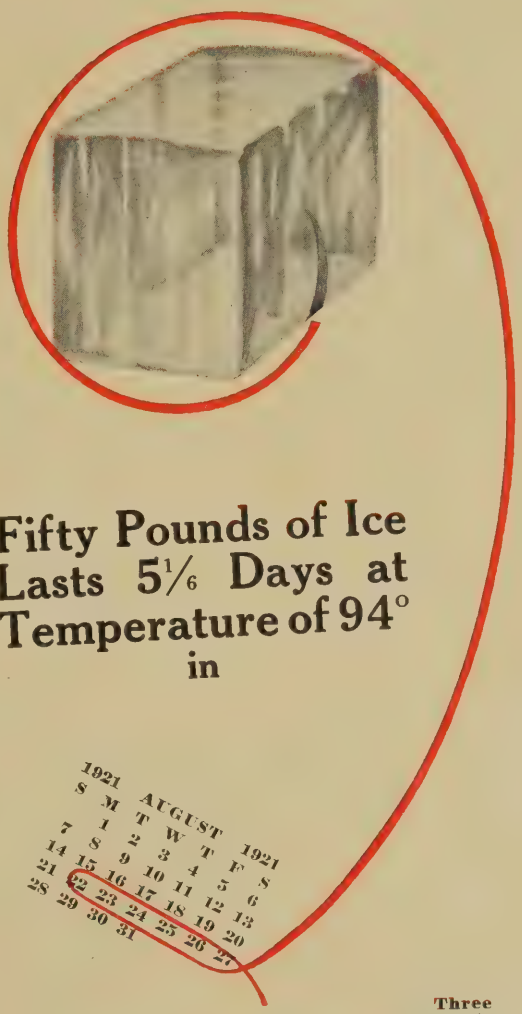
C. Nelson Brick Cabinet

Construction



The Nelson Patent Cabinets are constructed entirely of wood. Everlasting California Red Wood used for the outer case, and White Cedar for the circular independent compartments. The compartments are separated from the outer walls and from each other by granulated cork (the best non-conductor of heat and cold known). Drain pipes are of heavy brass tubing and secured by brass locknuts. Both are everlasting. Great care is used in selecting the lumber and other material that go into these cabinets. Our object is to build the best.

Life

Cabinets sold in the spring of 1899 are still in use, giving satisfactory service.

Finish

All stock cabinets finished in a Rich Mahogany Color, two coats shellac, two coats of special brine-proof varnish. Other colors on order only.

Seventeen Big Conventions Dairy Show Week

From Northwest Development Committee.

Seventeen big conventions allied with the dairy industry will be held in St. Paul and Minneapolis during the period of the National Dairy Show at the Minnesota Fair Grounds, October 8th to 15th.

In making this announcement, William E. Skinner, general manager of the Dairy Show, declared that he had just received official notification from Eben E. McCloud, of the Western Passenger Association, that an open rate of a fare and one half for the round trip had been authorized for the National Dairy Show from the following territory to St. Paul or Minneapolis.

Northern Peninsula of Michigan, Wisconsin, North Dakota, a portion of Montana, South Dakota, east of the Missouri River, Iowa on and north of the Illinois Central, Sioux City to Dubuque.

Fare and one half on the regular certificate plan for the conventions of allied organizations also was authorized under the same ruling. The conventions to be held in the Twin Cities during the big educational exposition are:

National Creamery Buttermaker's Association.
National Dairy Association.
International Milk Dealers' Association.
National Association of Ice Cream Manufacturers.
National Conference of Co-operative Creamery Men.
National Dairy Council.
American Jersey Cattle Club.
American Guernsey Cattle Club.
Holstein-Friesian Association of America.
Ayrshire Breeders' Association.
Allied States Creamery Association
North Central States Association of Dairy and Food Officials.
Wisconsin State Cheese Association.
Wisconsin Dairy Protective Association.
Brown Swiss Cattle Breeders' Association.
Minnesota Creamery Butter Manufacturers' Association.

County Agents, State Extension Service and Railway Agricultural Department Men.

"The action of the railroads in giving reduced rates for the National Dairy Show and the seventeen big conventions to be held in the Twin Cities during the period of the Show ought to bring half a million people to St. Paul and Minneapolis," said Mr. Skinner.

"Plans for big excursions of farmers from most of the counties in the Northwest states already are being made. Delegations are coming in automobiles from many counties in Minnesota and Wisconsin, flying banners advertising their counties, and with the delegates wearing badges which will identify them when they mingle with the leaders of the dairy world who will be at the Dairy Show and in attendance at the conventions. Other delegations plan to come by train. I look for this exposition, of such vital value to the farmer, held in the northwest for the first time, to be the best attended in the history of the National Dairy Show."

DIPLOMACY.

Newlywed—"You know, I don't know what to call my mother-in-law. I don't like to call her 'Mother' and yet I can't very well call her 'Mrs. ————.' What did you do?"

Experienced Husband—"Well, I called mine 'Say' for the first year, and after that everybody called her 'Grandma'."—Voo Doo.

Ice Cream Mix Made by the Vacuum Process

By JULIUS J. MOJONNIER. Secretary Mojonnier Bros., Milk Engineers

FOR some time we have been at a great expense experimenting with our method and process of preparing a uniform mix under vacuum. Now that this method is fully developed and thoroughly tested and proven we have taken the necessary steps to protect our method and process by United States Letters Patent. We are now prepared to grant license for the use of this method and process and supply and install equipment for carrying out the same.

It has been the aim of our company from the start to develop methods and equipment that will enable the ice cream manufacturer to improve his product thereby increasing his sales and at the same time decrease his manufacturing costs. From day to day the public is demanding a better ice cream and at the same time the consumer is anxious for lower prices. To keep pace with this demand it is necessary for the ice cream manufacturer to study every available means of improving his product and at the same time keep down his costs. We are greatly pleased to be able to be of material assistance to the ice cream manufacturer in helping him accomplish both of these results.

During the past year a great many very successful installations have been made using the Mojonnier process for making ice cream mix which has been made possible by equipment of our own special design. It is a well-known scientific fact that the acids in butter that cause rancidity and off-flavors can be eliminated by boiling under vacuum. It is almost impossible to buy raw materials, which at some time, do not have slightly off-flavors. When made into ice cream these give a product not entirely satisfactory to the consumer. By preparing the mix under vacuum these flavors can be eliminated.

We would not recommend that cheap, rancid butter be used in making ice cream mix, but with this process it is possible to use butter or other milk products without any ill effects that is absolutely impossible under any other process. When mix is made in the Vacuum Pan we find that overrun is much more easily obtained in the freezer. Furthermore, by this method there is absolutely no danger of heating the ice cream to a temperature above the pasteurizing temperature, namely, 145 degrees F. This eliminates absolutely any cooked flavor and gives the mix a fine, fresh taste.

Wherever possible we recommend that the mix be made under vacuum using fresh milk and sweet butter as a source of solids not fat and the fat in the ice cream. Fresh cream can be substituted for sweet butter if preferred.

With this method the fresh milk is received and stored in a glass lined jacketed tank. From this tank a measured quantity is run into the hot well. Here it is tested accurately for butter fat and solids by means of the Mojonnier Milk Tester. From these accurate tests the proper amount of butter fat, sugar and gelatine is added to the hot wells. After heating this mixture to the proper temperature in the hot wells it is drawn into the Vacuum Pan, condensed down to the specific gravity that gives the proper amount of butter fat, solids not fat, sugar and gelatine to make a standardized ice cream mix. From the pan the ice cream mix is dropped into the weigh tank where a sample is taken and again tested upon the Mojonnier Tester for butter fat and total solids. Water is added to the mix at this point to standardize it to exactly the point desired.

From the weigh tank the mix is viscolized or homogenized and run over a surface cooler from which it is pumped into the holding tanks. This is continued until the total amount of ice cream mix is prepared for the days run.

When there is a surplus of fresh milk above that required for making the regular run of ice cream mix, this can be converted into bulk whole sweetened condensed milk. This product may be stored and held for future use. If too great a surplus is accumulated, some of it may be sold to candy manufacturers, bakers or to other ice cream manufacturers.

By storing this product in a bonded warehouse, the cost of holding is only the interest upon the investment plus the storage cost. With the present low cost of sugar there is no means by which milk products can be stored for future use or for marketing as unsweetened condensed milk.

Actual savings in dollars and cents is brought out more specifically in the two tables below:

Mix No. 1—Prepared in Pasteurizer.

(Chicago Wholesale Market Price.) July 26, 1921.

Raw Materials Used	Pounds	Price per Cwt	T't'l Cost
20 per cent cream	208	$11.86	24.67
Fresh Milk	324	3.47	11.24
Bulk Whole	...	....	....
Condensed	237	8.99	21.31
Sugar	126	6.00	7.56
Gelatine	4.5	70.00	3.15

Total cost of 100 gallons ice cream mix when raw materials are bought wholesale is $67.93.

Mix No. 2—Prepared by Mojonnier Vacuum, Cond. Process.

(Chicago Market)

Raw Materials Used	Pounds	Price per Cwt	T't'l Cost
Fresh Milk	1105	$ 2.45	27.09
Sweet Butter	40.2	40.00	16.08
Sugar	126	6.00	7.56
Gelatine	4.5	70.00	3.15

Total cost of 100 gallons ice cream mix when fresh milk is bought direct from farmers and sweet butter in open market is $53.86.

$2.30 per 100 lbs. plus 15 cents per cwt. for hauling.

This represents a saving of $14.07 on every 100 gallons of mix.

Gross saving upon 500,000 gallons ice cream yearly ,$35,175.00.

Less one per cent per gallon for receiving and condensing operations above cost of pasteurizing, $2,500.00.

Net saving per year, $32,675.00.

Making ice cream mix from fresh milk and sweet butter works especially well in smaller towns so situated that milk may be hauled directly to the city by farmers. Plants making as little as fifty to one hundred thousand gallons of ice cream per year can easily afford to use this method both on account of the improved product produced and the cash saving effected.

In the cities we recommend that the Mojonnier Vacuum Condensing Unit be installed directly in the ice cream plant so that all the mix can be pasteurized under vacuum. In the city it is possible to make arrangements with condensing plants in the country to ship their whole fresh milk or skimmed fresh milk condensed four to one to the ice cream plant. This will supply all of the solids not fat in good fresh form and a large part of the butter fat. The balance of the butter fat can be bought upon the local market as needed in the form of sweet butter. The whole mix is then run through the Vacuum Pan. The proper amount of water is added so as to get the mix to the right standard for butter fat and total solids. In this case the Vacuum Pan is used as a vacuum pasteurizer and it affords a positive means for removing any off flavor from the product.

In the city it is also possible to haul fresh milk in a tank wagon, tank car or on a truck with cans from a receiving and cooling station in the country and make all of the mix from fresh milk and sweet butter.

The ice cream manufacturer in the city has a further advantage of being able to buy sweetened skim condensed milk or any other product in which the butter fat and solids cost the least money in making up his ice cream mix. By making the mix in the Vacuum Pan he can be sure that every batch of ice cream that he makes will be of the same uniform high quality. In the city the fresh milk dealers usually have a large amount of surplus skim milk. This product can be used for making the mix. The full quantity can be purchased at a very reasonable figure, condensed down with sugar and held in storage until a time of shortage.

NEW YORK PHILADELPHIA CHICAGO ST. LOUIS SAN FRANCISCO

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

method, we present herewith a list of operations necessary to make a mix by the old method as compared with the new.

In making mix from cream, fresh milk and whole condensed milk, it is necessary to carry out the following operations. Each one of these necessarily costs money.

Cream—Fresh milk received, milk is skimmed, cream pasteurized, tested and standarized, cooled, put into cans, stored, delivered to the ice cream plant.

Fresh Milk—Fresh milk is received, pasteurized, cooled, tested, put into cans, stored, delivered to the ice cream plant.

Bulk Whole Condensed—Received, condensed, cooled, standardized, put into cans, held in storage, delivered to the ice cream plant.

The Ice Cream Manufacturer—Holds milk products in storage, tests the cream, tests the fresh milk, tests the whole milk for butter fat and solids, mixes milk products with sugar and gelatine, pasteurizes, homogenizes, standardizes mix for butter fat and total solids, cools, holds.

With the Mojonnier method we have the following operations—Milk received, tested, standardized, heated to 140 degrees in the hot well, condensed, weighed, standardized, homogenized, cooled, held in holding tanks ready to freeze.

32 operations in old method. 10 operations in new method.

The advantage of this method—(1) All of the solids not fat and most of the fat may be obtained from fresh milk which offers the cheapest source of supply.

(2) The method provides a positive means of pasteurizing the mix that helps to produce a better flavor. This cuts down the bacteria count and produces a better, cleaner flavored product.

(3) It makes it possible to produce an accurately standardized ice cream mix, that will be uniform from day to day.

(4) It makes it possible to buy milk from a certain number of farmers every day and all surplus can be converted into sweetened condensed milk. Products that can be easily stored and held until the time of shortage. This insures a high quality of ice cream mix for every day in the year.

(5) Ice cream mix made in this way produces a better overrun, a better product and more profit.

HAVE A THOUGHT FOR THE ROAD.

By M. L. Pulcher, Vice-President and General Manager Federal Motor Truck Co.

Motor truck operators must have a constant thought for the road and its traffic limits in order to avoid further anti-truck legislation.

One of the lagest office buildings in the world was recently erected in Detroit. An immense amount of yardage of earth had to be removed quickly. Result, contractors insisted on every truck hauling an overload. Three and one-half ton trucks carried five or six tons. Five and six ton trucks were forced to load to eight and ten tons. Result, the absolute destruction of about twenty blocks of heretofore adequate pavement on one street. No truck on this job was sufficiently tired for the loads they carried. So the pavement was pounded into debris in a few weeks. Result, a more drastic ordinance, but surprisingly fair in view of the destruction caused by the penurious contractors who were willing to spend the public's money for new roads and the truck owner's money for repairs to put a few dollars in their own pockets.

This story has been duplicated many, many times all over the country. The truck owner is not always wholly to blame although he is in the end responsible.

The comparatively few trucks on such jobs create a sentiment against all reasonable truck owners, and with city fathers, legislators, and congressmen so anxious to find objects of regulation—the result is often times unreasonable and frequently ruinous legislation against the motor truck.

It is time to be more thoughtful and less greedy. The commerce of the nation absolutely depends on motor truck transportation. Roads and bridges, happily, are being properly built and stengthened to carry the loads which good business demands of highway transportation. But it is high time for abuses to stop. Arrived is the moment to have some regard for our neighbors. There are other men, women and children depending on motor haulage for their living besides you and yours. There are little ones by the thousand who must have milk. If you dig a hole in the pavement or highway with your overload some one may demand that all trucks the size of yours be kept off the road. That may stop the milk supply or the fresh vegetables, or the coal or any one of a hundred other necessities that we must have continuously delivered.

Have a thought for the road. Remember your neighbor. Be fair — be reasonable, so that trucks will be fairly treated on the statute and tax books.

OF INTEREST TO DAIRY SHOW EXHIBITORS.

To the Exhibitors:

Mr. N. C. Tomkins, who is on the Publicity Committee of the Machinery Exhibitors' Association, has just written us a very splendid letter of the wonderful amount of interest that active moving exhibits are creating in the Pageant of Progress Exhibition in Chicago.

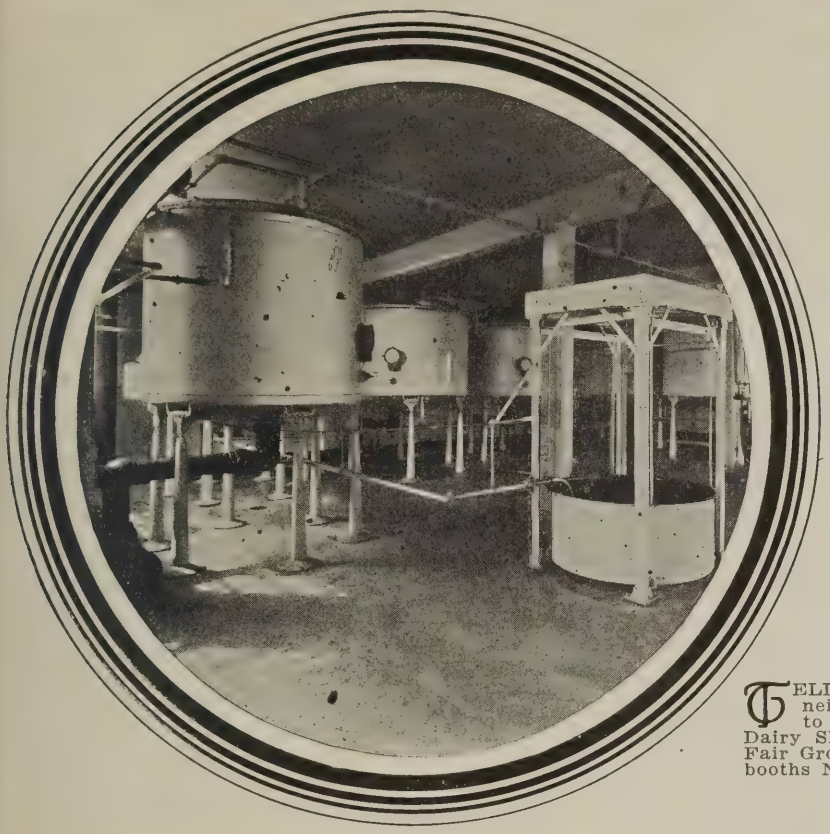
There is an inherent desire in the human mind to see the wheels go round and while all of our exhibitors cannot make their wheels go round because of the character of their exhibit, yet those who can would find an added attraction to their exhibit if they did in our Show.

You can perform your work of placing your exhibit this year with open shop labor. The rates for electrical work will be about half of what they were in Chicago last year and other labor charges correspondingly reduced. I presume you can get your motors for very much less than they would have cost you for the last five or six years.

We have made great progress in our exhibits and manner of showing and there is nothing to complain of in this connection, but I am offering this suggestion to all who desire to make their exhibit still more interesting in the Northwest this year.

You know we are some distance from either city with the Show with nothing to compete in the way of entertainment and the man who presents his case in the most attractive and interesting way, will undoubtedly get the attention of the people.

We will work along this line with you to make this the greatest Dairy Show yet held.



This year is the dairyman's opportunity in all lines. We are organizing the bankers, the creameries, the county agents, the country press, the lumber yards, the elevators, the cement interests, the breeders and the milk producers in every county in the Northwest States and if every exhibitor will utilize his influence with any of these factors in any country in which he may be strong, it will only tend to insure the result that we must get in the way of attendance. to make the Show of the greatest value to the dairy interests of this Section.

We now feel that with everyone keeping up to the mark on work in hand for the success of the Show, this should be the greatest Show yet held.

Therefore we want you to keep up your good work in every direction until the returns are all in.

Yours truly,

W. E. SKINNER,
General Manager.

IF YOU are traveling through New York State stop off at Rochester—217 Cutler Building, and we should like to show you through one of the most interesting plants in the world.—Or, call at any of our branch offices —1802 World's Tower Bldg., New York.—1442 Conway Bldg., Chicago,— 206 Sharon Bldg., San Francisco. If at London visit our British company, Enamelled Metal Products Corp., Ltd. Imperial Bldgs., 56 Kingsway, W. C. 2.—Or, in Australia, Mauri Bros. & Thomson, 123-131 Castlereagh St., Sydney. Please do not hesitate to communicate with our Main Office for any information on our equipment. Address: The Pfaudler Co., Rochester, N. Y.

TELL your friends and neighbors you are going to the World's Greatest Dairy Show, Minnesota State Fair Grounds, Oct. 8-15. Our booths Nos. 96-97-98.

EVERY dairy or ice cream plant has its own individual method of handling—and some such have proven to be very instructive. Out at the General Necessities Company, Detroit, the various Pfaudler Storage Tanks [shown at left and in rear of photograph] hold respectively sweet cream, condensed milk, etc. to be used in the making of ice cream.

All the tanks are connected to a common, sanitary pipe-line, which empties into a weigh tank [shown in the foreground]—the various constituents of the mix, being drawn off in quantities as desired.

This method is rather unusual, in that it eliminates entirely the use of a cold room, large numbers of cans, and the handling that goes with them.—It further saves a good deal of floor space.

It has been the pleasure of the Pfaudler Co. to have worked with General Necessities on this proposition—and with many other dairy and ice cream plants on similar projects, which have meant to them the saving of considerable money.

Perhaps YOU have a definite problem on your hands, as to just how you shall lay out your plant, and just what equipment would represent the most profitable investment for you.

Use your scissors then, on the coupon at the right—or call at our booth at the Dairy Show—or better still, do both.

This advertisement is the 3rd of a series designed to show the various points of superiority in Pfaudler Equipment and Service. The above installation is illustrative of the real engineering service which the Pfaudler Company is endeavoring to give.

Ice Cream — Plain, The National Dish

By Mr. HENRY W. STERN, Manager Ice Cream Specialty Department, A. Daigger & Co. Chicago

Unfortunately for the ice cream manufacturers throughout the United States, they have allowed the dealers to get in a rut, insofar as ice cream sales are concerned — hot weather sales pyramid the business, and it seems as though heat and ice cream are synonomous.

HENRY W. STERN

A co-operative campaign on the part of the manufacturers, in conjunction with their various dealers, to educate the mothers in the local community, to the benefits to be derived from the daily consumption of at least a dish of ice cream on the part of each child in the family, regardless of whether it is zero weather or ninety degrees in the shade, is something that can be worked out that is ultimately going to prove that "Ice Cream — Plain, is the Nation's Standard Dish." There is no question but that every medical authority in the country agrees that occasionally a straight milk diet for any person not only cleanses the system, but offers an easily digested and stimulating food that will build up the body tissues, the mentality and the whole physical being to a point beyond that obtained in a mixture of conglomerated foods picked at random, and eaten in haste.

The mere fact that ice cream is very cold, makes it necessary for the child to eat ice cream slowly, in the winter time, and this if anything enhances its value as a food product at that particular time.

At one time it was our suggestion to various ice cream manufacturers, that advertising inferring that eating of ice cream together with the drinking of hot coffee would stimulate the sale of ice cream in the winter time, and, while we still believe this is true and can be worked out advantageously in the sales campaign, at the same time it becomes secondary to the above mentioned outline.

So many things have been said in favor of the food value of ice cream, and these very things have been good, however, we have not overlooked, in the exploiting of sales, that the fellow who advances this same theory, in the meantime becames almost a land mark for his lack of initiative. However, it has been said that constant dripping wears away the hardest stone, and so it is we believe with a good thing, "Ice Cream —Plain, the Nation's Standard Dish" and the repetition of this very phrase is going to help make it a fact as well as in theory.

Those ice cream manufacturers who are patient enough to read this, if they happen to have children at home, can readily appreciate, how, if a mother was given to understand that the very fact that the weather is cold, and that the coldness of the ice cream of necessity made the child consume the ice cream slowly and hence benfit to a greater degree, we believe they would coincide with the outline as given, and possibly be influenced thereby.

We believe in a short outline by way of a descriptive pamphlet, which might call the attention of various mothers throughout the community to the fact that considerable time is given to the study of geography, mathematics, spelling, grammar, music and various other subjects, when the children are in the primary grades. The most important subject of all, "Dietetics," and the selection of the best combination of foods is given a place so far down on the list that it can almost be classed as negligible. As a matter of fact eating to-day as is done by the American public in general is of the "hit and miss variety," and it certainly is of more importance to the coming generation that they select the best food, than to be able to either spell or to write correctly, or to know about geography.

Further, if the subject of eating becomes one of importance as it should, ice cream of necessity must take its proper place among the more nutritious and and most desirable, as well as easily digested foods. We earnestly solicit every man who reads this to give this article more than passing thought. Rather mark it with your blue pencil, talk it over with your neighbor, and then later when concerted action becomes possible, bear in mind the fact that a good story bears repetition, and that ice cream and its food value and its many other merits is certainly a good story.

LENOX ICE PLANT READY FOR ACTION.

Mr. Harry Hays is in Lenox, Iowa, to install the ice manufacturing plant for the Lenox Ice and Ice Cream Company. Work has been progressing very rapidly during the past three weeks, in the erection and assembling of the new plant since that time, and soon Lenox will have real manufactured home made ice.

The Vilter Manufacturing Co., of Milwaukee, Wis., are the makers of this machine and it is of a ten-ton capacity every twenty-four hours. This machine is new and is said to be one of the best machines of its kind. The motto the manufacturers claim for this machine is "Crystal Clear Ice". Ice can be made the year round, day and night, and from what we are able to gather it will be working continuously the rest of the summer, day and night.

A home ice manufacturing plant is an asset to the community, and is something that few towns are fortunate enough to have.

THINK OF IT.

One quart of ice cream contains as much nourishment as 14 eggs. If your family numbered five and you should eat 14 eggs at one meal you would think you had had a good full meal, granted, of course, that bread and butter, and possibly a vegetable or fruit salad had been added. Just as much nourishment would have been provided with a quart of ice cream. You would enjoy the meal just as much and probably more, because there is more plesure found in eating ice cream than in eating eggs.

Ice cream will never supplant eggs in the family diet. They are both necessary—ice cream as much so as eggs—but for a balanced diet at all seasons of the year, ice cream is in a class by itself.—The Dairy Diet.

LET'S PULL TOGETHER !!

MANY of the largest ice cream manufacturers use Nordhem Connective Advertising year in and year out. Why?

They have found that when the manufacturer and the advertising service really *pull together* they can increase ice cream profits to a figure impossible for the manufacturer who pulls his advertising oar alone.

How the entire Nordhem organization pulls together for your benefit will be told you in answer to your inquiry.

Mr. E. B. Conliss
has been appointed Rocky Mountain & Pacific Coast Manager of the Nordhem Syndicate Department, with offices at 424 Security Building, Los Angeles, California. Get in touch with him for sales ideas and ad suggestions.

MEMBER THE ASSOCIATION OF ICE CREAM SUPPLY MFR.

Milk Production in 1920 About 90,000,000,000 Pounds

Annual Statement Shows Output to be Nearly That of 1919 — Utilization of Milk also Shown

THE total production of milk in the United States for 1920 is estimated at 89,658,000,000 lbs. in the annual statement compiled by the Bureau of Markets and the Bureau of Animal Industry, U. S. Dept. of Agriculture. This amount is practically the same as for 1919, the production for that year having been placed at 90,057,500,000 lbs. The production of milk was decreased from 100 gals. per capita in 1919 to 98 gals. (848 lbs.) in 1920. There was a decrease in the number of milk cows in the country during the year. According to the Bureau of Crop Estimates, there were on farms 23,619,000 milk cows on Jan. 1, 1920, and 23,321,000 on Jan. 1, 1921, a decrease of 298,000. The number of cows other than on farms was estimated as 1,400,000 for 1919, but for the year 1920 the number was prorated from census figures as 1,200,000.

Per Capita Consumption.

The consumption of fluid milk fluctuated during 1920. In the first part of the season there was an abundance of milk and the consumption was larger than that of previous years. However, during the period of industrial depression that marked the closing days of 1920, milk consumption rapidly decreased, though this decrease was partly offset by the milk campaigns carried on throughout the country and which greatly increased the consumption in the territory covered. The estimate of the population of the United States as used in the annual statement covering 1919 was too high, as shown by the returns of the late census. But when the quantity of milk used for household purposes in 1919 is divided by the correct population figure the consumption of milk for 1920 is shown to be the same as for 1919, i. e., 43 gals. per person.

The amount of milk used in the manufacture of oleomargarine was estimated this year from data received from the factories and shows a decrease in the proportional amount of whole milk used. The quantity of milk and skimmed milk combined, as now used, is practically equal to the quantity of whole milk formerly used. However, in the manufacture of nut margarine, whole milk is not used in the same proportion as in the regular oleomargarine.

This year original data were received from the factories relative to the quantities of milk used in the manufacture of milk chocolate and, while complete reports were not received, the quantity shown in the table was prorated from these reports and is very conservative.

The production figures for ice cream are estimates. The figures for 1920 show an increase in production of 13% over 1919 based on factory reports received by the U. S. Bureau of Markets. Calculations were made on the basis of 13.75 lbs. of milk per gallon of ice cream for 1920 and 15 lbs. for 1919. The latter figure was based on the "batch" method of manufacture only. Ice cream made by the continuous machines weighs

Production and Uses of Milk in the United States, 1920 and 1919.

Product	1920				1919		
	Milk used per unit of product	Quantity of product manufactured[1]	Total whole milk used	Per cent of total milk	Quantity of product manufactured[1]	Total whole milk used	Per cent of total milk
	Pounds	Pounds	Pounds		Pounds	Pounds

[1]Figures for manufactured products for both years are from reports to the U. S. Bureau of Markets; other figures are estimates based on surveys, etc.

[2]Including 6,300,000 lbs. of farm cheese.

[3]A large proportion of skim milk is also used. The figure used in 1919 (0.23 lbs.) included some of this.

[4]A large part was made from milk powder, condensed milk, etc.

[5]Batch-made ice cream weighs 6 lbs. per gal., and continuous machine made ice cream weighs 5 lbs. per gal., averaging 13.75 lbs. of milk to make, rather than 15 lbs. as calculated for 1919.

[6]Reports show 13% increase over 1919.

[7]Gallons.

[8]Population in the 1919 statement was estimated at 106,700,000.

[9]Pounds.

[10]Figuring 5% slaughtered at once, and 85% fed. Calf crop 90% of cows.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS

The continued use of C.W. Brand Vanilla gives that peculiar satisfaction and pride that comes only with the knowledge that the vanilla flavor in your ice cream is as good as it is humanly possible to make it.

The continued use of C.W. Brand Vanilla gives your ice cream a character and individuality that is easily distinguished from ice cream flavored with the ordinary vanillas.

If your ice cream *tastes better* than your competitors', it must *be better*. This is the logic of the ice cream consumer. C. W. Brand Vanilla is as good as it is humanly possible to make it and is bound to make your ice cream sell better because C.W. Brand Vanilla will make it taste better.

The Widlar Company of Cleveland, Ohio, who manufacture C.W. Brand Vanilla will be glad to show you that your ice cream really can be made to taste better.

less per gallon. The quantity made by the continuous method was large enough to warrant the use of 13.75 lbs. per gallon for the year 1920.

The total calf crop for 1919 was estimated at 80% of the number of cows. Data compiled more recently from a number of representative States indicate that the estimate was too low and that the calf crop was 90% of the total number of milk cows. The number of calves slaughtered at birth, and the number vealed are estimated from data obtained from the principal markets, census reports, and reports of the U. S. Bureau of Markets.

In a comparison of the figures for 1920 and 1919 a decrease is noted in the quantities of milk used in the manufacture of butter, cheese, condensed milk, powdered cream, and oleomargarine. An increase is shown in the quantity used for whole milk powder, malted milk, sterilized milk, ice cream, and household purposes.

POWDER PLANT AT WAUKON, IOWA.

Take a can of it off the pantry shelf, empty the cream-colored powder contents into a milk crock, add water and set in a cool place over night. The next morning there will be rich cream on top all ready to be skimmed off for the coffee and oatmeal. It will taste just like cream—it will be cream just the same as though it had been raised on milk fresh from the cow the evening before. Put some of the cream in a churn and you can churn butter from it, yet the can of powder may be a year or more old.

This is the product which is being put on the market by the powdered whole milk factory of D. J. Murphy at Waukon, Iowa. The factory began doing business three weeks ago.

For fifteen years concerns here and there throughout the country have been producing powdered skimmed milk, but every effort to devise a method of reducing whole milk to powder without breaking up the fat globules had failed. "It can't be done" was the verdict of scientific men. Then a couple of years ago Dr. S. M. Dick, a Minneapolis chemist, accomplished the impossible—a powdered milk with fat globules intact—by simply letting gravity do the work instead of subjecting milk in the powdering process to high pressure which breaks up the fat globules as was the practice before. The result is a whole milk, all there but the water, and nothing else with it.

The invention has been patented and the patents now are the property of the International Dry Milk Company of Minneapolis and St. Paul. Dr. Dick is a director of the company. The officers are: President, J. E. Burchard; vice-president, F. A. Griswold; secretary, Howard Everett; treasurer, A. B. LaDue; chemist, R. V. Washburn, former head of the agricultural college of the University of Minnesota. During the last year and a half the company has been fostering the establishment of factories to make the product, granting rights to use their patented process to companies on a royalty basis. Two factories have been opened in Canada, one at Gananoqua, Ontario, and the other at Chilliawac, British Columbia. Three have been established in Wisconsin, at Mayville. Alma and New Richmond, and now a first one is opened in Iowa at Waukon. The president of this last concern is D. J. Murphy, banker and lawyer at Waukon and brother of D. D. Murphy, president of the Iowa board of education. His son, R. Murphy, is manager. The plant the company has established is similar to the Canadian and Wisconsin ones, though not so large as some of them. The building of tile reinforced concrete, with its equipment represents an investment of $75,000. The plant as soon as it gets into full operation will consume 100,000 pounds of milk a day and produce 11,000 pounds of powdered milk. Farmers for quite a territory around Waukon will sell to the factory.

It requires not more than twenty minutes to convert the raw milk into powder. When the milk is delivered at the factory by the farmers it is weighed and run through a clarifier which removes all dirt particles. From the clarifier it passes into cooling coils and from the coils into a glass-lined tank where it is thoroughly cooled by refrigeration. The chilled milk is then pumped to the top of the building into a cell where it falls through a shaft on to eight discs revolving at the rate of 4500 revolutions a minute. As it is sprayed into the cell from the disc, hot air currents act upon it, completely dehydrating the milk in twenty seconds. The powder resulting drops like a snowstorm to the bottom of the cell. The water from the milk goes out of the top of the building through exhaust pipes.

The milk powder is taken out of the bottom of the cell as fast as it falls is sifted and aerated and then packed in barrels and cans. The canned powder keeps on store shelves and cupboard shelves without deterioration for many months, the International Dry Milk company claims they have proved by tests made over long periods in climatic conditions in all parts of the world.

—Elkader, Iowa Register.

TRIPLE COMBINATION OF KLEINHEINZ DAIRY COMPANY IS PROSPEROUS.

The plant of the Kleinheinz Dairy Company, Wausau, Wisconsin, has been in operation a little over a year, having started in business the latter part of July, 1920.

From the start business was good and their ice cream was of such a superior quality that it soon advertised itself, and good sales were realized.

New equipment has been added continually to meet the steady increase of business and now the Company has a 60 quart and a 40 quart U. S. freezer, which gives a capacity of 100 gallons per hour. The plant is also equipped with a 300 gallon Cherry mixer, a viscolizer, cooler, etc., a York 10-ton compressor and two hardening rooms of 1500 gallons capacity each, are other assets of the company.

This summer's business has been running from 300 to 700 gallons per day and almost double this amount on holidays.

Their main business is the city milk supply trade which is conducted in an adjoining building. There they have a most complete plant for pasteurizing milk and cream for the city trade.

The company also manufactures butter to supply their trade. Last fall they purchased the Church Hill cheese factory, which is about five miles from the city of Wausau, and this place is used as a reserve supply station to supply both the milk plant and ice cream plant with sufficient milk and cream when needed. All the surplus milk is manufactured into full cream cheese.

Their triple combination of city milk plant, ice cream plant and cheese factory works out to excellent advantage, as all their surplus milk is disposed of with a profit.

Don't miss a single copy of The Ice Cream Review. We'll see that you do not if you send us two dollars for a year's subscription.

38 Lbs. of

SNOW DRIFT SKIM MILK POWDER

+ 62 Lbs. of

GOULD'S OWN BRAND SWEET BUTTER

=60 Gallons 10% Sweet Cream

IN PREPARING your ice cream "mix"—instead of using liquid milk—try this. To 38 pounds of Snow Drift Skim Milk Powder, dissolved, add 62 pounds of Gould's Own Brand Sweet Butter. This makes 60 gallons of 10% sweet cream—which insures a smooth delicious ice cream absolutely velvety.

In hot weather, when milk sours easily and deliveries can't be depended upon, if you use Snow Drift Skim Milk Powder, you'll be prepared to meet the heavy ice cream demand and get your share of the season's profits. Snow Drift Skim Milk Powder is made from the finest fresh milk and won't cake in the barrel or develop a musty odor because it's made fresh every day. Packed for shipment in 180 to 225 lb. drums—carlots or less.

When You're in Minneapolis for the

1921 National Dairy Show

AND

1921 Annual Convention

NATIONAL ASSOCIATION OF ICE CREAM MFRS.

Let Us Show You Why Gould Products Make Better Ice Cream

WE'D LIKE to have you drop in our office when you're in Minneapolis for the Dairy Show and the Ice Cream Manufacturers' Convention and let us show you how Snow Drift Skim Milk Powder, Golden Key Brand Evaporated Milk, and Gould's Own Brand Sweet Butter will not only improve the taste and texture of your ice cream but also lower your production costs.

Only the finest dairy products are used in the manufacture of Gould products. They are tested in an up-to-date laboratory by expert chemists and are guaranteed to be fresh, uniform, and conform with Federal standards. We will be glad to quote you prices and arrange deliveries to suit your convenience.

"1921 Will Reward Fighters"

By P. PETERSEN, Coster-Petersen Company, Chicago, Ill.

It is with pleasure that we submit our little contribution with best wishes for the success of the National Dairy Show of 1921. The officers and leaders, who, through tireless and unselfish work, have made possible this great event of the season deserve our appreciation and undivided support. Never before in the history of dairying has there been a more urgent need of whole-hearted boosting and sincere loyalty to our great industry than at this time.

P. PETERSEN

We are optimists and believe in the success of our industry — that 1921 will reward fighters and that the coming year will be even more prosperous for the dairy industries than the years past. In these troublesome times when the world seems at edge and unrest, and dissatisfaction reigns, our country is looked upon as a leader among nations. It is up to us to prove the success of our constitution. Co-operation and combined effort in the proper direction is the only solution to our problems. In order to co-operate, we must have explicit confidence in each other, which can be established only through faithful service and square dealings.

The National Dairy Show is a demonstration of what can be accomplished through co-operation. Let us therefore heed the lesson and learn to serve the best interests of the dairy industries, each one in his respective place, that we may deserve the faith and confidence of our fellowmen and in turn reap the profit and satisfaction from work well done.

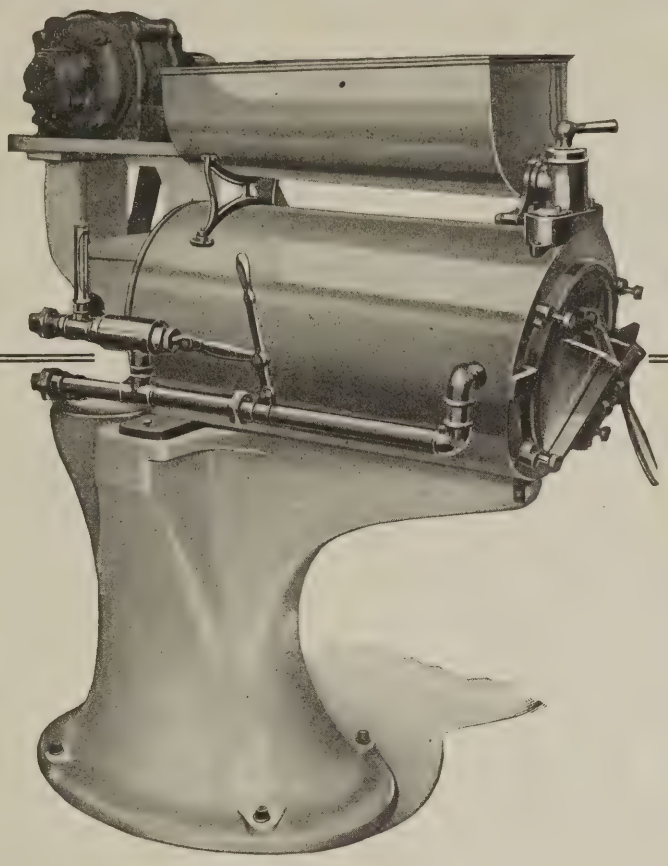
The Coster-Petersen Company is a recent incorporation, and while the individual members are well known, our company is unknown to many of you. Being a new concern, we are unable to do things that we would like to do. For instance, you may look for us in the list of exhibitors and fail to find the name of our company, but **we will be there.** You will find our apparatus exhibited in the booth of the Jensen Creamery Machinery Company, which company are the exclusive distributors of our line in the Eastern and Western territories. We are pleased to announce that we represent the Jensen Creamery Machinery Company in the Central States, and are as proud of selling the Jensen equipment as we are of our own line. Next year we hope to have our own exhibit for, incidentally, we believe in the right kind of advertising, and among the best media National Dairy Show.

The policy of the Coster-Petersen Company is to give the best possible service to the dairy industries, to be fair to our competitors and always ready to boost a good cause. We aim to give our customers the benefit of savings through quantitive production, but will not lower the high standard of our equipment in order to meet competition.

We are offering the manufacturer the Petersen Culture Cabinet, a combined sterilizer and incubator for pure cultures used in the manufacture of butter, buttermilk, cheese and for ripening ice cream mix. This cabinet insures complete sterilization of the milk media as well as temperature control during incubation. (Patents allowed by the U. S. Patent Office on June 17, 1921,) also Petersen's Ice Cream Gain Indicator (patents pending) which is a simple and reliable device for determining freezing gain or overrun in ice cream. This tester is of exceptional value as a means of checking freezer efficiency and controlling freezing gain. The price is within reach of the smallest manufacturer. We would welcome an opportunity to demonstrate these apparatus to you at the National Dairy Show.

Last, but not least, we want to urge you to attend the sessions of the National Convention. This is a wonderful opportunity to gather information on various subjects pertaining to the manufacture of dairy products, as it brings together men from the various parts of the country who are ready to exchange views and relate their experiences. The convention is also supported by the authorities from all over the country who are giving their service for the benefit of the manufacturer. Don't fail to derive the benefit from the educational features of the National Dairy Show.

MEET us at the National Dairy Show, Minnesota State Fair Grounds (Twin Cities) October 8 to 15, 1921



CHINESE FOND OF U. S. ICE CREAM.

Canadian papers report that a new export outlet has been discovered by American and Canadian manufacturers who are shipping, with almost every steamer, thousands of gallons of ice cream to China in containers holding about 500 gallons.

This development of the ice cream trade was revealed in the course of an investigation to discover whether the prohibition era, and the subsequent coming of moderation, had in any way affected the sales of ice cream and soft drinks. As far as could be learned the effect, if any, has been negligible.

Although the Chinese are now showing great partiality for ice cream, the Japanese do not regard it with favor, and positively will not consider soft drinks. But beer is getting a strong hold in Kobe, Tokio, Yokohama and other important Japanese centers, according to G. Reifel, a Vancouver brewer, who has been spending several months in the Orient.

Sake, for centuries the national drink of the Nipponese, is being more and more forsaken by the Japs, who are encouraged by the Government to drink beer in place of the native liquor, which contains 15 per cent alcohol, and which, according to some authorities, had not a little to do with the Japanese being of small stature. Most of the beer is manufactured on the island, the annual output being estimated at 3,000,000 barrels.—Pittsburgh (Pa.) Dispatch.

Good Ice Cream

The finer and more particular likeness for Good Ice Cream instinctively turns to the finer and smoother bodied Ice Cream. That is why so many ice cream producers in this and other countries use Emery Thompson open circulating brine base freezers.

The Ice Cream made on an Emery Thompson is easily distinguishable for its fineness and choiceness of ice cream flavor.

Right at this time can assure prompt delivery.

Please let us send you catalog

A Unique Service to the Ice Cream Industry

By H. SCHLOTTHAUER, 140 W. Kinzie St., Chicago, Ill.

THE present day expansion of the ice cream business—the graduating of the small ice cream man from the tub freezer to the brine freezer; and from one brine machine to a battery of machines; the need for larger mixers, ice making equipment, homogenizing machines, and so on, has opened for the smaller commercial man an avenue to savings that he should not overlook. The effect of all these changes has been to place on the market USED machinery that is NOT WORN OUT machinery—machinery that has merely become too small for the increased business.

It is not our feeling that it is good business to buy used machinery. We feel that, wherever a man can afford it, he should buy needed equipment of the very finest make. Trade expansion, however, uses up capital so rapidly in the form of tubs, cabinets, cars, advertising, etc., that, quite frequently, little is left when it becomes necessary to increase the capacity of the manufacturing plant itself. When the ice cream manufacturer is confronted with this problem he can frequently solve it by picking up used equipment at a fraction of the cost of new machinery.

The Ice Cream Review lists in each issue, in its Classified Columns, equipment of this nature. Human nature, however, makes it almost impossible for the seller of used machinery to see any but the good points of the equipment offered. The seller remembers the cost of the equipment and tries to get as much out of it as he can. The temptation to over-praise the machine offered is almost too great to be resisted, and the glowing descriptions should, in many cases, be taken with a grain of salt. The date of the manufacture of the equipment should not have an undue bearing in determining the condition of the machinery offered. We have all seen instances of—say automobiles—that have been in use one season that are in poorer condition than others that have seen several years of service—due to careless handling, lack of proper lubrication, etc. A freezer that has been overworked and carelessly handled is, after a season or two, in worse shape than another that has seen five years of proper service with proper attention.

In the manufacture of ice cream, as a general rule, low speed equipment is used. Our freezers, mixers, crushers, can washers, etc., revolve slowly. With care, therefore, the life of this equipment is indefinite and we should not be too greatly prejudiced by the date of manufacture. The writer recently looked over a used freezer, manufactured in 1905 and offered at a ridiculously low price. This freezer had been in service a few months each season, being carefully greased and covered the balance of the year. This freezer was, in his opinion, a better buy than another of the same make with but two season's use, that a Chicago manufacturer wanted to dispose of at four times the price.

It is the writer's business to call on the ice cream trade in the Middle West soliciting retinning business, can, freezer and tub orders, etc. In visiting around he makes it a point to inquire whether his customer has any equipment to dispose of. If any equipment is offered, he looks it over very carefully, giving particular attention to the gears, bushings, alignment, and any other points that affect the satisfaction the machine may give in the future and to determine how it has been cared for in the past—regardless of how nicely it may have been painted up for re-sale. The very lowest price the seller will accept is ascertained, if, in the writer's opinion, the machine is in good condition. The machine is not bought—the writer undertakes to help dispose of the equipment, adding a nominal commission for his service in bringing the buyer and seller together. The buyer gains, for he has the unbiased opinion of the writer who has actually inspected the machine offered, and whose commission is too small to induce him to misrepresent — the seller also gains through having his machine put before any prospective purchasers in a true light, and a deal follows through this personal element that would otherwise be absent.

We repeat—buy new equipment and the very best quality if you have ample funds; but do not lose business when you can buy first-class used equipment and cannot afford the new. The writer will be happy to serve you in this connection.

OLYMPIC ICE CREAM COMPANY'S NEW BUILDING BEING SHARED BY PIERCE COUNTY DAIRYMEN'S ASSOCIATION.

The official opening of the new home of the Pierce County Dairymen's Association in the new building just completed by the Olympic Ice Cream Company, at a cost of $50,000, has been held. The new plant is not completely enough equipped to care for the entire dairy output available to the association plant, and the fresh milk is being handled at the Yelm, Wash., plant of the Olympic Ice Cream Company, according to O. R. McKinney, president of the association.

The establishment of a wholesale house and factory in Tacoma, Wash., is a new departure for the association. In the past it has been the practice of the dairymen to do their manufacturing at the Roy Creamery. Recently this plan was shifted and, while the new building now being occupied was under construction, the dairymen did all their manufacturing at Yelm.

All the milk produced in Pierce county could be handled in the new plant, Mr. McKinney said. The association has 340 members which represents a large part of the industry in Pierce county. The members of the association are not compelled to sell to the organization but the organization keeps in the competitive field.

The new structure is a brick building, one story high on a concrete foundation 60 feet by 200 feet in dimensions. One-half of the building is to be used in the factory and office quarters of the association, while the remainder will be reserved for the company owning the building. The Olympic Ice Cream Company, of which Joseph Falco is manager, is planning on constructing another unit the same size and capacity as the one just completed.

The company's dairy plant now being operated at Yelm is to be moved at once to the new building. Preparatory to constructing the new plant the company began the drilling of a fresh water well six months ago. The well is now down over 500 feet deep but the flow of water sought has not been found. City water has been found to be much warmer in summer than deep well water and is therefore more expensive to use in the making of artificial ice.

The refrigeration for the new plant will be furnished from the old plant of the Olympic Ice Cream Company, which is located across 25th street from the new plant.

We are what we have learned to be

EACH year we feel a higher sense of responsibility to the Ice Cream Manufacturers who depend upon us for advertising service. Each year we bring this work to a higher degree of perfection.

Our job is constant study of sales problems to the point where we can relieve the Ice Cream Manufacturer of all details of his advertising and supply him each year with a complete campaign, worked out to fit his individual needs, and of course, superior to any effort his competitor might attempt. Our 1922 Campaign is nearing completion. It is built upon a comprehensive knowledge of unusual conditions the country over during 1921, and is backed up by twelve years practice in successful Ice Cream Advertising.

To manufacturers who are located in territories where we do not at present have a client we are ready to submit plans. Use the coupon.

How Truck Tires Are Ruined

Tire Company Official Illustrates the Meaning of the Destructive Traction Wave.

"Solid tires wear rapidly when under heavy load," says J. V. Mowe, general sales manager of the Kelly-Springfield Tire Co. "The reason for this is simple, but is not generally understood," Mr. Mowe continues. "When anything is compressed it occupies a smaller space than it did before. Thus, when a pneumatic tire is pumped up it takes a large amount of the surrounding air and squeezes it into the restricted space of the tube. That air is compressed because the same amount of it occupies less space than it did before. But rubber is not compressible. You can change its shape because of its elasticity, but not the amount of space that a given mass occupies. Therefore, we say that it is not compressible, but that it is replaceable. Take an ordinary pencil with a soft eraser and squeeze it down on the desk. The eraser "squashs" out and bulges all around. It is shorter but it is also correspondingly wider. You have not compressed it by the pressure on the pencil, for you have not changed the total mass or volume—you have merely changed its shape by displacing part of it into the bulge. The softer and more elastic the eraser, the greater will be the amount of this bulge under given pressure.

"This displacement of the rubber is precisely what occurs in a solid tire. If the tire is sufficiently soft and elastic to produce resiliency, it will be considerably flattened at its point of contact with the road. The rubber which is pressed out by this flattening must go some place, and it squeezes out in the form of a bulge at the beginning of the point of contact with the road. Now as the wheel revolves, carrying its load, this bulge stays in the same place with relation to the road, but continually changes its position on the rubber of the tire. Thus when the wheel is rolling this bulge forms what is known as a "traction wave," which is the principal cause of wear in a solid tire. The more resilient the rubber of which the tire is composed, the greater will be the traction wave with all of the increased stretching and pulling off the rubber which accompanies it.

"The traction wave is formed, in a solid tire, because the rubber has no space into which it can flow when it is displaced by pressure. If we cut notches in the tire, however, the rubber will bulge and the wave will travl only until a notch is reached into which the rubber can flow. These notches form one of the patented principles of the Kelly-Springfield Caterpillar tire and provide a displacement space into which the rubber of each section may be forced. The action of these displacement notches is two-fold. When a truck is backed into the curb or other sharp obstruction, the surface of the tire is pressed in at one point and is stretched. Instead of extending this stretch throughout the large surface of the tire it is taken up by the notches which grow wider at the outside ends as the surface of the tire is elongated.

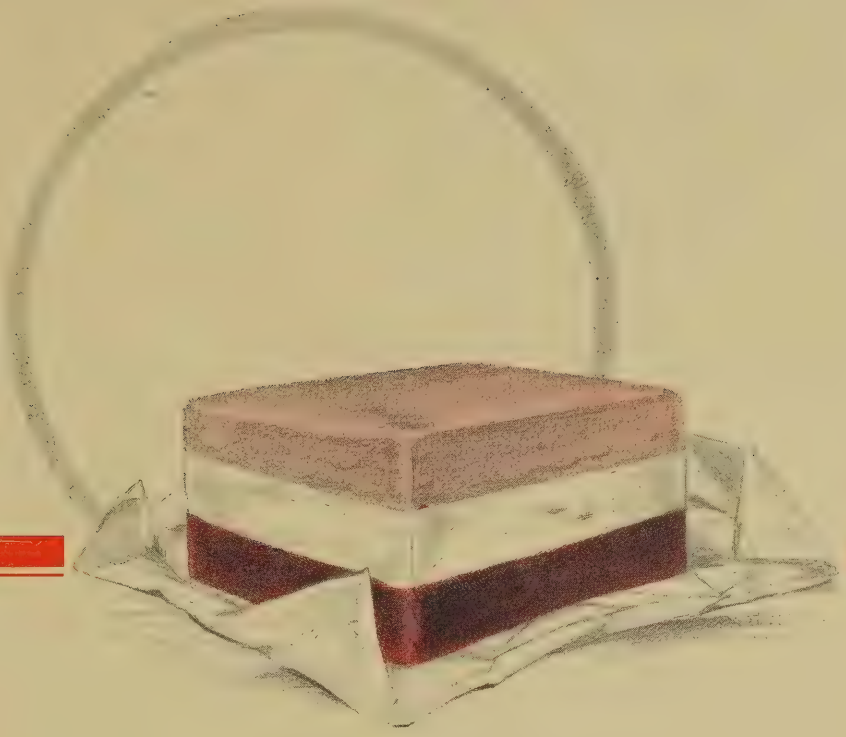
"On the other hand, a caterpillar tire subjected to load on a flat surface, especially at the moment of application of the engine power, will force the section of rubber in contact with the road out on each side because the resilient rubber has been flattened. But if this rubber has been flattened, it must also occupy a longer space because the mass or volume is the same. This added length of the section of rubber under load is absorbed by the displacement notches cut into the tire which, under such a condition, tend to close slightly as the tire revolves. As a succeeding section comes under load, the same action takes place, the elongation being absorbed by each of the displacement notches in turn. Thus the destructive traction wave is localized with the result that tires are longer-wearing and more resilient.

"The displacement notches in the caterpillar tire also furnish a firm traction grip to driving or steering wheels when running through mud, sand or snow. The resilient rubber allows the portion of the tire under load to become flattened, but the displacement notch, as it turns into contact with the road, presents a sharp, firm edge to the road material. Each section of the tire becomes a soft, padded foot of large area which enables the catrpillar-equipped truck to negotiate road difficulties insurmountable to other types of tires.

"This same notch construction also serves effectively to prevent wheel spinning and side skidding on wide asphalt streets and makes the use of chains unnecessary."

LITTLE ADVERTISING HINTS FOR THE ICE CREAM DEALER.

Ice cream, and the ice cream family, is a social food. People consume a certain amount of it as individuals, but it is enjoyed the most when eaten in crowds. And herein lies the confectioners' opportunity.



Family reunions, birthday parties, and particularly picnics, offer a chance for sales on an extensive and profitable scale. The point of this article is to suggest how to know when picnics are coming off and how to get the picknickers to think of your shop after they have been made to think of ice cream or other suitable confections.

A typewriter, letterheads and a constant perusal of the local papers make a good combination for bringing this about. If there is going to be a family reunion, where a hundred Joneses, more or less, will gather to do honor to Grandfather and Grandmother Jones, the papers usually tell about the event several days in advance. How easy for the confectioner, on the strength of this newspaper tip, to write a dignified note to the manager of the re-union, with a mixture of congratulation and suggestion that he can furnish the ice cream.

I live in a live Oregon town of ten thousand people, and no picknickers ever get such notes from confectioners. I don't believe it would be considered in this aggressive age as being in any way improper. Insurance men in the community know when a new car is bought and the purchaser will soon get a note or telephone call from one of them. Printers know the birthdays of the children of their community, and do not hesitate to suggest to the mother suitable printing for these recurring and profitable occasions. Stationers will send congratulations and suggestions for wedding stationery to couples whose engagements have been announced.

The daily or weekly newspaper in the town is a valuable trade paper to the confectioner if he cares to join the other merchants in considering it so and using it as such. He must keep his ear attuned to the happenings where his trade is converned. He must get the idea that it pays for Mahomet to go to the mountain occasionally, rather than to expect the mountain always to come to Mahomet.

Motor cars have multiplied picnics a thousandfold. A man in the confectionery trade can address typewritten notes with much profit to his business and to the catching of the patronage. Side by side, with this promotion, he can develop his cartons so that transportation of his goods in a cool, attractive and unmelted state will be a matter of convenience, and add to the cumulative upbuilding of patronage.—By Alfred Powers, Western Confectioner.

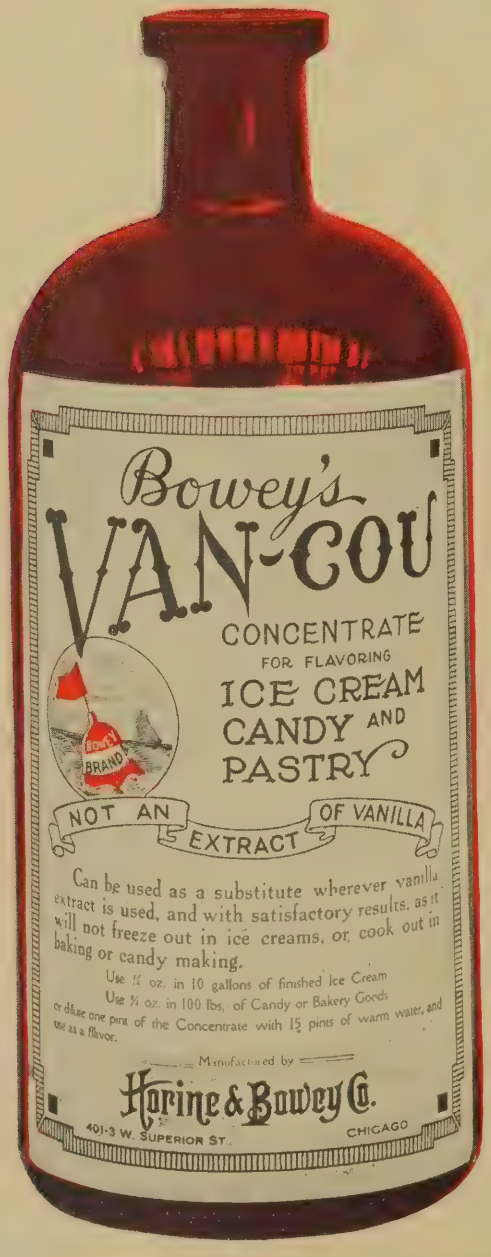
"Sentiment In Business"

IT has been said, "There is no sentiment in business." "That business is business" with no room for expressions of genuine appreciation for favors extended or special services rendered. However, we are happy to state, our experience has been otherwise. It has taught us that there is a sentiment in business which does play its part, and rightly so, in these busy work-a-days. It counts for much. We value it highly. And in the spirit of this friendly business relationship we extend to all ice cream manufacturers a most cordial invitation to meet us at our Dairy Show Exhibit, Booth Number 317, Mezzanine Floor.

Surely, the Dairy Show affords a most pleasant opportunity for all of us to become better acquainted and, thru this better understanding of each other, to conduct future business with a keener regard for the faith in one another's sincerity of purpose. Such is the nature of the welcome we wish most to greet you with at the Dairy Show.

The Boerner-Fry Company, Iowa City, Iowa

MANUFACTURERS OF HIGH GRADE EXTRACTS



We'll Dare You to Taste Your Flavored with BOWEY'S VAN-

You're an Ice Cream Manufacturer.

But before that—you're a human being. You eat, sleep, laugh and cry, just like the rest of us.

And the only way *you* can really judge an Ice Cream Flavor is by the way it *tastes* to *you*—just *you*.

And if the flavor doesn't freeze out, you know it, mighty soon, when you taste it.

But Who is the Ultimate Judge?

The Ice Cream eating public is the best judge of flavor. It soon finds the store that serves Ice Cream with that delicious *fresh smack*.

That is why Bowey's *Van-Cou Concentrate* will increase your business—it gives that delicious *fresh smack* to your Ice Cream.

"Retains its Flavor"

Besides this *distinctive flavor* it has a lasting quality none other has—it retains its flavor and *will not freeze out.*

HOW PACKED and COST: Bowey's *Van-Cou Concentrate* is put up in pint bottles (12 to case) at $4.00 the pint; gallon bottles (6 to case) at $30.00 the gallon.

CHAS. A. PARKER JOINS FREDERICK C. MATHEWS COMPANY.

Charles A. Parker, one of the ablest advertising executives in the country, has subordinated all other interests to become actively associated with the Frederick C. Mathews Company, Detroit, specializing in advertising and educational material for the dairy industry exclusively.

CHARLES A. PARKER

Parker will consult with leading members of the dairy profession in the interests of the industry, and serve with the advisory and editorial staff of the Detroit office.

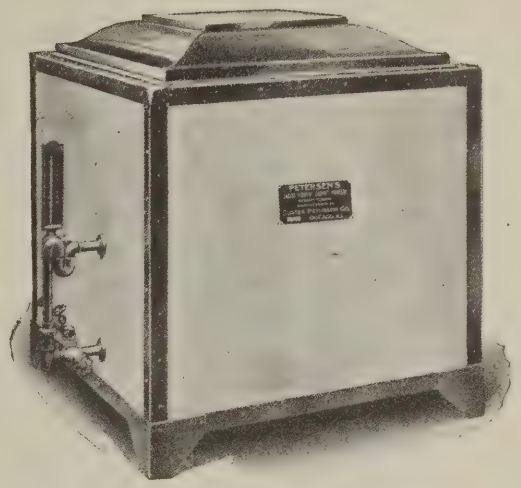
Frederick C. Mathews, as advisor-in-chief to the dairy industry, occupies a unique position and is receiving a recognition which justifies him surrounding himself with men of mature and seasoned merchandising ability.

This is in line with plans for further expansion of the business of the Frederick C. Mathews Company.

Mr. Parker returns to Detroit after an absence of several years in California. Prior to his departure he was for many years a stockholder and director of the Curtis Company, and originated and serviced some of their largest accounts.

He is to take an active part in the Mathews Company's affairs.

Mr. Mathews, in speaking of the connection, said, "Our business has grown so rapidly that it has at times been quite a problem to select seasoned and experienced men to keep pace with developments in the industry. Mr. Parker's long experience and practical application of merchandising should prove invaluable to our clients."



ICE CREAM PLANT OPENS AT WATERTOWN, WISCONSIN.

The ice cream plant recently installed by William Hartig in a portion of the brewery buildings in Cady street, Watertown, Wis., has been put in operation. The plant is located in the north wing of the brewery, the interior of which has undergone remodelling, with a view to perfect sanitary conditions. New cement floors were laid and the whole interior put in a spotless white condition.

The placing of the necessary machinery has been going on for several weeks, under the direction of James Lloyd, erecting engineer for the Creamery Package Company, of Chicago. The plant has been constructed with a view to increased capacity. Its present capacity is 500 gallons daily with a ten ton ice machine. There are two 300-gallon sanitary vats in which the cream is pasteurized and mixed. The hardening room has a capacity of 1200 gallons.

Mr. George M. Brown, a man of much experience in the manufacture of ice cream has been engaged to superintend the plant, which will also give employment to several men and be a welcome adjunct to the industrial growth of the city. Mr. Brown was formerly with Spate-Barrett Ice Cream Co., of Rockford, Ill.

Minnesota's Development as a Dairy State

By Northwestern Dairy Development Committee

MINNESOTA'S wonderful record in butter production, in which it leads the nation, and how the dairy cow, a real business stabilizer, came to the rescue of the farmer and the banker in days of stress will be one of the big object lessons at the National Dairy Show, which for the first time is to be held in the Northwest, October 8th to 15th, in the mammoth building on the Minnesota Fair Grounds where farmers, breeders, creamery men and others interested in the dairy industry will witness the greatest exposition of its kind ever held.

The coming of the National Dairy Show to Minnesota is a recognition of the commanding position the state has taken as a producer of dairy products. Minnesota boasts of its iron mines, forests, corn, wheat and potato crops but not many people realize that the dairy cow in Minnesota is producing wealth each year next only to its mines. According to figures compiled for 1919, the value of Minnesota's dairy products was $169,761,127, as compared to $200,000,000 for the iron mines. The corn crop that year was valued at $139,200,000, wheat at $90,788,000 and the potatoes at $41,264,000. Corn, wheat and potatoes are the three great staple crops of the state, but dairy production outstripped them all and the wealth producing possibilities of the dairy cow are just being realized.

It was not many years ago that Minnesota was one of the leading spring wheat states, but it was eventually found that continuous wheat cropping left in its wake a depleted soil and noxious weeds. It soon became apparent that diversified farming with livestock was the only way in which to restore and maintain the fertility of the land.

During the past year of financial depression the farming industry suffered from deflation. The state produced a tremendous crop in 1920, but it sold below the cost of production to farmers and left thousands of them unable to liquidate their obligations. When the business of the farmer is bad, all business is bad, because farming is the great basic industry of the country. But Minnesota has been more fortunate than many of her neighboring states.

An examination of the production by counties of creamery butter gives the answer. Farmers of Minnesota, patronizing 811 creameries, were paid the sum of $80,793,278 for milk that was manufactured into butter. This was for butter alone. Figures compiled by the State Dairy and Food Department show the total value of all milk sold to creameries, condensaries, city distributors, ice cream and cheese factories and all dairy products consumed on farms worth the stupendous sum of $169,761,127.

Minnesota has 27 counties that produced more than a million dollars worth of butter in 1919. Seven counties produced more than two million dollars worth and one county has a record of more than three million dollars. In Stearns, Meeker, Wright, McLeod and Carver counties the farmers were paid a total of more than $12,000,000 for their milk. Bankers or business men of these counties declare the business situation is good. Then in any of the counties in the western or southwestern part of the state that produced less than $500,000 worth of butter a different situation is revealed. The difference lies in the fact that the man who milks cows has a steady monthly income the year around. He isn't like the chap who gambles with the weather and the market on one or two crops only, and then has to dump his entire year's production on the market at one time. Few banks in Minnesota have been in serious difficulty, thanks to the dairy cow.

The surface of the possibilities of the dairy business has not been scratched, and yet Minnesota leads in butter production with 143,176,204 pounds in 1919. The state produced one-seventh of all the creamery butter made in the United States in that year, when Iowa produced 87,914,633 pounds and Wisconsin 85,054,334 pounds.

The reason the National Dairy Show has come to Minnesota is because of the great development along dairy lines. The show is an educational institution that has for its primary object the improvement of dairy cattle and the teaching of better dairy practice. The choicest dairy stock in the country will be assembled at St. Paul the week of October 8th to 15th, as object lessons in animal perfection. The most modern equipment now used in the farm dairy, the creamery, the cheese factory, the distributing plant, the ice cream factory will be shown. People from all over the United States and foreign countries will be present to see and learn. The dairy show furnishes the greatest opportunity farmers of the Northwest have ever had to study their business from a national standpoint, and it also permits business men and city dwellers generally to gain an idea of the importance and scope of this gigantic industry.

"Tell your friends and neighbors you are going to the World's Greatest Dairy Show, Minnesota State Fair Grounds, October 8-15, 1921."

JUST A NOTE FROM ONE OF THE DIRECTORS.

My Dear Fellow-Members:

I wonder whether each and every one of you realize the value the annual conventions of the association are to your own progress and to the progress of the industry.

I have never seen the Rotary slogan of "He Profits Most Who Serves Best" exemplified in a greater degree than in the ice cream industry. The very successful fellows have been the ones who have attended the conventions regularly, who have always been willing to give and who as a reward of their unselfishness have usually received the greatest benefit themselves.

Therefore, Mr. Fellow-Member, make this trip to the national convention a duty that you owe to your business and to your own progress. Do not mistake what I say. It is absolutely vital and necessary to your progress and I mean it exactly as I say it. Your business needs your attendance at the convention more than any one single thing, and at the same time you can make it your vacation.

WM. F. LUICK.

Industrial Relationship

Address by W. W. MARPLE, Director, Department of Industrial Relations, Beatrice Creamery Company, Chicago, Ill.
Delivered at the Meeting of the Michigan Association of Creamery Owners and Managers,
May 19, 1921, at Kalamazoo, Michigan.

HAVING been denied the opportunity of meeting with your association for a long time I deem it a special privilege to be here today, and my ambition is to make some suggestion that might be of some interest and benefit to you as individuals and to the cause you represent in general. When your secretary asked me to address you on this occasion I felt like the boy in a public institution in New York (that was attended by many races) when he was asked who discovered America. The boy hesitated to make any reply much to the teacher's surprise, and said, "Please, ma'am, ask me something else." She said, "Why should I do that?" He said, "The fellers were talking about that yesterday and Pat McGee said it was discovered by an Irish saint. Olaf said it was a sailor from Norway, and Giovanni said it was Columbus, and if you had seen what happened you wouldn't ask a little fellow like me."

The gravity of the situation in our business makes this meeting a serious one and requires the best brains, the coolest judgment, the greatest wisdom, and the richest experience to guide us in our deliberations, and I feel in a superlative degree my weakness. There is, however, one thing of which I am certain, and that is, In union there is strength, and in a multitude of counsel there is wisdom. Had I the wisdom of Solomon and the eloquence of Patrick Henry I know of no better subject than the one given me (Industrial Relations) to solve the great problem that confronts us, and I would burn into your memory those things that make us weak, and make plain to you the panacea that would scatter the clouds of impending disaster and place us on that pinacle of success so much to be desired, and the object of our continual effort. If we have been switched off of the track, if we are on the wrong road, if we are on the highway of extravagance, inefficiency, distrust, enmity, discord, envy, and strife that leads to chaos, I would point to the industrial pathway of economy, efficiency, confidence, friendship, harmony, charity, and union that leads to ultimate prosperity, success and happiness. The combined wisdom of all the ages has utterly failed to make a law that, if kept, would solve every question, industrial and social, such as was given us by the Son of Man centuries ago: "Whatsoever ye would that men should do to you, do ye even so to them." So appropriately and beautifully called the Golden Rule. I would if possible remove any doubt in your mind that this rule can apply in our business. It is the only safe and sane rule to be governed by in any business. It is the one infallible guide to success in man's relationship to man, and the only foundation that will withstand the storms of time. I knew a man whose rule of life was the golden rule, and in the conduct of the creamery business he reached the pinnacle of industrial supremacy by making it an inviolable rule. Abraham Lincoln, the greatest man in American history, who was placed in the highest position in the gift of the people, made the golden rule the ruling principle in his administration, and the victory he achieved has no parallel in the annals of time, for he conquered prejudice and changed enemies into friends, hatred into love, and left an impress on the hearts of men that time nor eternity cannot efface. Dr. Shannon said that a man once said to him that Lincoln was an ugly and a vulgar man. He replied that God spent so much time making the soul of Lincoln he had none left to give to his personal appearance in making tht habitation for that soul. History is replete with the story of men who attained the greatest achievements through the application of the golden rule, and there is not a single instance on record of a failure where it was applied. Why not incorporate it into the rule that governs us in our industrial relations.

A very illiterate man was elected to the Missouri legislature on the promise that he would have a law passed that would protect the sheep from the onslaught by vicious dogs that seemed to prevail in his district. He went to a lawyer to have a bill drawn and when the man asked him what he wanted incorporated in this bill he said, "Make it so it will suit my constituents and not interfere with the dog." The Golden Rule will suit our constituents and certainly not interfere with our business.

Robert K. Fask says: "Industrial relations management has developed through a process of evolution in the relations between workers and management."

One of the most constructive leaders in the study of industrial relations and the originator of one of the most practical and successful systems of industrial relations management says: "The industrial system now passing contained a world of struggle, of selfish greed, of competition, of the domination of the strong and the crushing of the weak, or irresponsible management, and of a belief in the materialistic concept of life."

The same thing is true with us collectively as with any individual organization. I see no difference in our business and a steel mill or a woolen mill or a printing office except that we are larger than any individual organization. Every man who milks and furnishes us with the raw material is a part of our organization and our relation to those people is identical with the relation of the management of a woolen mill or cotton mill to the employes of that mill, and if we prosper they must prosper. No set of men can do efficient work unless they are happy. Modern management realizes that; so in the pursuit of our business we want to remember that our industrial relation field is broad. It reaches away beyond those with whom we associate daily in our factory. There is not only the producer but the consumer as well. During the war when prices for butter fat as well as all farm products were high, general conditions were conducive to happiness for the farmers' reward was abundant. They didn't need any coaching, we may have neglected them. Now their wages are reduced materially by a reduction in the price and they need especial attention because they are unhappy. It requires the greatest care to keep them from rsigning, and when they do we are out of business. During the war help was scarce. There were two or three jobs for every man. Efficiency was at a low ebb. Men were indifferent and careless. If he didn't like one job he could get another. Men who had been getting fifteen to eighteen dollars a week were offered six to eight dollars a day. Money was the most plentiful thing on the market. People went wild, the most extravagant habits were formed. Cotton shirts remained on the shelf covered with dust, and the demand for silk shirts at any price was far in excess of the supply. Cotton hose factories closed down and silk hose factories ran day and night to meet the demand. Women wore seal skins and diamonds, and men hundred dollar suits and overcoats, and everybody owned an automobile of some kind. The marriage license departments required extra help. High priced flats were elegantly furnished, and every meal was a banquet. Theaters and operas at unheard of prices hung up the S. R. O. sign every night. Railroad trains and electric cars were crowded to capacity. The lower and upper berths in sleepers were occupied every night. The greatest extravagances were indulged in everywhere. We were like the old colored man who lived close to Mr. Sloan down in Georgia and was often hired by him to do odd jobs around the place. There had been a storm and many of the fences were blown down,

MANUFACTURERS OF WEST VIRGINIA.

Your Secretary, C. J. Jamison, in a recent letter, says in part:

"I hope and urge that every manufacturer in the state of West Virginia shall take the time to attend the annual convention of the National Association of Ice Cream Manufacturers, which will be held at Minneapolis, Minn., on October 10th, 11th and 12th. This promises to be the most important and instructive ice cream manufacturers' meeting ever held."

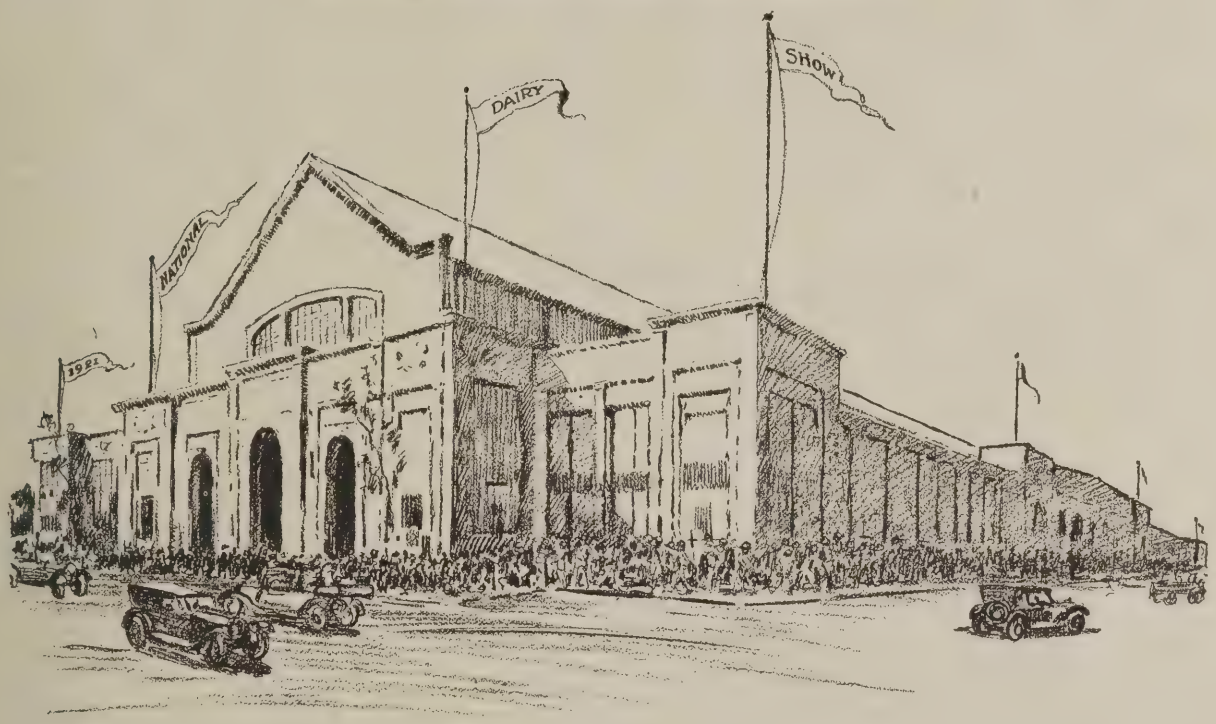
and Mr. Sloan saw the old man and said, "Uncle Mose, I would like to have you come over Tuesday and help fix up the fences, and by the way, we expect to butcher on that day and you can have the jowls." The old colored man replied, "That's all right, boss, I'll come over and help fix up the fences, but since I got my pension I been eatin' a little farther back on the hog."

Note the change that was inevitable. The pendulum had to swing back and as it had swung too far one way it had to swing proportionately far the other way. Those who dance must pay the fiddler. The dance is over and the fiddler has presented his bill. Help is plentiful. There are two or three men for every job. The highest degree of efficiency is required. Men who were indifferent and careless ar now on the alert and careful. If he doesn't like his job he hangs on to it anyhow for he doesn't know where to get another. Some men who were getting six to eight dollars a day have gone back to eighteen dollars a week. There are lots of things more plentiful than money. Economy is the watchword. Cotton shirts look more attractive and are more fashionable. Silk hose are being made out of cotton, and the pure article has been darned. Pawn shops are loaded down with seal skin coats and diamonds, and men are wearing overalls instead of hundred dollar suits. Garages have become second hand automobile sales depots, and the streets are lined with machines that have the "For Sale" sign on them. Extra clerks in the marriage license departments have been discharged and divorce courts are crowded to the limit. People are living in tents and buying modest furniture, a dollar down and a dollar a week. Pork and beans have taken the place of chicken, goose, livers, and caviar, and free soup kitchens haven't soup enough to go around. Strong healthy men strike you in every block for a little money to get something to eat or a place to sleep. Butterfat has dropped from 75 to 25 cents and yet it is acknowledged by dairymen to be the most substantial and dependable of any farm product. Notwithstanding this conclusion there is much dissatisfaction. There is a firm conviction that the price of dairy products is unfair as compared with other commodities, and this may be true. So may it be true that in some instances the compensation for labor is not in harmony with house rent, and children's shoes, but all this is regulated by the immutable law of supply and demand. During one of the panics of the last decade Tom Watson of Georgia, a lifelong Democrat and an orator of national repute, got disgusted with the Democratic administration and was running for office on the Populist ticket. In his appeal for votes he blamed the condition of the times on the administration, and in referring to the rich promises made by those in office he said in one of his speeches: "Two years ago we were living on the ambrosia of Democratic expectancy. Today we are living on the corn cob of Democratic reality." My friends, we have had the ambrosia. The man in your institution who is in trouble is not himself and cannot render the best service. In many instances his trouble is imaginary. He needs counsel, he needs encouragement, he needs treatment. I know a man who thought he was dying from heart trouble. He got out of bed and stuck his head out of the window and gasped for breath. A physician in whom he had confidence was called and he told him to lie down and be still. He examined him and said: "There is nothing the matter with you, there is nothing wrong with your heart, you ought to get up and go to work." The man was at work the next day. That was fourteen years ago, he is still doing business. It has been necessary for him to go to this doctor occasionally to have him tell him there is nothing the matter with him, and with this treatment he has grown to be as great a specimen of health as can be found. This is not exactly the situation with the dairyman. With him, in the language of Grover Cleveland, "It is not a theory but a condition." Many dairymen are producing butterfat at a loss. He is gloomy, he is discouraged, he says there is no use. He is brooding over the situation. He is in no condition to meet the situation bravely and work out a plan to improve conditions. He needs some kind of a shock to eliminate that depression that is hastening him on to failure. I have in mind an instance that I believe is worth relating and may be of some assistance to all of us, for the creamery man is now passing through an experience that to say the least is not conducive to happiness but creates worry to such an extent that we are unfitted for business, because the energy that should be applied to changing conditions is consumed in worrying. The incident to which I refer is the experience of a banker. In starting his private bank he secretly felt that he did not have quite enough capital, but he started and for a time met with remarkable success. Later there was a tightness in the money market, some of his best customers came to have their notes renewed. He couldn't afford to lose them, so he renewed their notes. All the time he harbored the feeling that he hadn't capital enough, he began to worry, he tried to keep outsiders and his depositors from knowing that he was hard pressed. His worry changed his manner, he became less pleasant to meet, he became morose and crusty, first at home, then with his employes. Customers noted the change and some of his small borrowers who pay promptly and that he needs the worst go somewhere else to borrow money. Depositors feeling the morbid atmosphere got uneasy and drew out their deposits. He expected his bank to fail and his own savings and his honor to go down with the bank. He expected the bank examiner in a few days, his name is Gregg. He feared him. About this time his wife prevailed on him to visit a psychologist. He hesitated because of the fee. The psychologist, a woman, realized his mental attitude must be changed and that very quickly. After a long talk he promised to carry out her instructions. She discovered he had twenty dollars and she charged him that amount. That was the first shock. She wanted him to feel he had purchased a right to expect results. She went into another room and wrote on a slip of paper:



"Little Jack Horner
Sat in a corner,
Eating a Christmas pie,
He stuck in his thumb,
Pulled out a plum,
And said, "What a big boy am I'."

She placed this in a sealed envelope and told him to open the envelope at nine o'clock and read the lesson three times. The next morning at eight he was to read that lesson three times and do his best to realize she was trying to help him get his mind off his worries. Then at twelve no matter where he was he was to read them over three times, and repeat exactly at the stroke of three. A short time after opening the envelope at night his wife called up the psychologist and told her she was afraid the man had lost his mind, that while he was not in the habit of swearing the air was blue. She told the wife she would expect him to live up to his word. He didn't sleep any but occupied the time thinking about the swindle out of twenty dollars and how he would get even with the woman. He went to the bank and was mad. His associates noticed the change and it was a relief. He stuck to his promise and read the lesson over as instructed. Finally his anger cooled off. He remembered the woman had said, "It will take a shock to jolt you out of your fearful lethargy and get your mind off your worries," he said, "I got the shock all right and I forgot all about my troubles last night." He saw the point of what she was trying to do and he smiled. Then he read it over again and laughed out loud. The cashier went into the office where the banker was, to see what had happened and when the banker told him about it they both laughed. He gave up the thought of having the psychologist arrested. Mr. Gregg, the examiner, came, went into the office, learned the whole story and told the banker his bank was all right, all he needed was more capital and he found it for him. To me this is a wonderful lesson. During the time when this banker was worrying himself sick and incapacitating himself for business he needed what the girl told her sweetheart he needed. They were walking on the beach near St. Augustine, Florida, and the wind was blowing a perfect gale. The young man had tried for some time to get up courage enouh to propose, and his girl had hoped he would succeed. On this occasion everything seemed to be favorable, the music of the sea waves was inspiring, the solitude in the absence of a human being to be seen anywhere was conducive to that confidence that leads to a permanent union, conditions were perfect for the long expected proposal. The young lady was sure it would come, only to be disappointed. Finally the young man began to spit and make a good deal of fuss and his girl asked him what was the matter. He said he had gotten sand in his mouth, and she immediately said, "Swallow it, kid, you need it in your gizzard."

Now keep in mind there is an industrial relation between you and the producer. When you get your balance sheet at the end of the month and find a loss you immediately hunt for the cause. You cannot eliminate the trouble by raising the price of butter or lowering the price of butterfat below the market for you have nothing to do with the market. As a rule you can find some slack motion somewhere, some waste, maybe some trouble in quality. A reduction of expense by greater efficiency through harder work or improved machinery, and elimination of waste, and improvement in quality, and increase in volume. The dairyman is in exactly the same situation. He cannot control the market, but he can control very largely the cost of production. He may need some new machines, or better care and better feeding of what he has. Don't forget he is your partner. Tell each other your troubles and solve the problem together. In your manufacturing plant your relation is with the office force, the manufacturing department, the print and packing room, the sales force, and

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

the shipping department; but this is not all, it is only the beginning. There is the producer and the consumer and they are legion, and I beg of you don't let the almighty dollar hide them from view.

From an industrial standpoint our relationship is close for upon these we must depend for the perpetuity of our business. I am impressed that the greatest incentive to act in any movement is selfishness. The greatest awakening in the advancement of any cause comes through an appeal to selfish personal interest. I care not who it is or what the cause I am glad to acknowledge that while the accumulation of wealth is the most alluring it is not the only inducement or motive that prompts us in our efforts. The elevation of our social position, the acquiring of superior knowledge, the attainment of high political position, the matter of a profession, the greatest proficiency in the world of sports, popularity, fame, and it may be the joy that comes with the consciousness of having done a good deed are all to be considered. There are just two principles by which we are governed in all our actions. One is the fear of punishment, the other is the hope of reward. So in my effort today to awaken a deeper interest and encourage a closer industrial relationship I am particularly favored by being able to warn you of the danger of punishment and at the same time impress you with not only the hope but the certainty of reward.

A few days ago I sat in an amphitheater in the midst of four thousand people and I heard this question asked in poetry and song:

"Somebody did a golden deed
Proving himself a friend in need,
Somebody sang a cheerful song
Brightening the skies the whole day long,
Was that somebody you?

Somebody said 'twas sweet to live,
Willingly said I am glad to give,
Somebody fought a valiant fight,
Bravely he lived to shield the right,
Was that somebody you?

The problems that confront us will not work themselves, and upon your effort and mine will depend the outcome. If united we make a valiant fight and bravely live to shield the right, if success (that is sure) crowns our efforts, if we have proven ourselves friends in need, then will we welcome the question, "Was that somebody you?" If we live thoughtlessly in vain, if we fail to embrace the opportunity, then through the ages to come will be heard the voice of the producer and the consumer crying in their distress, "Was that somebody you?" Now is the time to make hay while the sun shines. Walter Malone says in a beautiful poem on opportunity,

"They do me wrong who say I come no more
When once I knock and fail to find you in,
For every day I stand outside your door,
And bid you wake, and rise, and fight, and win,
Each night I burn the records of the day,
At sunrise every soul is born again."

This is a comforting thought for if we believed that opportunity knocked but once many would be compelled to live in despair, for few there are who cannot look back at a lost opportunity. The unsuccessful man is he who is deaf to the knock of opportunity, and satisfies himself that it will come again. The same is true of a business enterprise or an organization. The man who shuffles along through life anchored to hope, inspired by the fallacy that there is just as good fish in the sea as ever was caught, is a failure. It makes no difference how often opportunity knocks this man is the same shuffling failure. He is like the Justice of the Peace said about his wife. In a little village not far from my Missouri home Giles Cook ran for justice of the peace and was elected. He was very much elated and went strutting home to tell his wife. She said, "Now, Giles, if you're Justice of the Peace, what am I?" He replied, "You are a damn fool like you always were."

There are two things in connection with opportunity as it pertains to a successful life. First to be able to recognize the knock and then to respond with promptness and intelligence. The man who is awakened by an alarm clock and turns over and goes to sleep several times in succession finally does not hear it, his sensibilities are dulled; so I believe it is possible to become deaf to opportunity's knock and blind to the possibilities. It was Daniel Webster who said "There is room at the top." With this as an axiom opportunities are multiplied in every profession and every industry. The names of men are legion who have sought and found opportunities. Peter Cooper learned that American glue was defective and that we were dependent on foreign products. He saw the opportunity and manufactured a glue that met the needs and made a success. James Gordon Bennett saw the need of a great daily paper in New York City to be conducted on certain principles, and he established the New York Herald and perfected it. Booker Washington, Cornelius Vanderbilt, and John D. Rockefeller, were all examples of seizing opportunities to their own gain and the benefit of humanity. P. D. Armour towards the close of the Civil War knew that pork would decline on the fall of Richmond and sold out, laying the foundation for the Armour millions. A barber saw that if he had an instrument that would cut men's hair a uniform length it would save him work, the result was the invention of the clippers. Adams, who organized the Adams Express Co., Stanford and Huntington, who built railroads on the Pacific coast, and George M. Pullman, who perfected a conveyance for the comfort of the traveling public, immortalized themselves and amassed fortunes by responding to the call of opportunity. I would not forget that the secret of success is to be ready for opportunity, and that the common events of life bring the rarest opportunities. Doctor Babcock discovered a means by which the fat value of milk and cream could be determined accurately and quickly. Doctor De Laval utilized a principle in mechanics through the invention of a machine that separated the solid from the fat in milk by centrifugal force. Doctor McCollum after years of research and experiment has discovered the true value of dairy products as a body builder and health promoter. The names of Lincoln and Grant will live forever as statesmen and warriors, and yet they might have lived lives of obscurity and filled the graves of a recluse had it not been for the opportunity given by the Civil War. Foch and Pershing are household words, no history will ever be complete without a story of their valor and generalship. Opportunity knocked at their doors and they opened them.

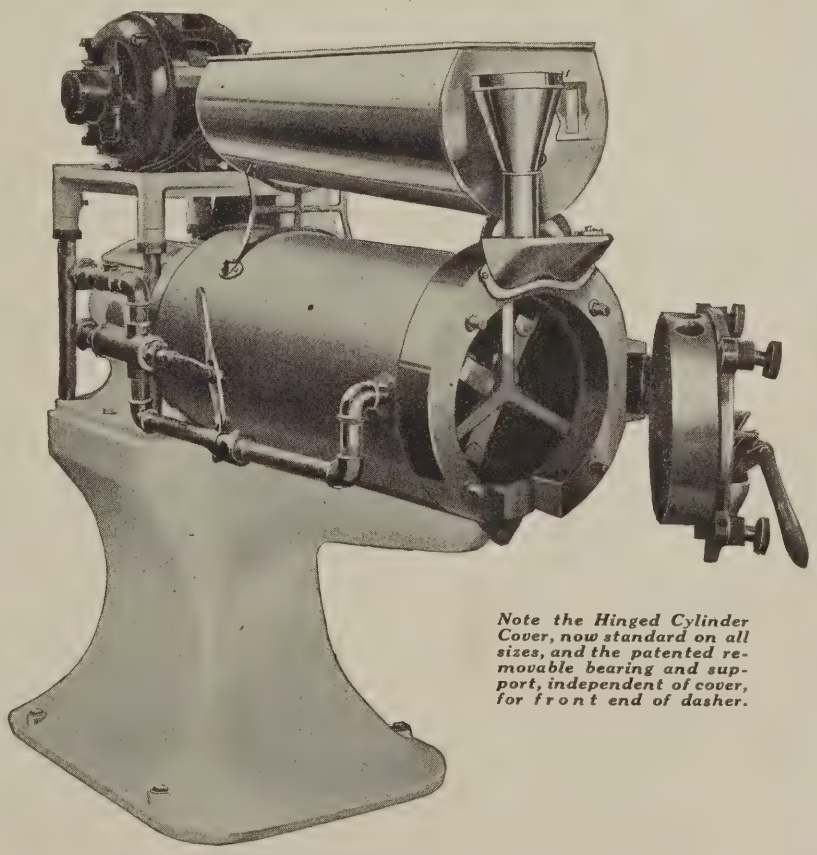
The unusual and abnormal conditions that have affected business in general and ours in particular has opened wide the door of opportunity for these organizations and for executive heads who have met at this time for conference. As Pilots you have assumed grave responsibilities, for on you depends the entering of the frailest bark under your command into the harbor of safety and success. Just remember that you are passing through a part of the stream that is full of shoals and an occasional breaker. The headwaters of this stream because of volcanic disturbances are at this time muddy and boisterous, and every time they begin to clear and quiet down some crater in Minnesota belches forth melted lava, stirs up the water, and covers our crafts with ashes. Opportunity is knocking at our doors now individually and as an organization, and as it stands outside awaiting recognition we must quickly decide or it will be gone. The producer says, you don't pay for butterfat in proportion to what you get for butter. The consumer says, the price you charge for butter is an outrage when you pay so little for butterfat. The creameryman when he looks at his statement at the end of the month says, we are paying too much for butterfat and selling butter too cheap. There is something wrong. You say the producer is never satisfied and the consumer is always kicking, and they say you want the earth. I am satisfied to an extent that they are all right and justified in making a complaint sufficient to cause a careful analysis, and if found necessary use a neutralizer. The remedy, in my opinion, is economy. The producer is dissatisfied because he isn't making any money. His relief can only come through economy and in most instances his only means of economizing is by greater efficiency and increased production. The man who gets $3.00 a day for chopping wood and only chops one cord makes the chopping of wood cost $3.00 a cord, and this $3.00 enters into the price. By increasing his speed to two cords a day he reduces cost to $1.50 a cord and this reduces the price of the wood. It is possible to cut three cords and this would reduce the cost to $1.00 a cord. In other words that leaves $1.00 for the man who chops the wood, $1.00 additional for the man selling the wood, and $1.00 reduction to the man buying the wood. The dairyman whose cow costs him 30 cents a day to keep and from which he gets one pound of butterfat that he sells for 25 cents is losing 5 cents a day. He finds by investigation that he can increase the production to 2 pounds a day with only 5 cents additional cost for feed, so that his expense is 35 cents and his income 50 cents, which makes him a profit of 15 cents a day instead of a loss of 5 cents. Possibly the limit of the cow's capacity is one pound, and he finds that he can procure cheaper feed for 20 cents a day that will produce the same result. He then has a profit of 5 cents a day instead of a loss, and the difference is 10 cents. If he has ten cows he has increased his profit a dollar a day. I mention this to emphasize how opportunity knocks when the occasion demands. Out of this condition investigation is encouraged and the result is a contribution of thousands, even millions to the dairymen of the country through more intelligent feeding. I am wondering how far our opportunity reaches in the direction of removing some of the

Why The U. S. Freezer Is A Heavy Duty Machine

YEARS of experience in the designing and manufacturing of ice cream freezers has shown the superiority of heavy duty construction throughout, with ample bearings and large gears made by the best process known of the best materials obtainable.

The shafts, bearings, gears and housings of the U. S. Heavy Duty Freezer are more solid and heavy than any ever offered before.

The gears used on all sizes are of the generated type exclusively.



Where common composition metal is ordinarily used for bearings, U. S. Heavy Duty Freezers have bronze or roller bearings.

On the larger sizes, the gears are made of case-hardened machined steel, instead of the usual cast iron.

Everything to promote saving in labor, time, space and power has been enbodied in these up-to-the-minute freezers. No other machines are so easy and convenient to handle, so reliable, so economical in power, so durable, so saving in space. On account of their simplicity of operation, they do not require such skilled, high-priced labor to operate them as old-fashioned freezers do. With the larger sizes the same labor may turn out considerably more ice cream with U. S. Freezers.

U. S. Heavy Duty Freezers lower the cost of manufacturing ice cream, and will help both the small and large manufacturers to meet all competition without lowering the quality of their ice cream.

They will be on exhibition at the National Dairy Show at Minneapolis. In the meantime, write for complete details and ask for our circular, "How to Tell a Good Freezer," which is yours for the asking.

Note the Hinged Cylinder Cover, now standard on all sizes, and the patented removable bearing and support, independent of cover, for front end of dasher.

rough places in the dairymen's pathway with whom we have a very close relationship.

It is said that necessity is the mother of invention. It is the key that unlocks the door to opportunity's knock. There has never been a time that such an opportunity was extended to this organization as right now. The cry for help comes from every quarter. Now is the time to make a record, to do some real constructive work. Business in our line is sick. I doubt not the patient has been examined by each one of you and the case diagnosed. The pulse is below normal, the temperature is high, the case is dangerous, and the object of this meeting is to hold consultation. In some cases, not represented here, it is too late. The patient is beyond hope. The disease got too far before a remedy was applied. I doubt not your unanimous conclusion will be that the application of economy in large doses will be the principal ingredient, and the necessity for immediate action or application is apparent. I remember an incident in my own life that explains the situation in the case over which this consultation is being held. I woke up one night suffering with the most intense pain. I immediately called our family physician. After a cursory examination he sent for another doctor. They retired to a room adjoining to discuss the case. My wife standing near the door could hear them and she understood the gravity of the situation when the following dialogue took place. One doctor suggested a remedy. The other one said, "That's dangerous, it might kill him." To which the first one replied, "He'll die anyhow unless relieved immediately." So I say, ours is a case that needs heroic treatment. It may not be wise or expedient to reduce factory wages. They may not be out of line now, but efficiency can and must be increased. The tester must test two samples where he tested one before. The butter maker must churn two pounds of butter where he churned one before. The print wrapper must wrap two prints where he wrapped one before, and so on down the line. Along with this, and most important, the buying cost must be reduced. The day of three and four and five cents a pound for buying cream is a thing of the past. It is gone forever, it is unfair to the creamery, to the producer, and to the consumer. A cent a pound in the mildest cases and three cents in the worst cases means thousands of dollars, which if equitably divided will save the creamery, add to the dairyman's revenue, and reduce the cost to the consumer. In addition to the commission for buying cream innumerable additional expenses have crept in that must be eliminated. All of this is in harmony with industrial relations. This disease called extravagance that was contracted during the war and that has been eating like a canker on the creamery industry is not only an epidemic but a contagion, and to eradicate it will require co-operation. When a contagion breaks out in a community the citizens are asked to co-operate. They respond cheerfully and by so doing they stamp it out. The members of this organization are very closely related. They are one family, have a common purpose with the same end in view, and I warn you if a remedy is decided on (and that is imperative) if anybody fails to apply it and the disease breaks out, remember it spreads like wild fire and the second attack is always worse than the first; and the hospitals will be inadequate for the patients. So I ask you in the name of all who are interested in this great industry, co-operate and let your rule of action be the Golden Rule.

Industrial relation should be synonymous with co-operation, not only within our own individual organization but with our competitors. It has been demonstrated that the man who whole heartedly works to give his associates the best co-operation gets the same brand in return. That is as true in our business as competitors as it is our separate organizations. Co-operation is a recognition of the rights of others. It is a direct appeal to the best that is in your competitor. Co-operation does not eliminate proper competition. Perfect co-operation wipes out resentment, jealousy, anger and malice. Co-operation is necessary to progress. The one who fails to co-operate works against himself. Co-operate with your enemy, it will help make a friend of him. You can't go it alone. It was co-operation and a recognition of the relation between the different armies in the late war that made victory possible. The success of any man, of any organization is sincerity. Practical experience has shown that one cause of failure is the lack of co-operation. That is just as true in the case of competitors as inside of a corporation. I have in mind a man who was in the creamery and produce business who felt strong enough to stand alone and refused to co-operate. When the receiver was appointed he found over seven hundred thousand dollars liabilities and about fifty thousand dollars assets. The man had the satisfaction of making it cost his competitors a lot of worry and unrest and probably a profit. He had his own way and a clear field. He was a big man for a time and for his price for the raw material was a reflection on his neighbor in the same line of business and who couldn't meet it; but finally he was in the situation of the stingy man who was scoring his hired man for his extravagance in carrying a lantern when he went to see his best girl. He said, "When I went courtin' I never carried a lantern. I went in the dark." "Yes," said the hired man, "but look what you got."

I beg your indulgence to enumerate some of the things to remember and some of those that are to be considered in industrial relations, for the field is broad to be covered. Sincerity is essential, optimism, cheerfulness, environment, happiness and reward are prominent elements in an industrial relationship. Time forbids elaborating on the influence of these as it pertains to efficiency and success. The foundation of our business is the raw material. This comes from the farm and is prepared by the household who depend on the revenue from this product for the necessities and comforts of home. The future dairyman is to be reckoned with, he is to be the successor to the present management. He is a prominent factor and needs encouragement in order that the business may be perpetuated. He is the absent one and our hope. He is the greatest discovery of the twentieth century, and my message in his behalf is not alone because of his prominence, but in addition for the sake of his mother, the sweetest word ever uttered by mortal tongue, the uncrowned queen of the American home, and to whom we owe as creamery men much of our prosperity. I would offer our sympathy for him who fails to appreciate the twentieth century boy. Let us gather flowers and strew them along the young man's pathway and light it with the light of experience, and send a message to his mother promising unqualified protection to the boy she loves, and careful consideration in the interest of his success. Philip Armour said a boy counts one long before he can vote, without him the wheels of commerce would stop and the hum of machinery in our industrial institutions would be forever stilled, for he goes into every avenue of social, commercial and industrial life, undaunted by danger and not deterred by the elements. We love him for his energy as well as his heroism and we will give him recognition by a careful consideration in the discussion of industrial relations problems.

Let us remember the twentieth century home of which there is no word in the English language so expressive and full of meaning. We may differ on politics and religion and the manner of conducting our business, but we will all agree on that place, around which clusters the most sacred memories, and in our activity and all of our deliberations we will never lose sight of a contribution to the betterment of the home. Much pleasure as it would give me at this time I will desist from a discussion of the modern home, for it is an extended as well as a beautiful story.

Gentlemen, by virtue of a common calling we are one family. A house divided against itself can never stand; so in conclusion I want to impress on you the necessity of co-operation and the reward that is assured as indicated by every contingency that has arisen in the history of the American people. We have gone through a season of unusual prosperity and in consequence the present depression is all the more keenly felt, because of the comparison, and the need of co-operation is the more apparent. The present low prices of butterfat and the attendant difficulty in adjusting our business ought to be a stimulus to greater action. Will Carlton says to enjoy heaven we have to be in hell awhile. So when the storm has passed and the business horizon has been cleared of the clouds and the sun shines we will feel all the better for having gone through the bitter experience of an industrial upheaval. I believe that the creamery man is not only the world's greatest philanthropist but the synonym of supremacy in the industrial world, and we are especially favored in having an opportunity to prove it. A lady was going to have a social function at her house and her niece asked her if she was going to ask her next door neighbor. She replied, "Well, I should say not. I entertained her once and she never recuperated." If in your business experience you have some competitor whom you entertained and he never recuperated, forget it. Clean the slate and begin anew, your mutual interests are in jeopardy. Your business has been assailed, its foundation is being undermined by that arch enemy—Extravagance. You need help. No general ever won a battle alone. In 1861 when the Union was threatened with dissolution a mighty army arose to protect it. Political enemies worked side by side to meet the enemy. All differences were forgotten and there was true co-operation without which the cause had been lost. We would today be under the cruel dominating rule of a king if the spirit of co-operation had not prevailed in the late war. All differences were forgotten. All social barriers were broken down. The millionaire and the hobo bunked together. All religious faiths were amalgamated, the Jew and the Gentile, the Catholic and the Protestant united in a common cause. Co-operation was complete, and victory was sure. Emerson

Not what *we* say, but what *others* say who make *HEATHMADE* Ice Cream

HAZELWOOD COMPANY, SPOKANE

"Hazelwood Carbonated Ice Cream is not only 100% purer, but far better than the best ice cream we ever made before Carbonation was discovered"

BOEDEKER MFG. CO., DALLAS

"There's as much difference between Carbonated and ordinary ice cream as there is between a carbonated ice cream soda and one made with plain water"

HYDROX COMPANY, CHICAGO

"The damage that air does to foods is too well known to need stating. It sours milk—spoils canned fruits and turns butter rancid. Why freeze it into ice cream? We DON'T. And therein lies one of the most important reasons for the rapidly increasing demand for our ice creams"

And there are scores of others from manufacturers who swear they wouldn't go back to the old fashioned air-whipped ice cream at any cost. Heathmade Carbonated Ice Cream is better, safer, cleaner and purer. It stands up better and sells faster than any other kind.

The first scientifically worked out advertising and merchandising plan ever offered ice cream manufacturers is an important part of our service. Ask us!

Heathmade Carbonated Products Co.

Sole Licensors of Heath Patents for Making Heathmade Carbonated Ice Cream

Wrigley Building **CHICAGO**

expressed a beautiful thought when he said: "In the beginning the Gods divided man into men that he might be more helpful to himself." We get out of life what we put into it. This is the law of compensation and is unchangeable. Selfishness breeds contempt and misery. Extravagance and wastefulness breeds poverty. Economy brings wealth. Cheerfulness assures contentment. Generosity and the discharge of duty creates happiness. Virtue has its reward. We get out of our business, and we will get out of this organization, what we put into it, honesty, courtesy, loyalty and service brngs success.

In my anxiety to fulfill a mission and in behalf of the interests you represent as well as the dairyman, the future dairyman and his mother and the home, I beg of you regard this question of industrial relations seriously. Remember the bigest part of any business is the human part of it, and where this is shorn of its beauty or divested of its ideality and sentiment the business itself is limited to that extent. Let your attitude towards your competitor be that of a brotherhood. Co-operae, the cry of co-operation resounds from coast to coast and from the Gulf to the Great Lakes, and the voice of a common brotherhood can be heard from across the mighty deep as it reiterates the watchword—co-operation. Go away from this meeting with the spirit of co-operation and enlist under the banner of economy, and the state of Michigan will resound with the battle cry of freedom.

EULOGIZING W. W. MARPLE.

Mr. R. F. Frary, secretary of the Michigan Creamerymens' Association, is some poet. We always knew he was an artist in handling the king's English, but we didn't know he was an aspirant for honors in the poetical field. Here is an expression by him in honor of W. W. Marple, of Chicago:

With hair as white as a silvery night
On a moonlit sheen of snow,
With an eye as keen for good or mean
As any man I know;
With a face as round and smooth and sound
And wrinkle-free and fair
As the maiden queen some seventeen,
With creamy waving hair.

With an ear that's trained to hear the strain
Of a struggling brother's call,
And a heart that moves and not reproves
With a fainting fellow's fall.
A mind that guides the hand that gives
Both mental and material gifts,
And best of all a soul that's full
Of sympathizing love.

Men love him most who know him best;
But all the creamery host
Will sing his praise in future days
From coast to shining coast.
So we honor our friend who measures men
Not by a code of heartless gain,
But by the little or much of human touch
Contained in the human brain

A FLOURISHING MISSOURI FACTORY.

The following account of a Newsboy's Picnic is gleaned from the Jefferson City Post, Jefferson City, Missouri:

"The newsboys' parade temporarily caused business to recess while merchant and clerk stepped to the door to see what it was all about. Pedestrians stopped in their tracks to smile and to wave at the happy youngsters. Armed with whistles and other noise-making devices, the boys, about sixty in number, left Weber's factory, marched down Madison street to McCarty, McCarty to Jefferson, Jefferson to High, High to the courthouse, where they boarded a street car for State Park.

Under Weber's arrangement a special street car was on the sidetrack and was given right-of-way to the park. There Weber had all the ice cream and cake hungry youngsters could dispose of. A wagon was held in readiness to get more should the supply fail to meet the demand.

The boys picniced until 4 o'clock, when they returned to their respective newspaper offices to carry their papers. "'Well," they were asked, "did you get enough?" "Uh huh," was the answer. They looked it.

The picnic was given to commemorate the eighth anniversary of the Weber Ice Cream Company. The boys unanimously agree that Weber knows his eggs when it comes to celebrating a birthday.

Eight years ago, July 21st, 1913, Weber Brothers bought out and took possession of the little one-freezer ice cream factory of W. C. Callender & Co., 309 Madison street, Dallmeyer building. Their output at that time was from 50 to 100 gallons of ice cream per day. Eighteen months later they moved into their present location, at 306 Madison street, installing modern equipment, which now has a capacity of 1,000 gallons per day.

Miss Mary Weber, now Mrs. F. N. Raithel, joined her two brothers in the partnership and later incorporated under the name of the Weber Ice Cream Co., John J. Weber, prsident; A. J. Weber, vice-president, and Mrs. F. N. Raithel, secretary-treasurer.

In 1916 the Weber Ice Cream Co. added a creamery to their plant, making about 500 pounds of butter per week. The dairy business being very poor in this part of Missouri at that time, but after the farmers found a ready market for their cream at Weber's Creamery, they soon began to buy cows, which increased the flow of cream, and now the Weber Ice Cream Company is making from 6,000 to 8,000 pounds of Blue Grass Creamery Butter per week, paying to farmers for cream nearly $10,000 per month.

In 1917 the Weber Ice Cream Company opened a new ice cream factory at Moberly, Mo., A. J. Weber managing that plant, which has also a capacity of 1,000 gallons per day, and doing equally as large a business as the Jefferson City plant. February, 1921, the Weber Ice Cream Co. contracted an agency for Weber's Carbonated Ice Cream with Stotler & Hinds, Fulton, Mo., who always carry a stock of two hundred gallons to take care of the business in and around Fulton.

May 1st another factory was started in Sedalia, Mo., with a capacity of 500 gallons per day, and from late reports they will be compelled to build a new factory to take care of the increasing business.

You can buy Weber Carbonated Ice Cream in nearly two hundred towns in Missouri, being advertised extensively as exclusive manufacturers of Carbonated Ice Cream, which has opened up a new era in the ice cream business. They have recently had an inquiry regarding the carbonating process from caterers from New Castle on Tyne, England.

The number 13 has played an important part in the success of John J. Weber, who was in business at 413 N. Hickory St., Joliet, Ill., and in 1913 started business in Jefferson City, later opening a plant at 513 Coates St., Moberly, and again at 413 S. Engineer St., Sedalia, Mo.

The Weber Ice Cream Company is to-day employing thirty people. When they started here they did the work, John J. Weber making the ice cream, A. J. Weber assisting, and one driver.

Webers have always taken an active part in the upbuilding of the community and are members of all the leading organizations of the city. Their plant is considered a valuable asset to the community.

Ice Cream Freezer Selection Includes One of Four Choices

By W. C. DAVIS, President, Davis-Watkins Dairymen's Manufacturing Company

The rapid growth of the dairy industry here in America has been greatly assisted during the last few years, because of the rapid development and growth of the ice cream branch of this mammoth business. We who have been closely associated with it have found difficulty in anticipating the rapidity with which it has been necessary for us to keep pace. However, in looking back over the experience of the last three years, I am confident that we machinery manufacturers have accomplished a great deal more than we originally thought could possibly be accomplished in so short a time.

W. C. DAVIS

There are really four distinct classifications, or divisions constituting our sales work in the building of efficient ice cream plants. These four classifications are primarily based on the kind and character of machines selected for the ice cream freezing department. Any man entering on, or building in this particular line of work, must at the outset form a definite conclusion in his own mind as to the size and character of the freezer installaton in the freezing department. Around this he builds the rest of his business, in order to conform to the requirements of the freezing department. These classifications include really only three groups, that is 40, 50 and 100 quart machines, with one of the group divided into two: or taking it another way, there are two groups, that is, brine and direct ammonia expansion, with one divided into three sections.

I will enumerate all four divisions, permitting you to make your own decision as to how these may be grouped; endeavoring to explain in detail, as we go along, the characteristics of the machines coming under the several divisions.

40-Quart Vertical Brine Freezer.

This type of machine is about as old as the ice cream business itself, having been developed as the business has grown. There are perhaps more ice cream plants fitted out with these machines than any of the other divisions, and that is why we consider this machine first.

Almost every large city, and most of the smaller ones, have ice cream freezing departments equipped with these machines. There are perhaps a great many more small plants with one, two or three machines of this character, than there are of any other. The years of practical experience with this machine have permitted a standardized machine of great efficiency, and one which can be made in quantities at a low cost.

Anheuser-Busch Sales Corporation, New Orleans, La., Branch.

Vertical machines have certain natural advantages which it has been hard to overcome in the other types. They are rapid freezers. The position of the cream in the cylinder has much to do with their popularity. The brine enters in the bottom of the cylinder, and this affords direct application of the greatest amount of cold to the largest quantity of cream.

The weight of the cream itself being forced down by the force of gravity, makes it a simple matter to discharge the frozen cream from the cylinder through a small opening without mechanical means.

The dashers in these machines have, as the years passed, been greatly improved, and with the new type of squirrel cage dasher, it is a simple matter to secure a full overrun in an unusually short time, many concerns freezing as high as five batches per hour.

The Reich-McJunkin Co. in Pittsburgh, have thirty-four of these machines in one room, all of which have been operating over a period of more than ten years. Right in the same city, in the plant of the Ohio and Pittsburgh Milk Co., there is a battery of twelve freezers which have been in operation for a similar period. If you will take the time to visit large ice cream plants in Philadelphia, Boston, New York, and many other eastern cities, you will find them highly satisfactory users of the vertical type machine.

Our former sales manager

KEEP OUT OF THE RUT.

Rockford, Ill., Sept. 1, 1921.

The Ice Cream Review:

I shall be in Minneapolis at the national convention personally and using all my personal effort in interesting ice cream manufacturers in Illinois to go and take advantage of an opportunity like this to learn more of their own business. We are very apt to get into the rut of thinking that our own particular business cannot be run on some one else's suggestions. I have always found that at every meeting of the association I attended, I learned something new.

To the Illinois Ice Cream Manufacturers I say, ATTEND THE MINNEAPOLIS MEETING; learn what the other fellow is doing and I know you will come home with a better knowledge of the business and at the same time know something of the good fellowship of your competitors.

GEO. R. COURTRIGHT, President.
Illinois Assn. Ice Cream Mnfrs.

Get the *bigger* business that looms behind your Fall sales

YOU'VE got two salesmen working for you: Heat and Taste. Heat quits for half the year, but Taste is a *sticker*. He works *all the time*.

Hundreds of manufacturers of ice cream, water ices and sherbet are building up their Fall and Winter business by making products so tasty, so rich, so smooth that folks keep up the ice cream habit, heat or no heat.

And among the greatest helps these manufacturers have are

GUMPERT'S

Ice Cream Improver

Far more completely than Nature alone, Gumpert's Improver breaks down and softens the milk solids that surround the globules of fat in cream. The higher proportion of butter fat thus released and the more thorough softening of the solids, give ice cream a finer, richer taste and a smoother, more velvety texture.

Textor

For Water Ices and Sherbets

Textor eliminates the rough and uneven grain usually present in water ices and sherbets. It gives a smooth, even, luscious texture without ice crystals or lumps.

And no matter how often repacked, water ices stabilized with Textor will harden uniformly and smoothly.

S. GUMPERT & CO., Bush Terminal, BROOKLYN, N. Y.

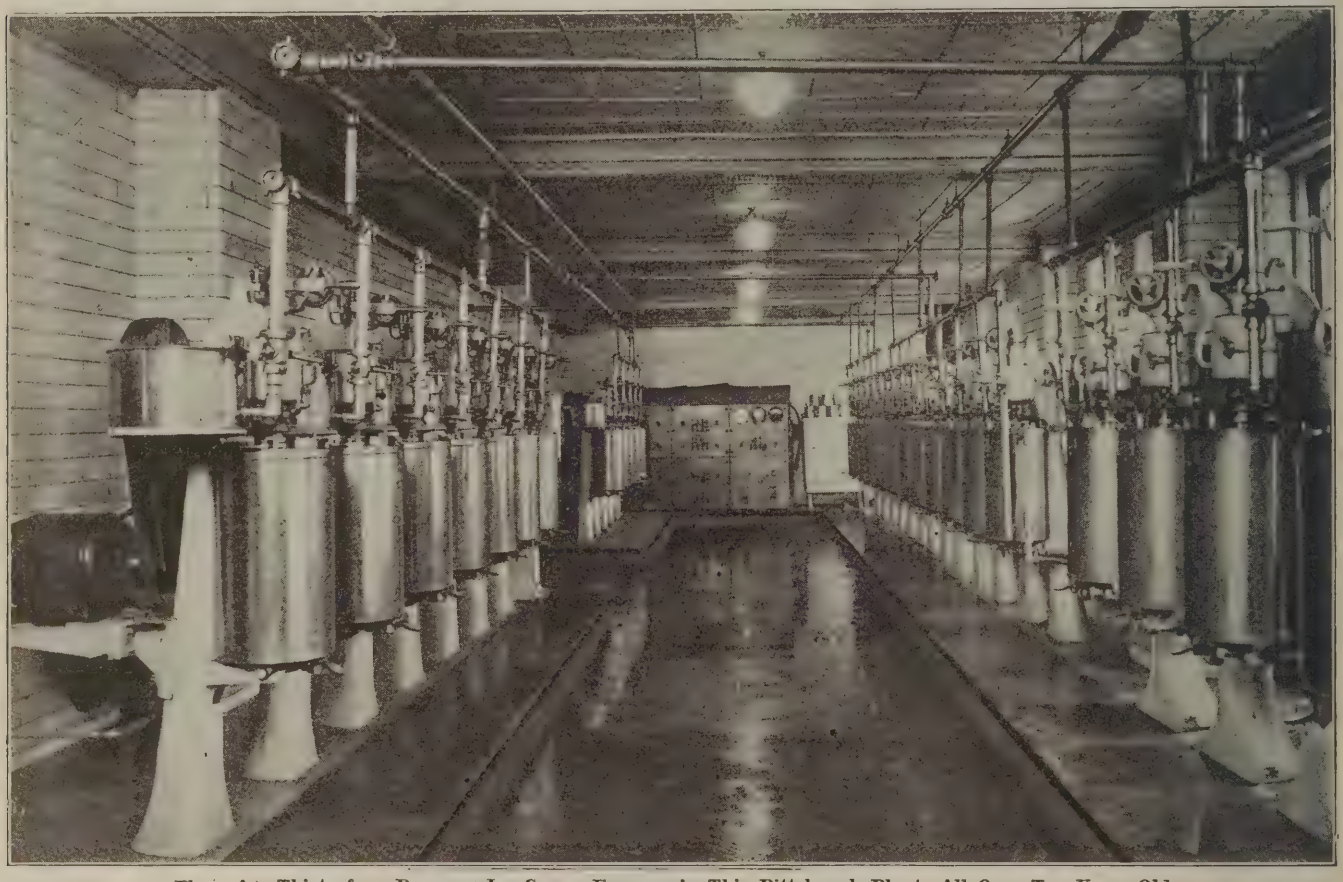
started to use ice cream equipment as the Hughes Ice Cream Co. in Los Angeles, Calif., was so thoroughly sold on this particular style of machine that he would have no other. St. Louis has many vertical machines, and if you will visit the smaller cities, you will find these machines predominant.

It is customary among manufacturing concerns, when they enter a field, to grab the new ideas and compete with machines by developing rather than to try to compete with old, efficient, established machinery strongly protected by patents. It is largely for this reason that there is so little competiiton among the manufacturers on this vertical type of ice cream freezer.

50-Quart Horizontal Brine Freezer.

These machines, while not as old as the vertical type, have been rapidly developed during the last five years. There has been such keen co-operation among the manufacturers, that it has resulted in each of them making an effective 50-quart brine freezer.

These machines have been improved so as to include characteristics, which must to a large extent offset the advantages of the vertical machine. We refer particularly to the double entry and discharge for the brine, and scraper blades on the outside of the dasher, placed there to facilitate rapidly emptying the cylinder of the frozen cream.



The double flow of brine is a wonderful improvement. In this the flow of brine is divided so that half of it enters the outside jacket at the discharge end of the cylinder, and flows out near the middle, the second brine pipe operating on the back half of the cylinder. In the latest machines these brine pipes are equipped with thermometers, so that at all times the efficiency with which the machine is operating is known.

The latest of these machines are equipped with a squirrel cage dasher. The inside part revolves one way, and the outside part another.

The inside part of the dasher is really built very similar to a squirrel cage of the old fashioned type, which has a ring at each end, and numerous steel, tinned rods connecting these two rings. This applies the "fork" principle in properly beating air into the mixture.

The outside part of the dasher has two sets of scraper plates. These scrape the outside of the cylinder, forcing the mix in the center where it is beaten up by the rods. Originally the scraper blade was made in one long segment. Now it is made in numerous parts, or small sections. The reason for this is greater efficiency.

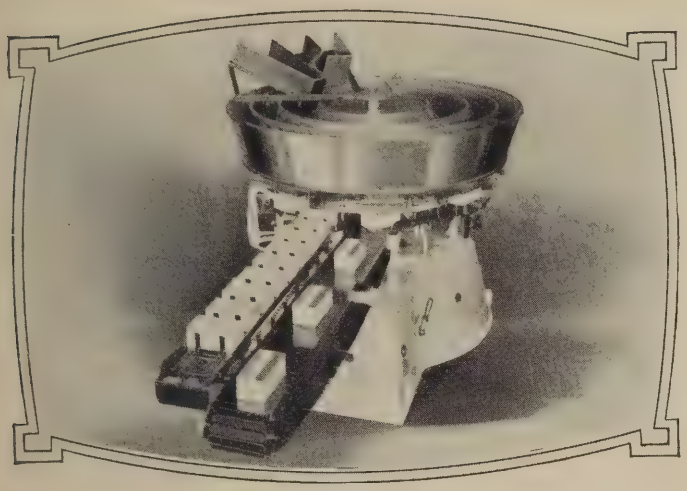
The second part of the outer dasher is equipped with diagonal scrapers, which come close to the side of the cylinder, and are so arranged that they continually force the contents toward the discharge end of the cylinder. This facilitates a rapid discharge of the contents from the machine.

There Are Thirty-four Progress Ice Cream Freezers in This Pittsburgh Plant—All Over Ten Years Old

Recent developments have made it possible to so attach this dasher to the gear end of the freezer, that there is no need for oil on the connection. Much trouble was originally caused by machines of this type owing to the fact that when the dasher was pulled out of the cylinder, it invariably dropped grease or oil on the inside.

The Corbett Ice Cream Co., Denver, Colo., is a very good example of such an installation. They have six of these efficient machines in their modern plant.

100-Quart Horizontal Brine Freezer.



These machines have been developed for the man who has a large business, and decides to freeze a larger quantity of cream at every operation. These machines take up very little more room than the one last mentioned, yet have a double capacity.

In construction they are just the same as the 50-Quart brine machine, both as to gearing, dasher, stand, and appearance.

(Continued on page 61)

C.E. Rogers DETROIT

Automatic Brick Maker 1200 to 1800 Per Hour

THE Rogers rotary machine will fill from 1200 to 1800 Neapolitan or solid-flavor bricks per hour—ready for the hardening room. The Neapolitan bricks are mechanically and accurately portioned, the dividing line between flavors being sharp and straight. With a special conveyor the filled boxes can be carried directly to the hardening room at the same speed of the machine.

The labor-saving effected by this machine is remarkable. Only two people are required—one to feed the empty boxes into the machine and another to put the covers on as the filled bricks pass by on the way to the hardening rooms. By the use of a paraffined carton extra wrapping is eliminated. The carton covers, or tops, carry the brand name and decorative colors on five sides, making the package unusually attractive. When this package is opened by the consumer the cover is removed, the ends of the container are easily detached and all sides are turned down, leaving a perfect brick, free from muss, ready for the cutting knife.

In making Neapolitan bricks the three flavors pass from the freezers directly into the hoppers of the machine. This can be accomplished by gravity or in any manner best suited to your freezer arrangement.

A Rogers brick maker has been in practical operation in a large Detroit plant during the 1921 rush-season—and under constant and critical observation for the purpose of ascertaining the slightest defects in operation and utility. It is only after the most thorough tests, under rush-season and rush-day pressure, that we are prepared to announce a mechanically perfect machine backed by a Rogers guarantee of performance.

The machine occupies a floor space of 5′ 8″ x 10′ 1″ and is 5′ 5″ high. It is mounted on wheels, being portable and easily pushed aside after the run is completed. (The accompanying illustration of the Neapolitan brick is from an actual photograph and shows the straight-line flavor divisions.)

Dear Sirs:

Enclosed is standing order covering monthly shipments of your Concentrated Vanilla, No. 52.

In renewing our order we would like to compliment you on the product you are putting out, and also the service you have given us. Your product has the true vanilla flavor which lasts, uniform in quality and distinctive.

Thanking you again for your prompt service, and trusting you are enjoying a nice season, we remain,

Yours truly,

Name furnished on request.

Concentrated Vanilla No. 52

You will be interested in the saving afforded in using our concentrated vanilla as mentioned in this letter. Write us for details.

ıe Hudson Policy

NCE 1888 we have been serving the ice cream industry. We began in a small way—in fact, those were "pioneer days" ıs, just as they were then for the comparatively few ice n manufacturers. Our business relationship was very in-te. The industry was still in its "swaddling clothes." There still unsolved, mutual problems to meet. This early ıate business relationship promulgated a spirit of working ther. And, because of the confidence thus established, it rally followed that we recognized, in a most significant the obligation necessarily imposed upon us—that Hudson illa Products should at all times be of a dependable, rm, high-grade quality.

his became, as it is now, the per-eating spirit of our organization. is the only policy we have. It has een the bulwark upon which our usiness has grown thru all these ears. And, today, it is indeed grati-ing to go thru our files to find tter after letter, of various dates, from old and new customers, all expressing their appreciation of the Hudson Policy. We illustrate, herewith, and with pardonable pride, one of many such letters received. Of course, we shall continue to hold true to the standard that merits such letters.

Hudson's Famous Ice Cream Flavor Vanilla and Tonka Blend No. 52 Special is First by Merit. You Will Like to Use It.

4 True Servants

There is probably no appa
ratus that has done more to establis
operating efficiency and economy in th
ice cream industry than the Mojonnier equipmen
which is briefly described herewith.

Patented.

Mojonnier Milk Tester in the Laboratory

This apparatus determines accurately the butter fa
and total solids in all classes of dairy products. I
enables the ice cream manufacturer to purchase his raw
materials intelligently, paying only for actual amount o
butter fat received; also to standardize his mix to withi
.05%, insuring absolute uniformity and eliminating al
guess work. One percent excess butter fat means a los
of 5.4c per gallon of mix, while 1% excess total solid
means a loss of 2.5c per gallon. Figure it out for your
self and see how many times this device will pay fo
itself in your plant, then let us send you our bulleti
giving full particulars.

Mojonnier Vacuum Condensing Unit in the Mixing Room

App. & Process
Pat. Pend.

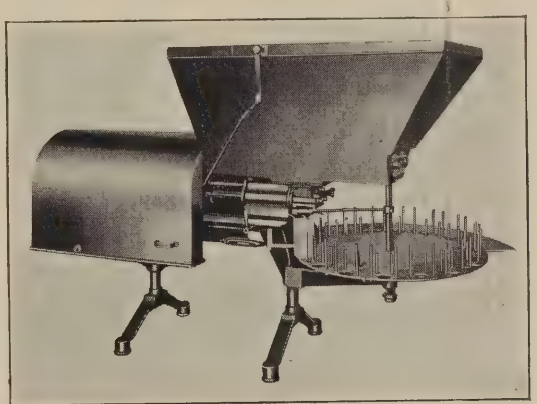
The Mojonnier Vacuum Condensing Unit represent
another efficient achievement that is fast being adopte
by enterprising ice cream manufacturers. By displacin
his pasteurizer and mixing tank with a Mojonnier Vacuu
Condensing Unit, the manufacturer is enabled to no
only make his mix from fresh milk direct from produce
but also take care of his surplus. Several manufacturer
have in this way decreased the cost of their mix 15c pe
gallon. When there is a surplus of fresh milk above tha
required for making the regular run of ice cream mix, i
can be converted into sweetened condensed milk or som
other condensed milk product for which there is alway
a ready sale, eliminating all losses thru waste and con
verting them into actual profits. Investigate the possi
bilities of the Vacuum Condensing Unit in your plant

Be Sure to See Them at the

to the Ice Cream Industry

Mojonnier Over-Run Tester in the Freezer Room

Pat. Pend.



Every ice cream manufacturer knows what the over-run, or swell, means to him. Good over-run means a nice profit at the end of the year. Insufficient over-run means an actual loss.

By the aid of the Mojonnier Over-run Tester, you can control your over-run absolutely. Each percent of over-run is worth .4c per gallon of ice cream. Frequently the flavor and texture is improved by changing your ratio of fat and solids not fat, and increasing the over-run. If you can increase your average over-run only 10%, it means a saving of 4c a gallon, or $4,000 a year on 100,000 gallons.

If you are interested in saving these extra profits, write for more complete details of the Mojonnier Over-run Tester and proof of what it is doing for others every day in the year.

Mojonnier Ice Cream Packing Machine in the Packing Room

Here is a packing machine that is an indispensable acquisition to the ice cream industry. All but human, it automatically packages ice cream just as it comes from the freezer, one, two or three layers at the same time. Fills either quarts or pints, in either one, two or three flavors. Eliminates pouring into molds, dipping, cutting and wrapping. Delivers cream from freezer to package without being touched by human hands and insures absolute uniformity of measure. Capacity twenty quarts per minute or 1200 bricks per hour. Whether your plant is small or large, you cannot afford to neglect the great opportunity for cost-saving which the Mojonnier Brick Machine offers. Investigate our easy purchase plan.

Patented Dec. 17, 1918.
(Process and Other Patents Pending)

Mail the Coupon

For your own advantage and to give you an opportunity to thoroughly investigate the incomparable benefits to be derived from Mojonnier Efficiency Equipment for Ice Cream Plants, let us send you full and detailed information on any or all the devices here referred to. Use the coupon herewith. Check the equipment in which you are especially interested and you will have made the first step to new and decidedly attractive profits.

(Continued from page 56)

On each of the machines, the gearing arrangement is carried on the rear end of the stand, with gears similar to those of the transmission on automobiles, and which continually run in oil.

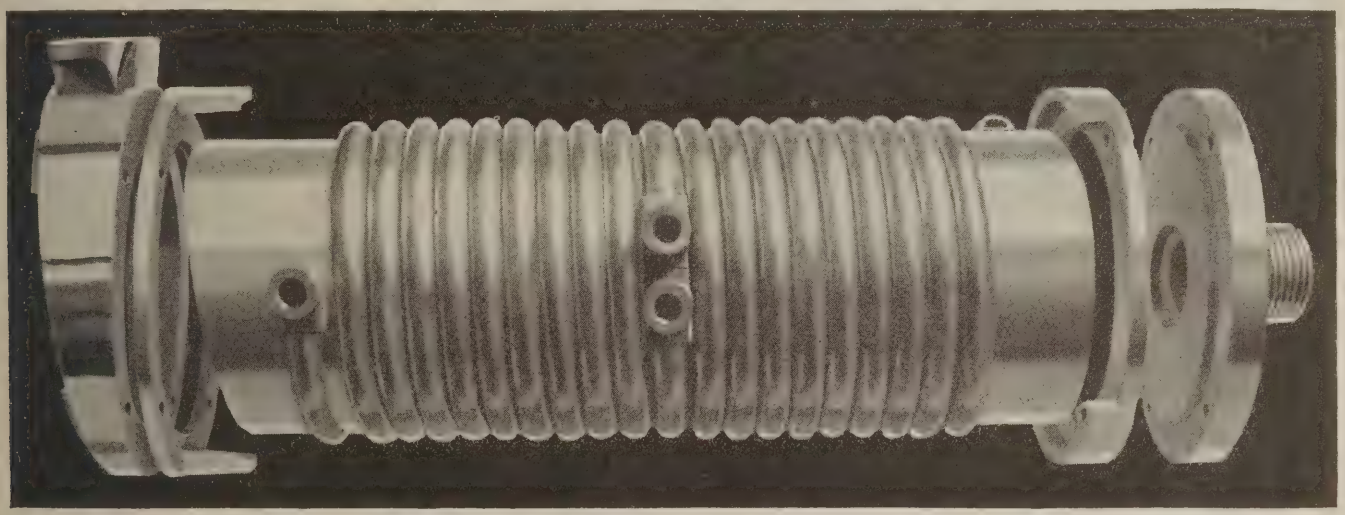
Recent developments in these machines have permitted the placing of the motor on a platform over the freezer cylinder. This makes it a very close connected proposition, and gives the right balance to the machine so that it is not as easily upset as are some other types.

Speaking of motors, practically all the ice cream freezers we sell today, are individual motor driven. This does away with all overhead shafting and belting, and much of the dirt and grease which no ice cream manufacturer can afford to have in his ice cream freezing room. It also does away with considerable expense when the machines are not actually running.

Progress Freezers Owned by Corbett Ice Cream Co., Denver, Colo.

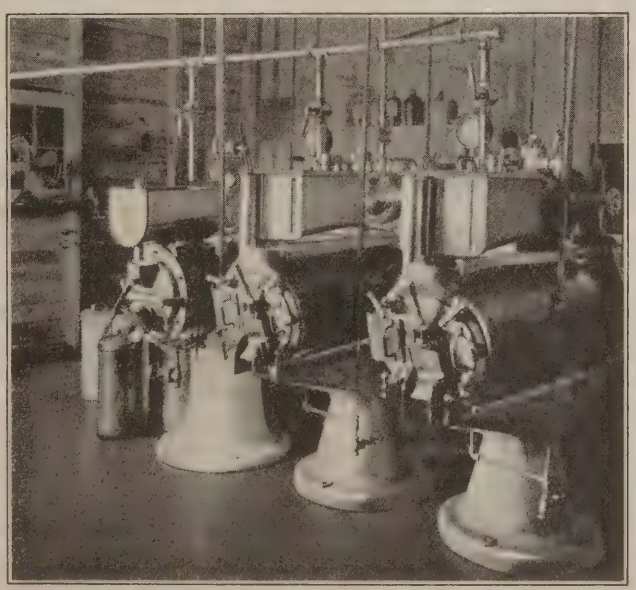
Many large concerns are now putting in batteries of these machines. One of our recent installations is that of four of these large machines in the New Orleans plant of the Anheuser-Busch Sales Corporation.

50-Quart Horizontal Direct Ammonia Expansion Freezer.



This type of freezer is comparatively new, but wherever we have put in installations of this character during the last year, our customers are satisfied, and some of the most enthusiastic boosters we have.

In this type of machine liquid ammonia is injected into the jacket of the freezing cylinder, from the bottom through a quarter inch pipe. As this ammonia acquires heat from the contents of the cylinder, it is transformed into a gas. This gas is carried back to the compressor and from there to the condenser, where it is reduced to a liquid form.



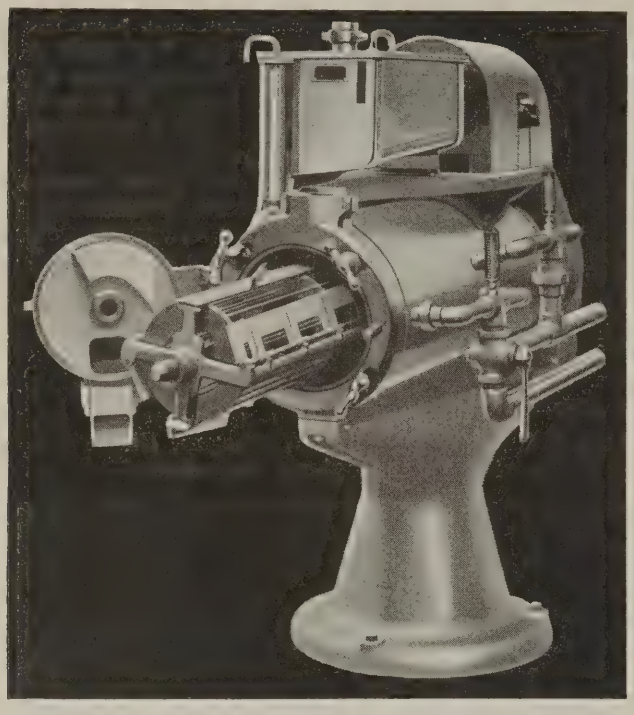
This system does away entirely with all brine connections, brine box construction, etc. In theory it is truly the most ideal ice cream equipment a man could have. In practice is proven the correctness of the theory.

With direct ammonia expansion freezers of the latter type, you secure each of every advantage of the brine machines, and at the same time have certain advantages that the other machines do not have.

A recent example of this classification is the Durkin Ice Cream Plant at Waukegan, Ill. They operated two of them throughout the season.

Cylinder of Progress Horizontal Brine Freezer.

Durkin Ice Cream Co., Waukegan, Ill.



General Information.

Never has the ice cream industry had a better or more profitable year than the one just closing. They have been selling ice cream on a declining cost market, and besides this, they have had a long, hot season in all parts of the country.

Ice cream is undoubtedly a seasonable product, although recent years has seemed to tend to a general consumption. I believe that if statistics were collected together, it would doubtless show a large increase in the consumption of ice cream in the off season months. But, perhaps the increase in consumption in the seasonable months would show about the same percentage of increase.

Realizing this condition, it is of special advantage to any man in the ice cream business, to use great care

and splendid judgment in making his selection of freezers, as well as the other equipment. He must have equipment of sufficient capacity to handle business in the good season, and at the same time be careful not to arrange for an overhead expense which will cripple his efforts in the off season. It is overhead expense in the off season, which always produces the greatest hardship any manufacturer has to contend with. You should plan to avoid it as much as you can.

Progress Horizontal Ice Cream Freezer Door Open, Dasher Part Way Out to Show Construction.

This circumstance offers a special inducement in favor of two of the types of freezers mentioned above. We refer to the vertical machines which cost little money, and direct ammonia machines which reduce the amount of money needed for accessories.

WORK ON NEW QUARTERS FOR KREAM OF KREAM ICE CREAM PROGRESSES.

Work of fitting up the new quarters of the Dryden Corporation, manufacturers of Kream of Kream ice cream at San Pablo avenue and Fortieth St., Alameda, Cal., which will be ready for occupancy by October 1, is progressing rapidly, according to R. J. Dryden, president and general manager of the company.

Within the next two weeks, according to Mr. Dryden, construction will be started on the huge cold storage plant to be part of the equipment of the new factory. All of the ice cream manufacturing and mixing machinery will be located on the ground floor of the new plant. Large loading platform will be located in the rear and on one side of the new plant, the rear platform being used for local automobile and wagon delivery and the side platform for rail transportation, a spur track owned by the company running alongside of the new plant. The offices and storerooms of the company will be located on the second floor of the building. The cold storage plant at the new factory is specially designed to accommodate the standard five gallon containers in which the company ships all of its product.

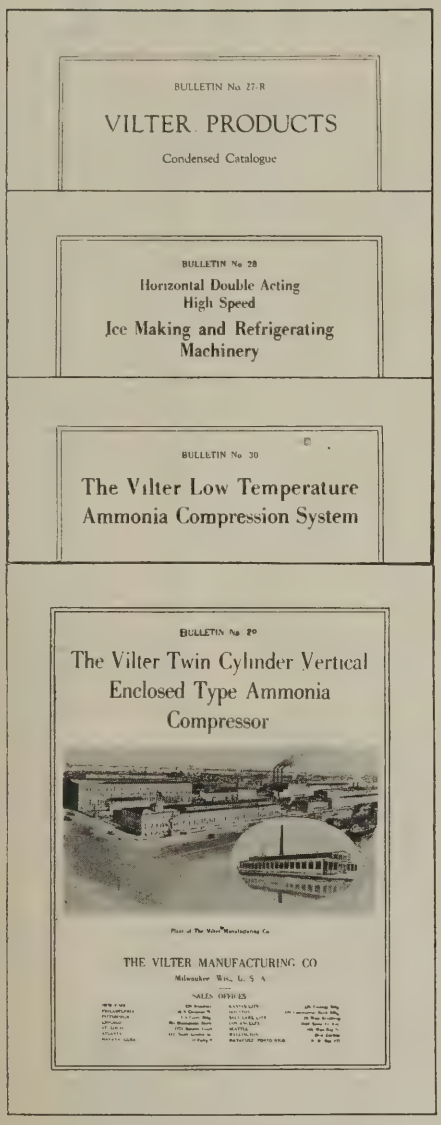
SPECIAL ADVERTISING TO THE LITTLE FOLKS.

(Concluded from Page 16)

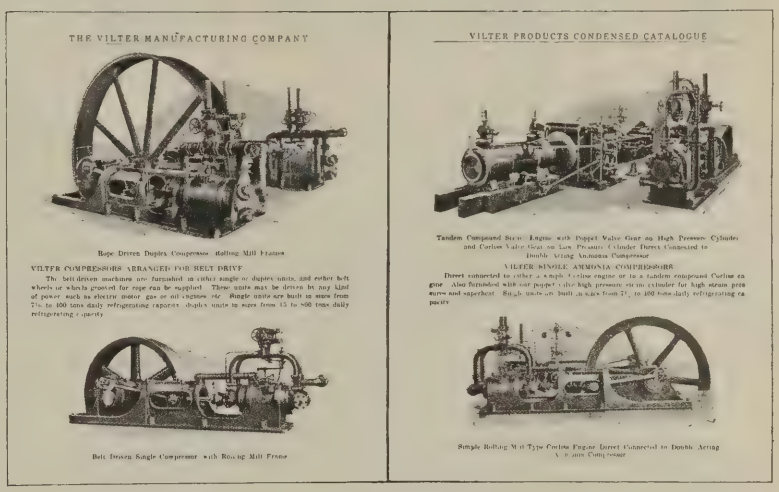
appeal. The artist has used great care to show the characters in such a way that the children will recognize them and the result is a series of pictures that the children like to cut out and paste in scrap books.

Besides running this series in the newspapers a large sized window poster in three colors showing the same pictures and rhymes appears in all the dealers' windows. Later it is planned to show motion pictures to carry out the same idea. It is pretty safe, Printers' Ink concludes, that the children of the South will soon be repeating the Chapin-Sacks rhymes with all the gusto they have had in quoting their old nursery verses, and although the adults are left out of the appeal a few thousand children trying to get their parents to buy the Velvet Kind Ice Cream stand a pretty good chance of making the campaign a success.

Reproduction of a Chapin-Sacks Advertisement.



To return for the last time to the editor's "holler for help." He says he wants to have us reap some benefit for ourselves out of this article so he is going to allow us to say a word about our own product, namely, ice cream and dairy equipment. Quite a jump from "Mother Goose" rhymes, you think, but really its no jump at all from the ice cream itself and the Velvet Kind in particular. We'll whisper this: The Chapin-Sacks Corporation have used Manning equipment since long before the war, and when a concern of their prominence uses some of our apparatus we can't help but feel that we've got a product worthy of any ice cream manufacturer's most careful consideration.



Emphasizing the Merits of "The Velvet Kind."

At any rate we're going to exhibit some Manning Batch Mixers and Can Washers and Dryers at the National Dairy Show, to say nothing of Tubular Milk coolers, Condensed Milk Coolers, a brand new Automatic High Pressure Bottle Washer, a Cream Ripening Pasteurizer, a good line of Sanitary Bottle Delivery Cases and some other equipment that is used extensively throughout the dairy industry and which we believe you ought to see in actual operation. Our headquarters are main entrance spaces 36 to 42, inclusive, and we hope you'll drop in on us and that we'll all have a good time. We thank you.

VILTER BULLETINS

¶ Prepared for you and available on request together with such other information as may be desired.

¶ When in need of equipment whether it be some new material or a complete plant of the largest size, we would urge you to investigate what we have to offer as our extensive experience in this field together with our large well equipped shops enables us to offer the correct equipment for any particular requirements.

Our Representatives and exhibit will be in booth 355 at the coming National Dairy Show

SERVICE—NOT JUST EQUIPMENT

GLASS ENAMELED STEEL EQUIPMENT

WHAT do you buy in Glass Enameled Steel Equipment? Efficiency of design and construction; strength and resistance to wear; mechanical perfection—but—over and above all; *you buy profits*, realized through maximum production at minimum cost. Just how Elyria can give you this profit, one of our Sales Engineers will explain—after he has made an inspection of your plant and decided upon the correct units and plant layout to use.

An interesting example of Elyria efficiency is demonstrated by the installation at the plant of the Evansville Pure Milk Company, Evansville, Indiana. Two 500-gallon Elyria Pasteurizers and two 500-gallon Equalizing Tanks are used. Milk is passed through the plant in one continuous system [as illustrated in the picture at the left] and a valuable saving of floor space, time and labor is effected. The plan of operation and the economies realized will be shown to you if you so desire.

You will be interested in having complete information on Elyria Equipment—mixers, storage tanks, weight tanks, pasteurizers etc., for the Milk and Ice Cream Plant. A letter will bring proof of Elyria superiority at once.

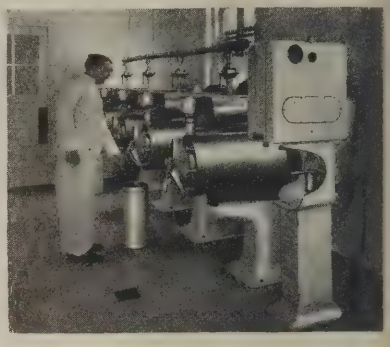
Elyria makes Glass Enameled Truck and Car Tanks, too. If you are interested in this efficient and economical method of milk transportation, we shall be glad to show you how Elyria Equipment will fit into your plans. We have some very valuable and interesting information on the subject.

SERVICE—NOT JUST EQUIPMENT

From Nothing to $100,000



A FEW years ago a young man named Peter Cavallini opened a small confectionery store in Blue Island, a suburb of Chicago. Cavallini's capital was limited indeed, but even if he did lack capital he had qualities which in business were more valuable than money, for he believed in serving his customers to the best of his ability and in supplying them with quality goods. Today he is partner in five other flourishing confectionery stores in company with his brother Dewey, and controls a prosperous wholesale company, a candy factory, and a new completely equipped ice cream plant having a capacity of 600 gallons of ice cream a day, capitalized at $100,000.

View of Two CP 6-Ton Refrigerating Machines With Ice Making Department in Left Background.

Mixing Room Showing Wizard Preparation and Mixing Vat, Alaska Tubular Cooler, Gaulin Homogenizer, and Two Wizard Holding Vats.

Mr. Cavallini and Four Ft. Atkinson Horizontal Freezers.

Although a young man both in years and in experience with American business methods, Mr. Cavallini knew intuitively that nothing would succeed as well as quality goods. Consequently every piece of candy he made and every ice cream soda he served was as good as excellent materials and human skill could make it.

When he decided to make his own ice cream he determined to produce the finest ice cream that money could buy. To do this he realized he must have the finest equipment he could secure. He knew the first cost of such equipment would be somewhat higher than something else that might suffice, but at the same time knew that quality equipment would make it possible to produce the finest goods and furthermore, because of reduced up-keep expense, would be the most economical.

As Mr. Cavallini is a careful, conservative business man, he spent considerable time and money in investigating ice cream plants everywhere. He soon discovered that whenever he found a company producing an unusually excellent ice cream, first class equipment largely predominated.

As a result the Cavallini plant is an up-to-date plant from roof to cellar and, of course, the cream he produces, wins favor wherever tasted. It naturally follows that the demand for Cavallini cream was far greater than the ability to produce it.

The outstanding feature of his equipment, as Mr. Cavallini sees it, is the splendid appearance made by his plant because most of the machines are white vitrified porcelain enameled; the compact arrangement of his machines and the freedom from any defects in machinery. The plant has run like an eight-day clock since it was first opened. Visiting ice cream men have specially complimented him on the compact, ingenious arrangement of his mixing room.

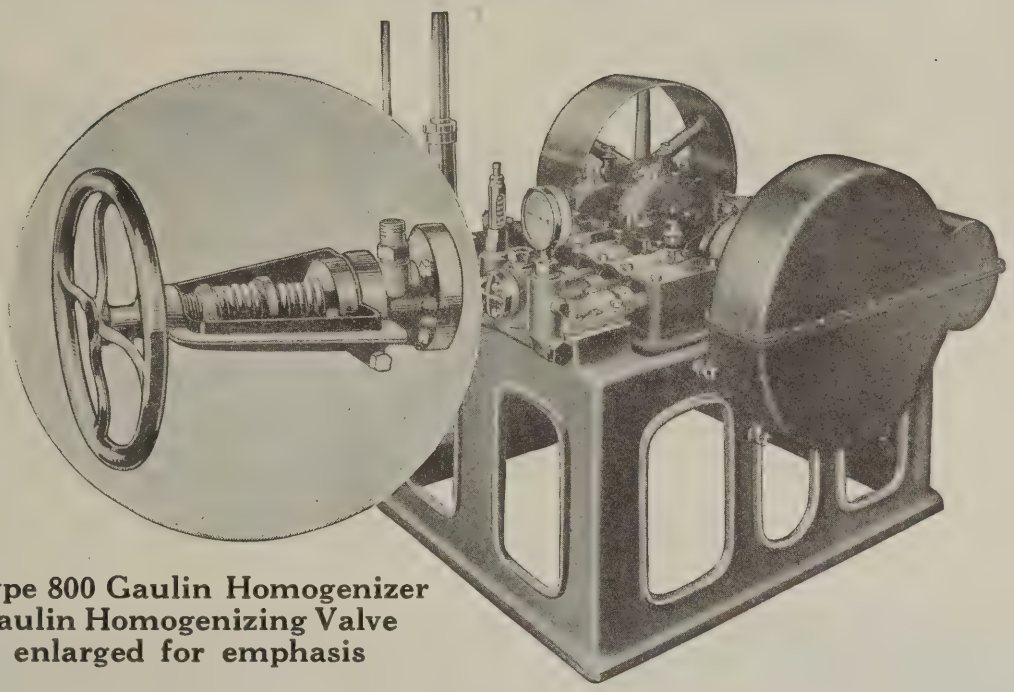
Cavallini purchases pasteurized cream from a neighboring dealer and it is emptied into a Wizard vat on the first floor. From there it is pumped to another vat on the second floor where the mix is prepared in a Wizard vat. From there it is drawn into a Gaulin Homogenizer and the whole mix homogenized under pressure of 3,000 to 3,500 lbs. per square inch, thoroughly pulverizing and emulsifying every atom in the mix. The mix is then pumped over an Alaska tubular cooler and cooled to 30 degrees. From the cooler it goes into two Wizard aging vats and there held for 24 hours. Four vitrified Ft. Atkinson freezers are located on the floor below and the mix is drawn into them from the aging vats by gravity.

Refrigeration for the plant is supplied by two six-ton vertical refrigerating machines. These machines also provide freezing for the ice tank as the Cavallini Ice Cream Co. make their own ice on the premises. The ice is broken in a Victor ice crusher. Dirty packing cans are rinsed, washed and sterilized with a No. 2 Ft. Atkinson can washer. In order to induce the employes to maintain scrupulous cleanliness in the plant, they will be kept supplied with clean, white Duxbak duck clothing. They also plan to use Germ-X liberally for all cleaning purposes in order to keep the plant and utensils in a sterile condition.

THE WISCONSIN ASSOCIATION OF ICE CREAM MANUFACTURERS.

It is certain from remarks heard from the ice cream manufacturers of the state of Wisconsin, that a very large delegation will attend the National Convention of Ice Cream Manufacturers to be held in Minneapolis.

The trip will be a very pleasant one and every manufacturer should attend this convention. Our state is the leading dairy state and should be largely represented.



The knowledge gained at this convention will repay each manufacturer for the time spent.

Let's all get together and boost this convention; we owe it to our industry.

D. D. SMITH, President.

Read the letter from L. Manuel Hendeler on page 122 of this issue.

Who Is The Leader
In Your Community?

The Type 800 Gaulin Homogenizer with Gaulin Homogenizing Valve greatly enlarged for emphasis

An ice cream plant owner is in business primarily of course to make money, but most operators aspire as well to establish a reputation of leadership.

Leadership in the ice cream business as well as in the automobile business or department store business is founded on Quality Goods. Once the public realizes that your ice cream is better than the other fellow's, they will give you the bulk of their patronage, even if your cream costs a little more.

In order to make Quality Goods you must have the best equipment possible, and the foremost quality-producing piece of equipment in any ice cream plant is a Gaulin Homogenizer, because it has the Gaulin Spring Homogenizing Valve. This machine enables the owner to turn out a product that is far superior to that obtained from any other machine purporting to do similar work to the Gaulin, as the product is broken up in finer particles and is uniform throughout.

Every part of the Gaulin is hand made by skilled machinists from the finest materials. As a result, the Gaulin Homogenizer does its work quietly, and gives good service for years. Its product cannot be approached for uniformity and smoothness. Don't fail to write NOW for booklet, "The Story of the Homogenizer."

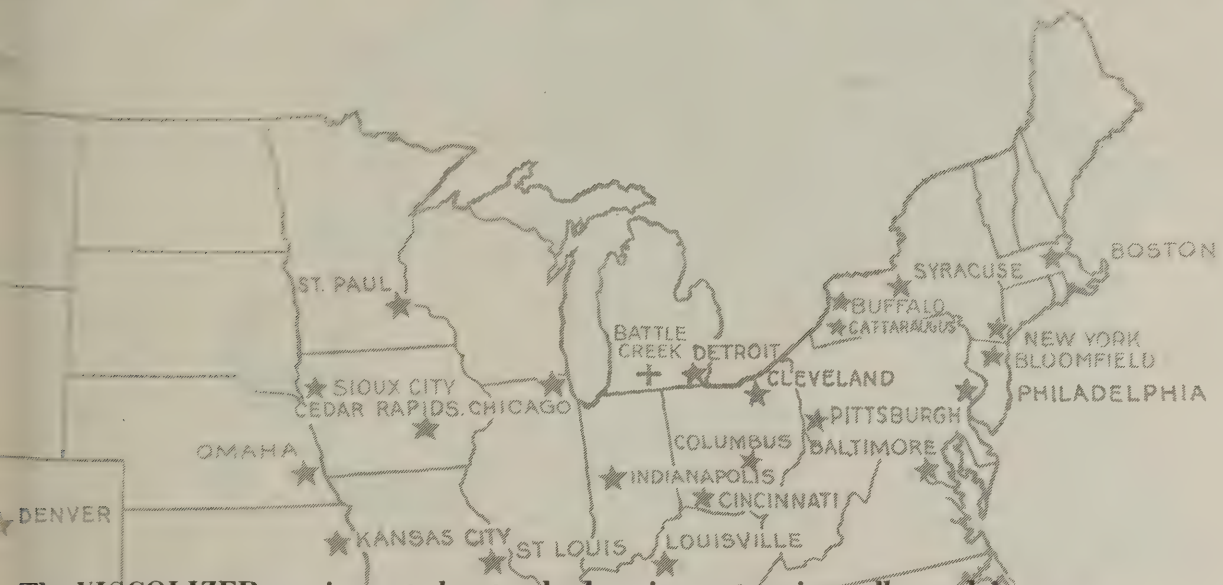
Meet Your Jobber and See

The Viscolizer

on display at the



Great National Dairy Show

Minnesota Fair Grounds, Minneapolis, Minn.

October 8th to the 15th, 1921

VISCOLIZER EXHIBIT NAT'L DAIRY SHOW, CHICAGO, 1920

The VISCOLIZER continues to be standard equipment, universally used, in manufacturing plants throughout the United States, primarily because its wonderful performance has given universal satisfaction.

The merits of the Viscolizer have become established facts to those who are well posted. The sturdy construction of the machine frees the users from breakdowns. A very hard and non-scoring viscolite metal is used for the valves.

The option to the buyer of a differential or fixed-orifice valve, or the automatic Pressure Regulating Valve on the Viscolizer, and the fact that the Viscolizer is made in all sizes and to fit all requirements, gives the purchaser an opportunity to select a machine which will ideally fit his requirements.

The manufacturers and distributors back of the Viscolizer have constantly anticipated the demand and have made the Viscolizer of such quality and in such quantities and distributed it in a manner so thorough, that a remarkable price reduction and capacity increase is now possible. These new prices will become effective the opening day of the show and continue throughout.

This price reduction is a master stroke to bring the Viscolizer within the purse range of all. The art in the manufacture of the Viscolizer and the material used is exemplified in the achievements of this machine in behalf of ice cream makers and milk dealers in every dairy section.

It will pay you to hold up that purchase until after you have seen The Viscolizer and hear the new materially reduced prices, at the Dairy Show. Make our booth your headquarters. You are welcome.

What the National Dairy Council has to Say about Ice Cream

THIS article, with its illustrations, is made up of selections from National Dairy Council literature upon ice cream. It is recommended that you pass it on to your local papers. Help tell the story of ice cream as an all year food. "Ice cream," says the National Dairy Council, "is not a luxury; it is a highly nutritious food."

During the past four years science and necessity have taught us many things about food. Some things we once thought indispensable as food, we have since found wholly unnecessary. Others we thought of only as luxuries, we have found are food necessities.

Ice Cream produces energy and removes that tired feeling

(From the National Dairy Council's New Booklet on Ice Cream.)

Mother knows that Ice Cream makes healthy Children

(From the National Dairy Council's New Booklet on Ice Cream.)

Ice cream a short time ago, was thought of and used only as a luxury, but during the war it was declared by the government to be an essential food. Science and actual experience in both home and hospital have proven it to be a necessary and very nourishing food. The cream and milk from which it is made contain g r o w t h - promoting and health-giving substances absolutely necessary to child growth and the health of all ages.

Ice cream soothes and nourishes the sick back to health and strength, because it is so easily digested and so rich in food value. It strengthens and sustains the healthy of all ages, because it contains this element of food so necessary to health and strength. It puts color in the cheeks of youth and laughter in the eye of age. Eat more of it, ye young and old, because it is a real food, an all-the-year-round food.

Healthy and Beautiful, She Knows the Value of Ice Cream as a Food.
(Illustration From National Dairy Council's New Booklet.)

Ice cream is a food which the public has not yet learned to appreciate. They have considered it a luxury and not a real food. This is an error. Ice cream is a nourishing food, very palatable and high in food value.

It is not necessary to load the stomach with heavy, bulky foods in order to furnish proper nourishment for the body.

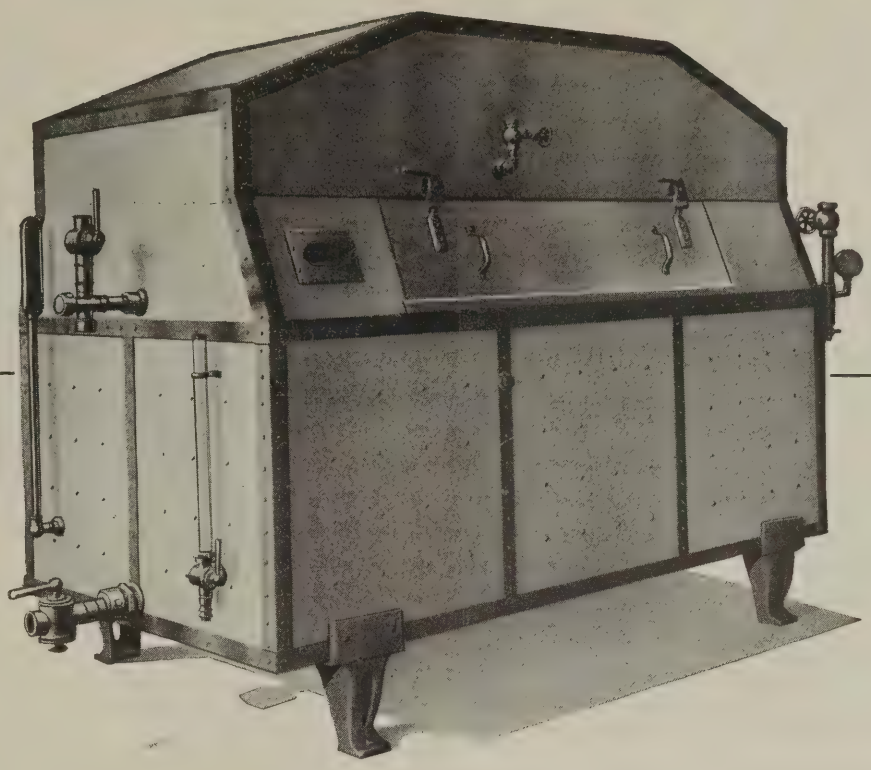
Ice cream is a food which is all digestible. During the war it was declared by the government to be an essential and highly nourishing food.

Food experts tell us that one quart of ice cream furnishes as much nourishment for the body as 14 eggs.

Ice cream should be eaten in every household in America. Let a dish of ice cream take the place of some other food, less desirable, less nutritious and more expensive.

It should be considered as part of the meal.

A dish of ice cream every day will mean health, strength and vitality. Remember, it is an all-the-year-round food.



Until recently ice cream was considered a luxury—now it is known as a real food.

No longer is it a treat for Sundays and hot days, but rather a part of the regular food diet. It is just as much a food for winter as for summer.

All of us love good ice cream. Children just can't seem to get enough of it—and really there is no more healthful food for them to eat. It gives them additional energy and strength, so necessary to their growth and health.

Food and nutrition experts pronounce ice cream one of our very best foods. One quart of ice cream is equal in energy food value to 10¾ lbs. tomatoes, or 4½ lbs. peas, or 14 eggs; 3¾ lbs. chicken or 1 2-5 lbs. of beefsteak.

These facts show that ice cream is highly nourishing and economical. Consider in addition its wonderful deliciousness, and there is every reason why

We invite you to call at our Booth No. 156 and 167

National Dairy Show

Minnesota State Fair Grounds

October 8th to 15th

We will exhibit our latest improved Ruff Milk Condensing Evaporator, Model No. 6, 1922 Special, with capacity

Condensing 2700# raw milk, two to one
2025# raw milk, three to one
1800# raw milk, four to one
per hour

The many new features embodied in this new model, its great economy and being able to produce a better flavored ice cream mix and finished condensed milk at a lower cost is well worthy of your time and consideration.

THE CREAM PRODUCTION COMPANY

PORT HURON *B. Trudell & Company, Montreal, Quebec Manufacturer and Jobber for Canada* **MICHIGAN**

people—both young and old—should use it liberally. The United States government has declared ice cream to be an essential food and placed it in the same group as beefsteak, milk, eggs, butter, and other staple articles of the diet. It is one of the most easily digested foods we have, and on that account is rapidly becoming one of the most important foods in the hospital and sick room. Even the weak and exhausted stomachs of those who are very sick can take this delicate and nutritious food without danger or difficulty, and those recovering from sickness are hastened back to health and strength by its use as a food.

A Real Test of Friendship.
(Illustration From National Dairy Council's New Booklet.)

Ice cream is rich in that essential vitamine which makes the difference between a strong, healthy individual and a weak, worn-out one. Without this vitamine children fail to grow and develop normally, and adults are more healthy and efficient when receiving it in their diet.

From the Council's New Booklet on Ice Cream.

Ice cream makes weak children strong, and strong children stronger. You should give them plenty of this delicious and nutritive food.

Ice cream is made from cream, the richest and best portion of milk. Other ingredients used in the preparation of this delicious food are sugar, eggs, flavoring extracts, and sometimes nuts and fruits.

Throughout the entire process of making ice cream it is never touched by human hands.

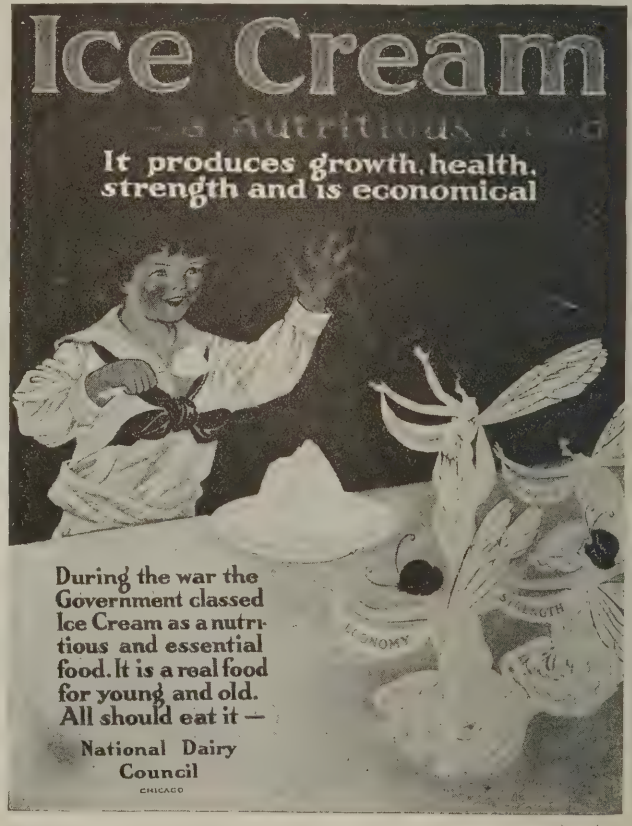
The manufacturer of this product has become so important that it is now taught in colleges and universities throughout the country.

Manufacturers of ice cream know it is to their advantage to produce a product of the highest quality and therefore pay particular attention to the purity and wholesomeness of their ice cream. They recognize the value of factory inspection, so the public may be assured the very best possible product. They believe in co-operation, and give careful study to ice cream problems and how best to serve the public one of the very best foods on the market.

From the Council's New Booklet on Ice Cream.

Ice cream is a food for all ages. It is refreshing, invigorating, and rebuilds the body and mind. Everybody enjoys good ice cream. It is a real health food.

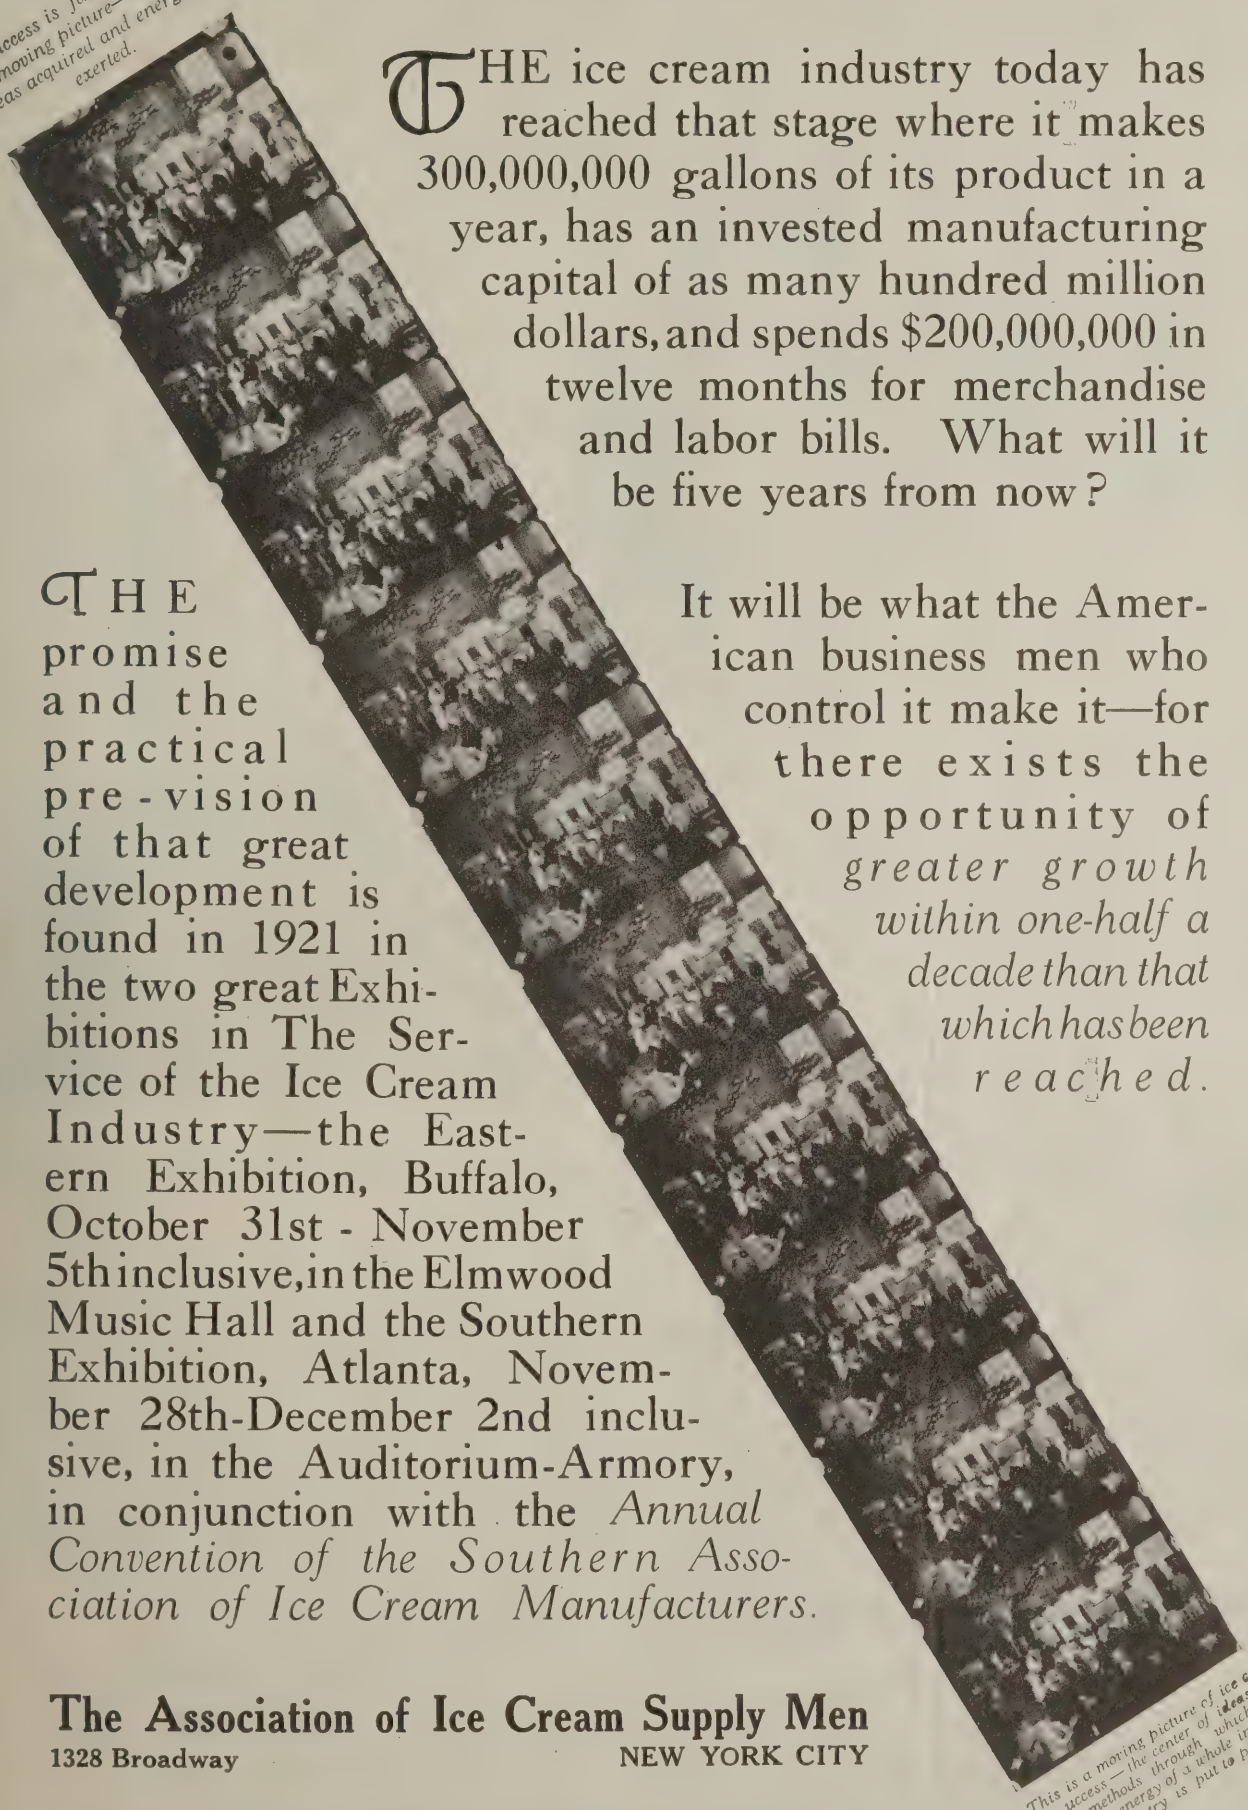
Eat a dish every day and you will be surprised how good you will feel.



As a food, ice cream ranks among the best; as a dessert it is unexcelled.

Ice cream is the one food that combines—in a most unusual manner—rare palatability and high food value.

Ice cream is the children's delight. It tastes good and is good.



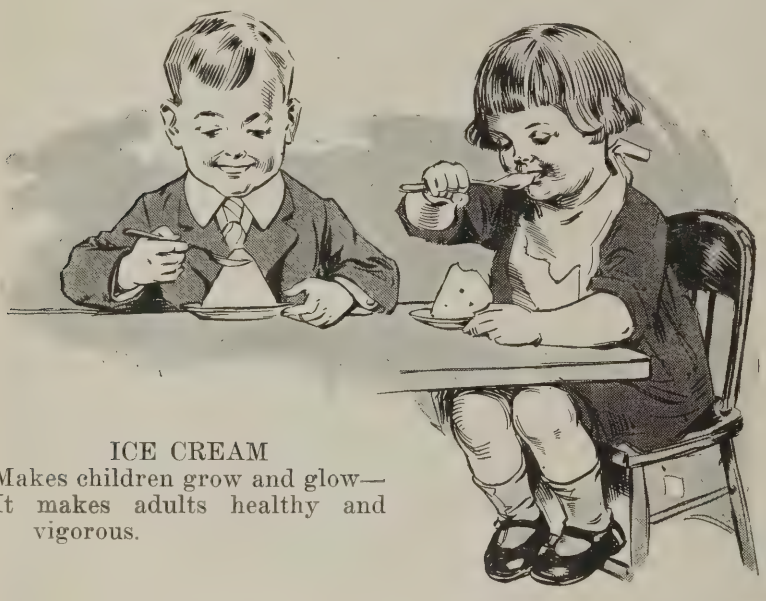
Ice Cream Hanger.

Most attractively done in beautiful colors. Symbolizing the growth, health and strength-giving qualities of ice cream. Emphasizing the fact that ice cream is not a delicacy or a dessert—but a nutritious food, indorsed by the United States government.

The National Dairy Council Beautiful Ice Cream Hanger.

It gets the message across in a big way.

THE ice cream industry today has reached that stage where it makes 300,000,000 gallons of its product in a year, has an invested manufacturing capital of as many hundred million dollars, and spends $200,000,000 in twelve months for merchandise and labor bills. What will it be five years from now?



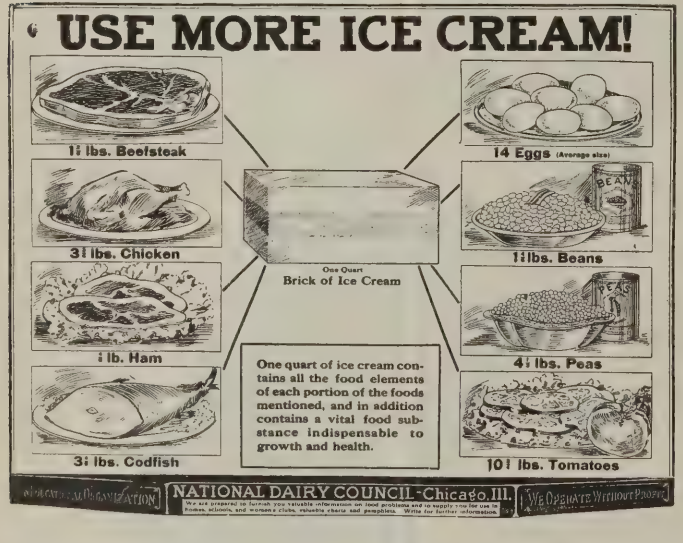
It will be what the American business men who control it make it—for there exists the opportunity of *greater growth within one-half a decade than that which has been reached.*

THE promise and the practical pre-vision of that great development is found in 1921 in the two great Exhibitions in The Service of the Ice Cream Industry—the Eastern Exhibition, Buffalo, October 31st - November 5th inclusive, in the Elmwood Music Hall and the Southern Exhibition, Atlanta, November 28th-December 2nd inclusive, in the Auditorium-Armory, in conjunction with the *Annual Convention of the Southern Association of Ice Cream Manufacturers.*

The Association of Ice Cream Supply Men
1328 Broadway **NEW YORK CITY**

This is a moving picture of ice cream success—the center of ideas and methods through which the energy of a whole industry is put to profit.

Nothing is more appetizing, palatable and delicious and yet no dish is more strengthening and nourishing. It appeals to young and old alike and erroneously has long been looked upon only as a dessert—perhaps there is a reason for this for there is nothing more gratifying to "top off" a meal. The real worth of ice cream has never been considered. It is more than a dessert—it is a real food—not a luxury, and should be used liberally



ICE CREAM
Makes children grow and glow—
It makes adults healthy and vigorous.

This Cut Taken From the National Dairy Council's Recipe Book.

by all members of the family. It is easily and readily digested and furnishes the body with real nourishment at a lower price than beefsteak, eggs, canned peas or tomatoes, or chicken and many other foods.

Ice cream is rich in butterfat, which contains that vital food substance absolutely necessary to the growth of a child and the health of an adult.

Ice cream should not be considered as an after-dish, it is a part of the meal. It will take the place of other foods in the meal, less appetizing and not as economical.

Ice cream is an all year round food. At least a dish every day will mean greater health, strength and vitality because it is a real food.

Through the courtesy of the Chicago Association of Ice Cream Manufacturers the National Dairy Council was given at the recent Pageant of Progress space to put on a display to tell the story of ice cream. The Council selected for its theme the very handsome poster, "Use More Ice Cream," which has been so effectively used by many dealers this last year. The illustration shows the chart poster in miniature.

The poster was then visualized by the use of wax figures of two children and by paper mache for similes of the various foods. Hundreds of thousands of people saw this display and got an almost instantaneous "eye-ful" of the real food value of ice cream. This is a display which can be duplicated in your own town and the Council will gladly be of service to you if you wish to put it on in some display window in your city. Photograph herewith will readily suggest to you the beauty and attractiveness of the display.

A word should be said here about the Council's latest booklet on ice cream. This is an eight-page booklet brief, forceful, beautifully printed in several colors. Just big enough to be read in only a few minutes. In this article have been shown a number of illustrations taken from the book and we have freely quoted also. That you may get a better idea we present on the next page a photograph showing in a measure only the beauty of the cover design for the back. Now imagine this in the natural colors of the foods, the children with the glow of health upon their cheeks and you will see something which very likely you will want

your customers also to see. This booklet is already having a wide distribution. If you haven't seen it, write the National Dairy Council for a sample copy.

⚜

ANNOUNCEMENT.

Mr. Frank X. Sommers, manager of the Mojonnier Bros. Co., Milwaukee plant begs to announce that he has no interest or holding whatsoever in the new firm of Sommers & Sons' Company, foundrymen, and sheet metal workers, 270 Lapham St., Milwaukee.

Mr. Sommers' whole interest is with the Mojonnier Bros. Company and he is very busy tuning out high grade Vacuum Pans that are making a record for themselves and the company all over the country.

Sample Packer will be sent to any Ice Cream Manufacturer or Dealer using Artificial Refrigeration on Application to the Company, it being understood that it will either be returned or paid for within 30 days.

THE GLACIFER COMPANY

102 MERRIMAC ST. BOSTON, MASS.

HOW NORDHEM HELPS THE DEALER.

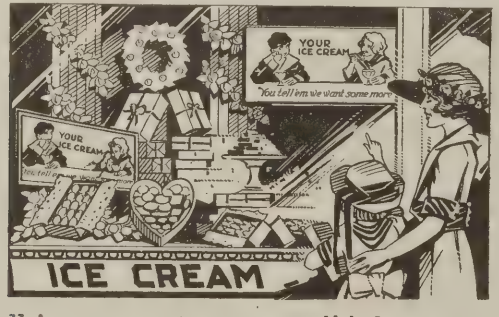
We are indebted to the Ivan B. Nordhem Co., New York City., for the loan of the accompanying cuts illustrating the various suggestions for helping the dealer "call" is irresistible. Window display advertising always commands attention and the suggestion to take home a brick of ice cream can be made in numerous ways in connection with an attractive window display.

The right kind of a window display gets the attention of the passerby whether on foot or in a passing vehicle. An attractive store window display is one of the things which characterize a progressive merchant. The manufacturer who co-operates with his dealer to the extent of furnishing materials and suggestions for a pretty window display earns and receives the appreciation of the dealer. There are many retailers who would like to show progressiveness, but don't know how to go about it to put on a campaign to arouse the comments of the buying public. The wise manufacturer helps them when he can.

"You tell 'em we want some more."

A suggestion for a bill board advertisement which commands instant attention and favorable consideration. Up-to-date ice cream manufacturers are using this modern means of creating a greater demand for ice cream in general and for their brand of ice cream in particular.

The large creameries and milk plants the country over have spent many thousands of dollars in creating a consumer demand for their products. What has been done in those branches of the business can be done and is being done in the ice cream business.



A frame into which varnished full-color posters for dealers' store may be inserted. These are easily changed so that an entire series of beautiful advertising posters may be displayed.

* * *

Two suggestions for a window display which feature the same striking copy as appears on the billboards.

"You tell 'em we want some more" is brought to the attention of the public in so many effective ways that the

The last suggestion in the folder from which we selected these cuts is for the manufacturer to back up his other advertising with liberal space in the local newspaper, an advertising medium of unquestionable value to the manufacturer who seeks to increase local demand.

TO OUR TRADE IN THE NORTHWEST

Gentlemen:

It is a pleasure to announce to our friends and customers in the Northwest the opening of our Twin City branch, 2490-94 University Ave., St. Paul.

Through this branch we will be able to give our patrons in the big Northwest dairy country prompt, efficient delivery service and through our show rooms will make it possible for buyers to personally select their equipment and supplies. We have ample warehouse capacity and will carry substantial stocks.

We wish to express to the dairy people of the Northwest our appreciation of the steadily increasing volume of business which has made this additional service necessary and possible.

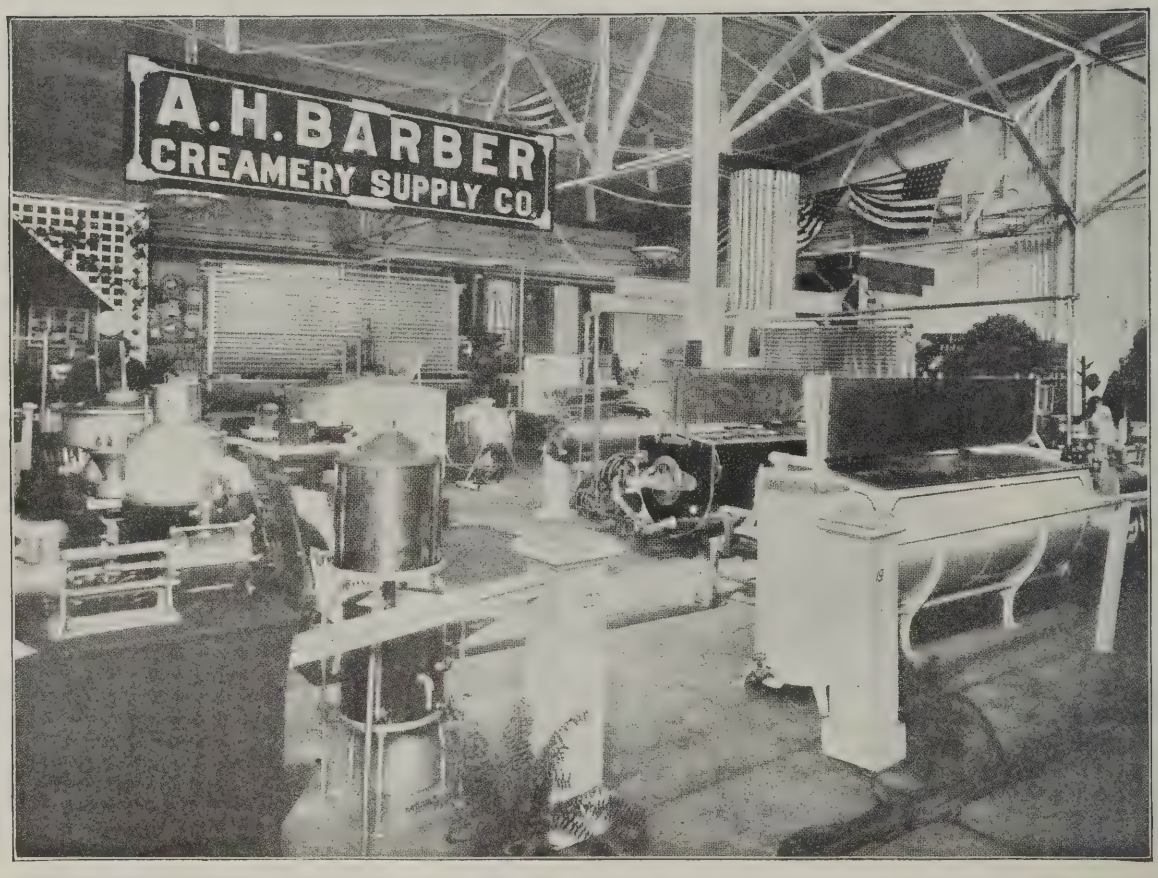
Cordially yours,

A. H. Barber Creamery Supply Company,

AHB/T

A H Barber

President.



TWIN CITY BRANCH—IN THE MIDWAY DISTRICT—ST. PAUL, MINN.
2490-2494 UNIVERSITY AVENUE

THIS map roughly outlines the territory to be served by the Twin City Branch of the A. H. Barber Creamery Supply Company. Orders may be sent either to St. Paul or to Chicago.

Our location is in the Midway district, equi-distant from the centers of Minneapolis and St. Paul, and on the main highway between the cities. Visitors to the Twin Cities are cordially invited to call upon us.

A Truly Representative Exhibit at the National Dairy Show

You can sort out the week's real news by hours of laborious reading of the daily newspapers—or you can get it in 30 minutes from the Literary Digest, boiled down, all of the riff-raff and hodge-podge eliminated.

The Barber Display is the "Literary Digest" of the National Dairy Show exhibits, *because the Barber line embodies the best of the products made by hundreds of manufacturers.*

Not only does it truly reflect the growth of the industry, but it greatly simplifies the selection of dairy equipment and supplies. Out of many years of practical experience, and a knowledge of dairy equipment that no individual buyer could acquire in a lifetime, we have selected *for you* those products which we have found best suited to the needs of our patrons.

We look forward with pleasure to meeting a host of our old friends and making the acquaintance of new ones.

You are cordially invited to use our space in any way you can for the convenience and comfort of yourself and your friends.

A. H. BARBER CREAMERY SUPPLY CO.

CHICAGO ILLINOIS

Twin City Branch in the Midway District—2490 University Ave., St. Paul, Minn.

Kansas Association of Ice Cream Manufacturers

A Review of the "Review" by L. R. Manley, President and B. T. Perkins, Secretary

THE following letter is a message to all members of the Kansas Association of Ice Cream Manufacturers which we received from Mr. L. R. Manley, President of the Association, and B. T. Perkins, Secretary:

To All Members:

We are rapidly coming down the last half of the 1921 season and while it is still warm, cool spells and cool nights will be in evidence in the near future. We will then review the season's business. It is hoping that all will have a fat bank account to divide into dividends or for profits. From the reports given out by different members of the Kansas Jack Rabbits it seems as though the Kansas manufacturers have all been busy and prospering, as we have made it a point to inquire of these said Jack Rabbits about the business welfares of our fellow manufacturers.

The July issue of The Ice Cream Review contains several items of interest, and after looking through this hurriedly, wish to call attention to several different items which interest us. Will say that all other items are of interest, but there are a few which I mention:

On page 28, part of the proceedings of the Iowa State Convention, is the report of the committee on the unfair practice. These are things practiced every day, why cannot the Kansas Association members each adopt these resolutions as their code? There is no use thinking that we are putting something over on the other fellow. While you are doing your unfair practice he is also doing his. Let us all come out of it and be open and fair and show by our hands just what we are doing. Iowa is setting a good example which is worthy of our adoption.

On page 34, Boost the National Dairy Show. Now fellows, read this over, let it have a place in your consideration. Another article on the same page in regard to a new revenue tax bill by Congressman Kellar of Minnesota. Read this over several times and study it and pass your judgment. After reading it the second time, we think it a good bill and worthy of support.

On page 42, (Caught With the Goods). We hardly think any of the Kansas manufacturers would be guilty of an act similar to this, but would have the interest of the dairy industry more at heart, and also the production of a pure, healthful, wholesome ice cream, that is ice cream, as per the meaning of the Kansas law. Let's try and make a better product, which can only be accomplished where we use pure milk integerites.

Following are a few paragraphs furnished by Dairy Commissioner Jones:

Each week I get the United States market report concerning the butter situation. I am quoting to you from this: "'Undergraduates continue very scarce.' 'A great deal of cream has gone into the manufacture of sweet butter which has been taken by the ice cream trade. Much of this cream would have, at other times, appeared on the markets as undergrade salt butter.' I feel it is time to call a halt to this and any information which you can get out to the ice cream manufacturers stating that the law requires pure, sweet, dairy products and that they must discontinue using butter made from poor cream, will be of help. In some cases the flavor of this poor butter shows up in the ice cream. I find that the best ice cream made in the state is made from sweet cream and using additional milk solids or using good butter. The ice cream manufacturers wanted a good ice cream law and I think that we have one. I wanted this law passed and I feel that they should look at it in the right way and not try to make a cheap product and a poor product by using poor butter."

We are sure that all the Review readers appreciate all the letters by Professor Baer. Professor Baer is certainly doing his part in setting a standard for good ice cream. "Our hats are off to you, Professor, and we are with you whenever we can be of assistance."

On page 58. Now you may guess that these fellows received a good Impression of United States Food Diet. But, say, boy, what would they have done if it had been ice cream made in Kansas or Missouri, especially Kansas, which is real ice cream. Professor Baer says that Kansas has the best ice cream law in the Union, and we all recognize him as authority, so therefore, we have to make the best ice cream in the Union for we all comply with the law.

On page 66, (Successful Farming) should visit Kansas and find that our trains are like the Kansas people (not that slow) for we are in the front of the procession and moving too fast to have that kind of a joke even be considered as befitted to Kansas.

On page 70. Now, fellows, here is real reading and food for thought, to be assimilated and digested, then make the decision and all necessary arrangements to

WHERE MASTER MINDS WILL GATHER

Topeka, Kans., Sept. 1, 1921.

The Ice Cream Review:

In Minneapolis, Minn., from Oct. 8th to 15th, will be gathered the master minds of the dairy industry. Men who are experts representing every phase of one of the greatest industries, will be there, an industry that produces, manufactures and distributes a product that contributes to the welfare of practically every man, woman and child in these United States.

It is an honor to be associated with an industry of such vital importance. It is unfortunate that more of us do not realize the importance of the National Dairy Show and the meetings of our different associations.

The Dairy Show places before the men of our industry and the public, an opportunity to gain knowledge of untold value. In view of this, let every person that can possibly do so arrange to attend what we believe will be the greatest and best exhibition of all that is best in connection with the producing and manufacturing of our dairy products.

Let every member of our national and state association see to it that this, our coming Dairy Show and its allied activities, be the best yet. The time of the show coming as it does at the end of the season's rush, offers an opportunity of combining a vacation trip along with the more serious work of the Dairy Show and convention.

L. R. MANLEY, President.
The Kansas Assoc. of Ice Cream Mnfrs.

meet your fellow manufacturers in Minnesota, October 10. The National Association of Ice Cream Manufacturers meets at Hotel Radisson, October 10, 11, 12, then we will have several days to visit the Dairy Show before returning home happy and well pleased with our short visit, as this will surely be one of the very few trips where you can take your wife or your future wife and combine business with pleasure and be happy with both. You will enjoy a few days rest in the cool north after our long prosperous summer. Let's have a large enough attendance to secure a special from Kansas City. If not enough for special train will have special Pullman. The secretary of the National Association writes in part:

Every forward-looking ice cream manufacturer in the country to-day owes it to himself and his business to attend this Convention. He needs the stimulation that the Convention will supply in ample measure; the interchange of ideas, the discussion; the close personal contact with his fellow manufacturers. Bear in mind, too! Every representative ice cream manufacturer owes it to his industry to contribute the results of his experience and intelligent thought towards the solution of many problems that have to be solved in the industry.

Attention! Instructions regarding reduced rate: When you purchase your railroad ticket buy a regular one-way ticket to the convention, and insist on a Convention Certificate. It must be understood that reduced fare is contingent on an attendance of not less than 350 members of the organization, or dependent members of their families, at the meeting holding regular issued certificates from ticket agent at starting point showing payment of normal one-way tariff fare of no less than 67 cents on going trip.

When the required 350 certificates are presented same will be validated by Special Agent and will entitle the holder of a certificate to a return ticket via the same route as going journey at one-half the regular fare."

Come on, now, let's go. Kansas can surely furnish enough to get a special Pullman. It will only require 125 fares to secure a special train, or about 15 to 20 fares to secure a special Pullman. As it is hardly likely anyone will care to go and return by Chicago. Let's hear from you and we will get busy at once.

Your secretary will be glad to gather and give you any information possible.

The meeting place of our next Kansas Convention will be at Kansas City about December 15 and 16. You will be given more definite information later.

The larger per cent, and nearly all of the members have paid their 1921 dues. If you are one having not paid, please do so at once, as our next General Letter will not be sent to those in arrears. No Kansas or Missouri manufacturer can afford not to be a member of the Kansas Association of Ice Cream Manufacturers for the amount of dues, as you will all admit that we are working for a good cause and our Association has made wonderful progress in helping each and everyone in this cause. Let's all do our part to put the Kansas Association at the top of the list, and this can only be done by the united effort of all the manufacturers.

Here's hoping to meet you at Kansas City when we board the Special for the greatest Dairy Show, the greatest Ice Cream Convention, and to show the greatest per cent of attendance of any other State Association.

B. T. PERKINS,
Secretary.

L. R. MANLEY, President.

SAD DEATH OF ARTHUR A. WOODBURY.

The untimely death of Arthur A. Woodbury will leave a gap in the sales force of S. Gumpert & Co., Brooklyn, N. Y., which will be hard to fill. For twenty years he represented this firm.

His body was found floating in a creek near Erie, Pa., August 23rd.

The burial was held from his home, 249 Baton St., Waltham, Mass., Thursday, August 25th.

Mr. Woodbury was a member of the Association of Ice Cream Supply Men, and the following message of condolence in the name of the Association was sent to the widow:

"Mrs. A. A. Woodbury,
249 Baton Street,
Waltham, Mass.

Dear Madam: The Association of Ice Cream Supply Men, composed of business men from many states, to the men of which your husband has been known for many years, expresses to you its deep regret in the loss of your husband and its profound sympathy with you in your realization of the tragic untimeliness of that loss."

THE NORTH CAROLINA ICE CREAM MANUFACTURERS' ASSOCIATION.

After a thorough canvas of the members and directors, it has been almost unanimously decided to hold our annual convention in connection with the convention of the Southern Ice Cream Manufacturers' Association in Atlanta, Ga., from November 28th to December 1st, with headquarters at the Ansley Hotel.

Mr. J. W. Clopton, Secretary of the Southern Association, informs the writer that they expect to put on one of the best conventions ever pulled off in the South, and from all indications it will be well worth the trip.

Every progressive ice cream manufacturer owes it to himself and his business to attend, and the writer hopes our Association will make a good showing with "Present" opposite every name on the list of the members of the North Carolina Ice Cream Manufacturers' Association, from "Buttercup" to "Waverly Ice Cream."

A convention of this kind will not only enable you to get in touch with the most modern ideas and experiments affecting the industry, but there will be a wonderful time for all, not the least of which will be the sights of Atlanta, one of the largest and most progressive cities of the South.

Let's make arrangements to go — **November 28 to December 1.**

"Convention-ally" yours, and more anon,

A. E. DIXON, Secretary.

STILL ANOTHER CLAIMS THE HONOR.

Next time you eat ice cream, consider the debt you owe to Sambo Jackson, negro pastry chef in a New York tavern, who gave the world its first dish of ice cream 105 years ago this month.

For years, Sambo had a monopoly on the manufacture of ice cream, because he kept his process a closely guarded secret. All that is definitely known about his discovery is that it was an accident.

It might not be a bad idea to erect a monument somewhere to Sambo. And, while about it, surround his black marble statue with effigies of the men who gave us artificial ice, lemonade, refrigerators and fans.

More Money In Every Sale

There's more *profit for you* when you sell ice cream out of an ECONOMY CABINET—because it costs you less for icing. Then it costs less in the first place and wears longer than most other cabinets, so it saves you money all the time.

"THE ECONOMY"

Ice Cream Cabinet

is fast taking the place of more expensive styles because it appeals to careful dealers. Made in mahogany and other finishes and coated with waterproof varnish. Insulation is finely graded granulated cork, protected by waterproof felt. Picture shows an Economy Metal Lined Cabinet. Made in from one to four compartments, 12 to 20 quarts. Ask about "Economy" Packing Tubs.

Write or wire for catalog and prices. Prompt shipment if you order at once.

HOMER CITY
P E N N A .

"Helping Mr. Skinner Out"

By GEORGE F. KROHA, Advertising Manager, The Pfaudler Co.

IT IS a noticeable fact that the greatest things in life often receive comparatively the least attention. The ministerial profession, the professor and his kin labor on at nominal pay. Many artists and inventors live only to be exploited by some more shrewd and crafty clansmen—and so it goes.

The dairy industry in a sense, has been one of these. Milkmen in the past have led a rather disjointed existence—plenty of competition and very little co-operation. Even where state associations were formed the effectiveness of the co-operative spirit began to dwindle as soon as the question of taxation for this, that or the other thing was raised. The attitude of the dairyman was that the benefits derived were not worth the fees. He lets go of his money to see it spent by someone else, and doubt immediately rises in his mind. Yet, some of the greatest successes have been founded on co-operation.

For example, as pointed out in an interesting story in "System" for September, J. H. Leighton, of San Francisco, built a successful chain of business, which had for investors, his employees. By carrying the profit-sharing plan farther than was common in the average case, he not only managed to get more work from his employees, but in turn made more money himself. He was able to get as much work from 65 per cent of his workers under the salary-bonus system as he could from the original 100 per cent, working on a straight salary basis, and more than that the work was better done and the relationship established between employees far more cordial. Waste was entirely eliminated because the practicing of economy meant additional profits to the employee. The greatest and most convincing evidence of the success of the entire plan was the fact that six months after it was put into operation the net earnings of the company had increased between 40 and 50 per cent over and above the cost of the bonus. Leighton was willing to take a chance on the other fellow, and in doing so, worked eventually to his own advantage.

I do not mean to say that there is no co-operative spirit in the dairy trade, but rather that the fullest possibilities of this spirit have not been realized. I have often wondered why the Californian, and, in fact, most of the far Westerners, have been so susceptible to co-operation, whereas, the average Easterner seems averse. For further results, just look at the California Fruit Growers' Exchange — Walnut Growers — Raisin Growers — Prune and Apricot Associations, and so on. Their advertising has become familiar to all Americans and a great many foreigners — and that this advertising has paid, can pretty conclusively be estimated by a comparative reference to the annual sales of these industries during the last few years. This is just the type of publicity which our own National Dairy Council is trying to put across.

Furthermore, all the really big successes these days seem to be advertising successes—Coco-Cola, Multigraph, Victrola, Colgate's, Fleischmann's, etc.

How else can you expect to reach millions of people? You certainly can't call on them all.

In your own home town you will note that there is one ice cream manufacturer who dominates all the others, and you are pretty sure to see his name on billboards more often than that of the other fellow. Let him disregard the value of this publicity and he will soon sink back into second place. But this is merely the competitive angle — take the other angle, which is true co-operation; that is, the attempt to get people to eat more ice cream, through general publicity.

The National Dairy Council has issued quite a number of booklets, pamphlets and other literature, giving statistics and figures to show the nutritive value of milk. This is the real selling point.

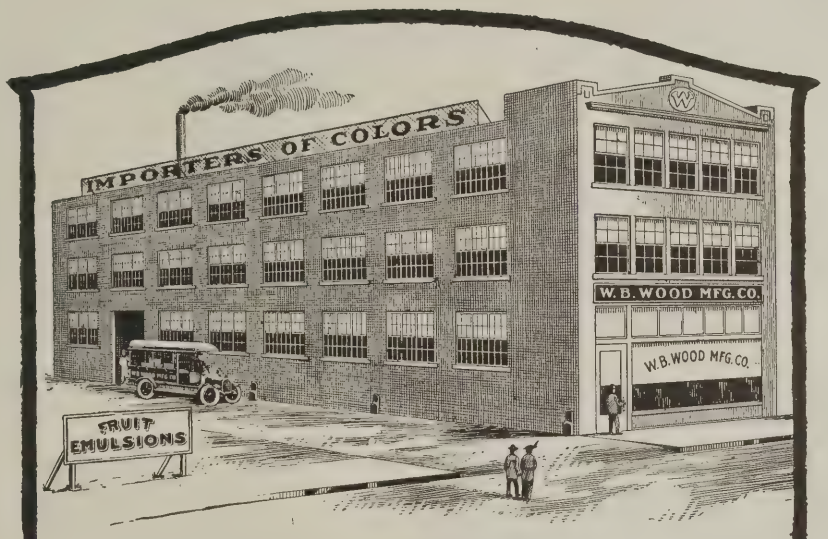
The Fleischmann Company, Northwestern Yeast, Page and Shaw Chocolates, and others, have been giving quite a bit of attention to the subject of "vitamines," pointing out the greater necessity of this food element in our present mode of living. The dairy industry through co-operative national publicity could make just as strong an appeal to grown-ups as well as children on the effectiveness of "taking home a brick of ice cream every day."

There are other selling angles than nutrition, of course. "Purity" (which implies nutrition) is a common one; the variety of brands sold, and the exquisiteness of their preparation, or the service that goes with them, is another. But these are points which invite one to drop into the ice cream parlor or restaurant and taste a bit of ice cream. These appeal to the instinct of enjoyment or luxury. They continue to keep ice cream strictly a confection and do not push to the uttermost its possibilities as a food.

NEW ENGLAND ASSOCIATION OF ICE CREAM MANUFACTURERS.

New Haven, Conn., Sept. 1, 1921.

The Ice Cream Review:



Every ice cream manufacturer who is now a member of the Ice Cream Manufacturers' Association must agree that the benefits he has received from the national association has been a most wonderful factor in helping him to increase his business to the proportions that it now has attained.

I am practically one of the pioneer members of the National Association, and I have never missed a convention, only when difficult business problems confronted me at the convention time, or illness caused me to remain away, and I have never come home from a convention without feeling that the benefits I had received from meeting the wonderful aggregation of enthusiastic and successful ice cream manufacturers did not fill me with enthusiasm and make me fully believe that I was connected with one of the greatest industries in this great United States.

If every ice cream manufacturer in this country would attend our convention and put into operation in their business the many great things that are given to them at these convention meetings, we would certainly make our industry still greater than it is.

I hope that this convention will be the greatest event in the history of the National Ice Cream Association, and I believe it will. I firmly believe that any ice cream manufacturer who does not avail himself of the opportunity of attending the convention is not doing himself or his business justice.

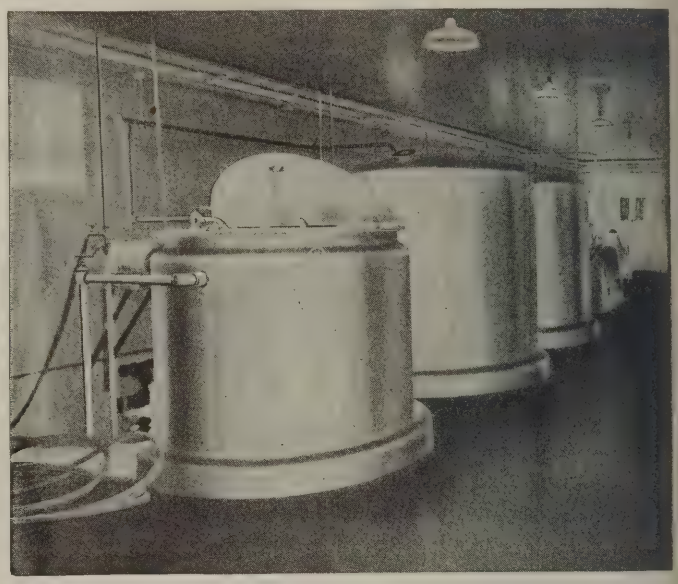
A national campaign to popularize the eating of ice cream cannot be conducted in a hit-or-miss fashion—it must appeal to more than the instinct of luxury in the public. It should show in its advertising by means of facts just as impressive as those used by the yeast companies, the actual food value obtained from the regular eating of ice cream.

Selling these days devolves itself into making new appeals. The dairy industry can make just as good use of the health appeal as have the yeast companies.

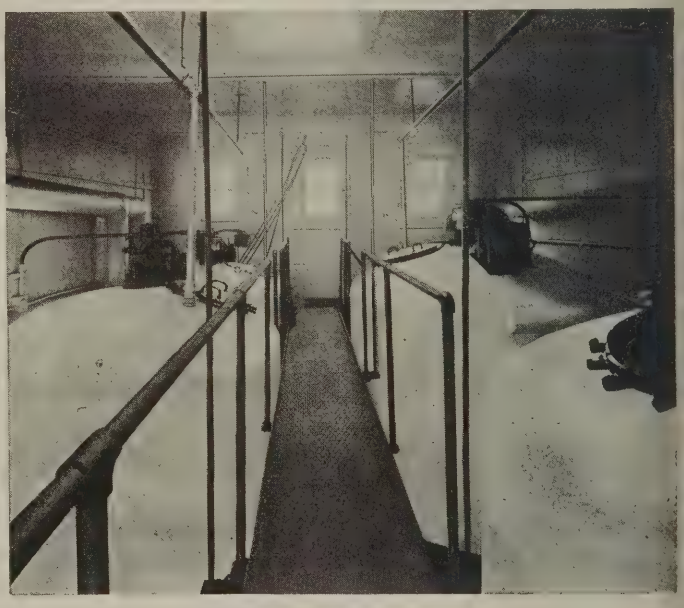
The efforts of Mr. Skinner and his colleagues in their attempt to co-ordinate the dairy industry are certainly remarkable and he certainly has the well-wishes of everyone at the Pfaudler Co.

Time will unquestionably bring about this co-ordination of effort, but why wait for time? Matters can be hurried along considerably by getting behind the proposition and pushing. There seems to be in some quarters too much tendency to place more than the burden of such a campaign onto the supply man.



Partial View of Pfaudler Glass Lined Mixing Tanks at the Plant of the Carroll Ice Cream Co., Chicago.

I am sure that the average supply man is more than doing his share. This is a matter which affects the whole dairy trade, and the success of the project will work as much good to the man who operates one horse and a wagon as to the concern operating a fleet of ten or twenty motor trucks. Therefore, the responsibility is equally his.



The first step which will definitely indicate your active desire to support and promote the collective welfare of the dairy industry will be your Associate Membership in the National Dairy Association. The cost of this is only $5 per year and with it you receive ten general admission tickets to the National Dairy Show. That this worth $5 I think you will agree.

The Pfaudler Co. will be on hand at the Dairy Show this year as usual, exhibiting some of the equipment about which we have been talking in our recent advertising in this paper. The Pfaudler Pasteurizer about which we have spoken so much will be there, and we will have plenty of salesmen to take your orders, or if you are not fully decided, to tell of the merits of pasteurizing in glass-lined equipment. In any case, don't feel that we are going to try coercion

Pfaudler Glass Lined Aging and Standardizing Tanks at the Plant of the Hagemeister Products Co., Green Bay, Wis.

in selling anything to you—you will be welcome at our booth any time, and especially are you privileged to hang your hat on our costumer and test the luxuriousness of our willow furniture.

View of Battery of Pfaudler Glass Lined Storage Tanks at the National Ice Cream Co. Plant, Oakland, Calif.

Let's help Mr. Skinner and the National Dairy Council put over the best show that has yet been undertaken. "Tell your friends and neighbors you are going to the World's Greatest Dairy Show."

VISCOLIZERS TOO!

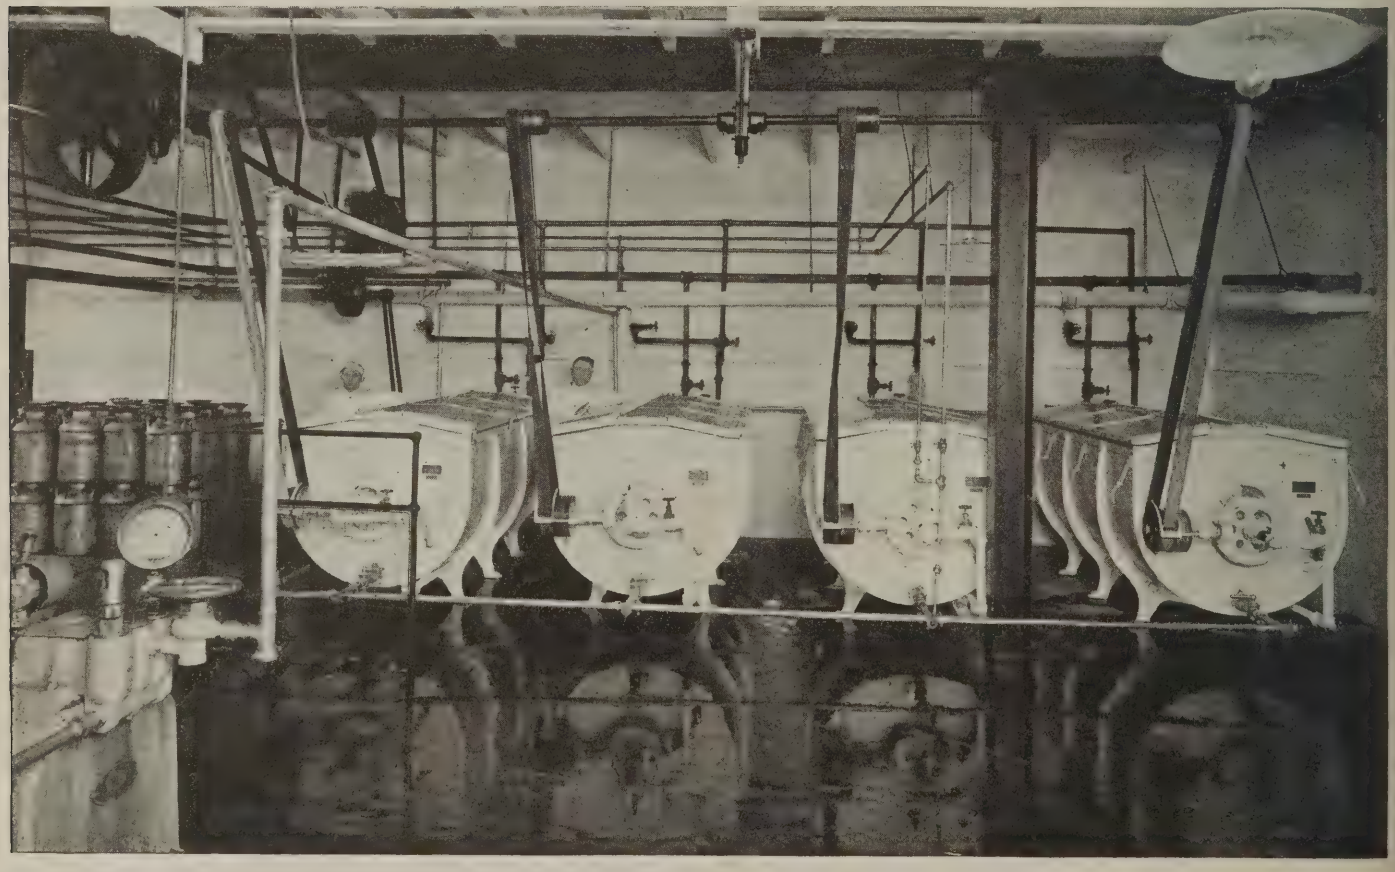
Our Opportunity

By W. R. McEWEN, Advertising Manager, J. G. Cherry Company

We, who are of that multitude which comprises the personnel of the dairy industry in the central and northwest like to think of ourselves as "live wires." But are we? When our chance to be of real service to our chosen profession comes, how do we measure up?

If you and I are not sold through and through on the tremendous importance of the dairy industry, let's get out of it right now. If not, the vast majority of us surely are truly in earnest in our desire to see dairying raised to its proper plane and established as the underlying motive for all farming in our community—NOW is the time to get busy and prove it!

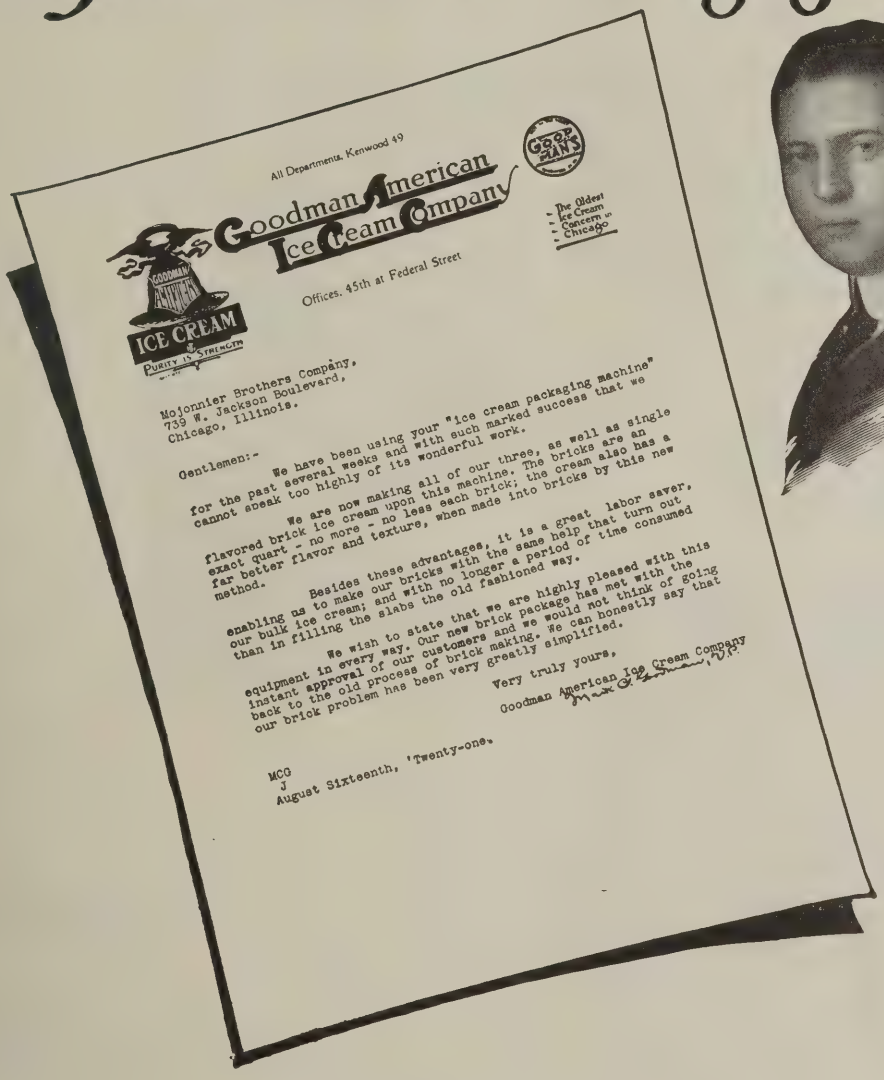
W. R. McEWEN



From October 8th to 15th inclusive the eyes of all the dairy industry will be focused on the State Fair grounds at St. Paul. From every state in the Union and from abroad men will travel by the hundreds and thousands to secure a more intimate knowledge of what constitutes dairying in all its many phases. Everything science has thus far evolved will be on display. Think what that means! The possibilities of the show will be on hand with an educational exhibit that will cost at least $25,000.

Will you and I help reflect the vision our government has caught as regards dairying or shall we sit back with an attitude of indifference, and let folks all about us remain at home, uninformed, when just a little prodding on our part might awaken them to the overwhelming desire to go and see for themselves what is doing rather than to get it second-handed through their friends and the meager reports in the farm papers?

Community conscience — we hear and read so much about it these days. It only means arousing enthusiasm deeper, more honest pride in putting the best foot forward—getting home folks to not only think, but act in unison, inspiring them until nothing short of the best will satisfy.



The ideals of the central and northwest are bound to set a new pace in dairyland. If every one of the thousands of owners and managers of the ice cream plants in this vast territory put their shoulders to the wheel for the next few weeks, and push hard, harder than they have ever pushed before, can you imagine the effect? The attendance at the show will be double that of any previous year and there will be just that many more better boosters for the dairy industry than we had before.

The stage is all set for by far the most comprehensive National Dairy Show this country or the world has ever seen. We who live in the territory that is so close to the center of this great event run the danger of letting its closeness dim our eyes to a realization of the

Mojonnier Brothers Company,
739 W. Jackson Boulevard,
Chicago, Illinois.

Gentlemen:-

We have been using your "ice cream packaging machine" for the past several weeks and with such marked success that we cannot speak too highly of its wonderful work.

We are now making all of our three, as well as single flavored brick ice cream upon this machine. The bricks are an exact quart - no more - no less each brick; the cream also has a far better flavor and texture, when made into bricks by this new method.

Besides these advantages, it is a great labor saver, enabling us to make our bricks with the same help that turn out our bulk ice cream; and with no longer a period of time consumed than in filling the slabs the old fashioned way.

We wish to state that we are highly pleased with this equipment in every way. Our new brick package has met with the instant approval of our customers and we would not think of going back to the old process of brick making. We can honestly say that our brick problem has been very greatly simplified.

Very truly yours,

Goodman American Ice Cream Company

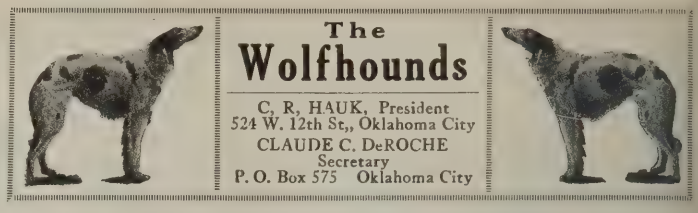
magnitude of the affair. It should be our particular business to rouse every one with whom we come in contact out of their apathy. We are going to awaken our producers to what is about to take place. We are not

Cherry Equipment in the Tiffons Product Co., Long Island City, N. Y.

going to stop at the producers—we are going to tell our communities about the show. We are going to follow out the teachings of psychology by thinking and talking Dairy Show from now until October 8th.



The management not only promises—they guarantee—a magnificent spectacle in every sense of the word.

Cherry Freezers in Arctic Ice and Coal Co., Greensboro, N. C.

Let's show them we appreciate the time and expense they have incurred to boost our business by going ourselves and being directly responsible for the attendance of many, many others.

Are we "live wires?" Do we appreciate what has been done for us? The attendance during the show will decide!

WOLF HOUNDS, READ THIS.

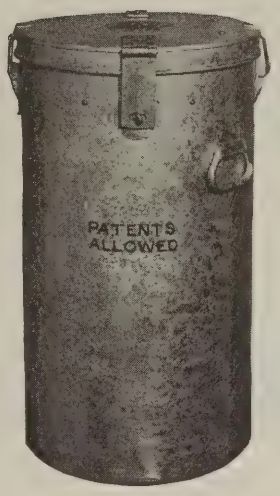
December 12th, 13th and 14th, at Oklahoma City, the most instructive convention ever held by the Oklahoma Association of Ice Cream Manufacturers will take place, also a rip snorting meeting of the (now famous) Wolf Hounds on the same dates. Come prepared for the biggest time of your young lives. Bring your wife and daughters, too, as OUR good Chief of Police, Mr. Glitsch, has promised the writer that the city will be free from Hi-Jackers, and professional gamblers, this is some big promise, boys, but the writer is sure the Chief will keep his word. So come on, boys, African golf can be played here during our big convention, (this should sound good to Jim Nelson, Cutner, Peale, Will Carpenter, Hanks, and the rest of the regulars, also C. R. H.)

C. R. HAUK and SON

I almost forgot the one big item. A couple of weeks ago the writer was called to the phone at midnight, from some place in Texas by a sheriff, who said they had a party locked up in jail for bootlegging, said they had the goods on them, although they could not say positively that it was booze (straight). I, of course, knowing that Hanks was in Texas thought it sure was he, but when they described the party as having rather a RED nose, my thoughts naturally turned to our wet nurse, Pennybacker. Well, imagine my surprise, when the sheriff said the prisoner's name was Kline, that He claimed he was only taking some sample extracts to mix with the mash for Hugh Harrington's cows on his farm up in the Ozarks. (Oh, what a milk shake Kline and Harrington are going to have for the convention in Oklahoma City in December). Anyway they turned the prisoner loose, but kept his samples. Believe me, boys, I slept well after getting over that telephone call. However, as all is well that ends well, here is hoping that all will be healthy and free to attend the Oklahoma convention in December.

Mrs. Hauk and the little Wolf Hounds send regards, with the writer, to all.

C. R. HAUK, President.



KANSAS TO MEET DECEMBER 15 AND 16.

The Kansas Association of Ice Cream Manufacturers will hold their annual convention at Kansas City, Mo., December 15 and 16, 1921. The Kansas boys have commandered the services of the Kansas Jack Rabbits and are going to make this the biggest convention of the convention season. When you are posting up dates in your memorandum book, don't forget Kansas and promise yourself that you will be there.

If you are tired of your business, don't worry over it. Advertise it for sale in The Ice Cream Review Want Department.

Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Iceless Express Container.

What Would it Save for You?

Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover

Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical ways in which they help to develop business.

TIMES BUILDING Room 1001 NEW YORK, N.Y.

Elyria at Minneapolis

By B. L. HARTZ, Dairy Economy Engineer, Elyria Enameled Products Company

ONE more year of active endeavor has swiftly passed since the "World's Largest One-Piece Glass-Enameled Tank" was hauled through the streets of Chicago to come to "parade rest" at the National Dairy Show. Since then it has moved on to accomplish its mission in one of the country's big condensing factories. We are about to celebrate another anniversary of accomplishment as represented by this great exhibit from factory and farm. During the years this company has been represented, it has made many warm friends at the show. We look forward with a great deal of pleasure to seeing them again this year at Minneapolis.

Hayes Ice Cream Co., Minneapolis, Minn., Elyria Equipped.

Elyria Equipment in the Kemps Ice Cream Co., Minneapolis, Minn.

The Elyria Enameled Products Co. is glad to contribute its co-operation and active support to this exhibition, which has done so much toward developing the dairy industry. Here the dairy world is brought up to date each year; here information is available on any subject pertaining to this vast industry, either through pamphlets and literature from representatives of exhibitors or very often, as it happens, from the originators themselves. It is the intermingling of thought and idea, the opportunity for seeing and hearing that makes it all so interesting and valuable to the dairyman, milk plant operator, breeder, farmer, and manufacturer, all of whom are vitally concerned in each other's success. Only through the co-operation of these interests has it been possible to develop a dairy show of national scope and surround it with an atmosphere that has brought to bear such tremendous influence in establishing standards of dairy practice, uniformly throughout the country.

Elyria's contribution will consist of a Standard open 500-gallon pasteurizer and an automobile truck tank of latest design. There are such a number of operating installations in and about Minneapolis that our exhibit will cover not only the show, but practically all of the dairy plants in the city. Besides this, the Elyria product will be shown in the Jensen booth fitted up with the suspended coil and assembled with their well-known mechanical skill. The Toledo Scale Co. will have as one exhibit, an Elyria tank attached to suspension scale, the combination making a very useful and durable weighing unit.

We have arranged through the courtesy of our customers in the city to allow visitors the privilege of inspecting Elyria equipment in operation. This kind consideration has been extended by such firms as the Cloverleaf Creamery Co., the Crown Milk Co., the Crescent Creamery Co., J. H. Hayes & Sons., Ives Ice Cream Co., Kemps Ice Cream Co., Metropolitan Milk Co., Quaker Creamery Co., and in St. Paul, Armour's Oleomargarine plant, which is completely equipped with Elyria units, as well as the Crescent Creamery Co., where several large storage tanks are in service.

The Hayes Ice Cream Co. have a compact layout which has many good features to recommend it. This is a one-floor installation with a peak capacity of 2,000 gallons frozen cream per day. The installation occupies a very modest amount of working floor space, dimensions approximating 10x45 feet. From the mixer and pasteurizer, cream is forced under pressure through the viscolizer, over cooler into storage tanks. Two men in this room can handle all the work of operation in making the mix, freezing and placing

MANNING CAN DRIER

Meet the public demand for a cleaner, better product by drying all your cans. It's the only way to be sure of low bacteria content and prevent rust.

The Manning Drier operates like clock work—dries four cans and four covers at once. Handles any size of milk or ice cream cans.

Write us today for our Can Drier catalog

This Year's Convention will be Greatest Ever Held

By O. S. JORDAN, President, The Association of Ice Cream Supply Men

THE convention of the National Association of Ice Cream Manufacturers this year should be—and will be—the greatest such convention ever held. Great conventions like great industries come only as a reward of hard, constructive work, done well. The ice cream industry today has reached the most widely successful period of its history. It is a peculiarly national industry, as American as Bunker Hill, or the Monroe Doctrine, an industry built on a product of American origin, developed by American persistence, vision and aggressiveness.

To the extent that this great American industry has reached the maximum development the 1921 convention of the national association will represent a maximum in national conventions. To no one can this give greater gratification than to the nationally organized supply men. They have wished the national association well for years and to the limit of their power have worked unceasingly for its development. This year the 100 members of the Supply Men's Association and the 500 members of its Salesmen's Club have helped to spread the word of the convention throughout every state. Our headquarters in New York has done its best to further the enthusiasm that has existed for the meeting. And many an ice cream manufacturer has had the merits of membership in the national association faithfully and earnestly portrayed to him by supply men, in their regular visits. The supply men have been, are today and always will be the staunchest friends of national co-ordination in and for the ice cream industry.

No one today doubts that the same American persistence, vision and aggressiveness that has brought the ice cream industry to its present stage will bring the industry and its national convention of the future to a success that will transcend the present as the present does the past. It is the comforting thought of every man who has the interests of the industry at heart to realize that the hard constructive work that will result in the great convention in Minneapolis this year will not and cannot cease with the dispersing of the delegates there in October. It is the law of progress—and also the nature of the onward-pushing American business men who have made the industry what it is today—that that work will go on increasingly constructive, increasingly broad-visioned and increasingly well done.

And then, as now — in all of the other fifty-one weeks of the year as well as the convention week—the National Association and the industry it represents will find that thorough friendship and support attends them from the Association of Ice Cream Supply Men.

ARKANSAS ICE CREAM MANUFACTURERS' ASSOCIATION.

Stuttgart, Ark., Sept. 1, 1921.

The Ice Cream Review:

It is an old saying that "You can tell what a man knows by the company he keeps." This will hold true when the coming National Convention of Ice Cream Manufacturers and National Dairy Show will be held in the Twin Cities of Minnesota.

Every live ice cream manufacturer will be there, every man that is alive to his opportunity will be found there, every man, young or old, who wants to get out of his rut should be found there and everybody who wants to broaden his vision in order to serve his customers better will be found there.

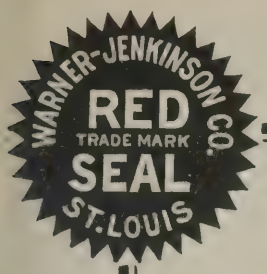
Let us all put our shoulders to the wheel. Let us make this a big convention and a big show by being present. Everybody will know you by the kind of company you keep during the week of October 8th to 15th.

G. A. MEYERS, Secretary,
Arkansas Ice Cream Mnfrs. Assn.

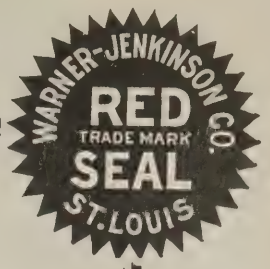
ELYRIA AT MINNEAPOLIS.

(Continued from Page 92)

cream in hardening room, as well as that necessary for keeping equipment clean and sanitary.



The Kemps Ice Cream Co. is one of the large manufacturers in Minneapolis using Elyria tanks for storing and aging of mix. The insert on the right shows three 1,500-gallon tanks installed over the hardening rooms in such manner as to conserve space and obtain maximum capacity from a plant which had originally been designed for a gravity system. Practically the same scheme of operation is still used. The mixing and homogenizing is done on a terrace floor directly back of and above the storage tanks so that cream is pumped into the tanks and from there flows by gravity into freezer.



The Ives Ice Cream Co., another large manufacturer in Minneapolis, is equipped with four 1,500-gallon storage tanks, two 500-gallon mixers and pasteurizers, and a 250-gallon receiving unit. This plant has made use of every available inch of floor space by installing Elyria tanks and has practically doubled its capacity in this department.

For those attending the Dairy Show interested in the city retail milk business and equipment for same, we offer the Metropolitan Milk Co.'s installation which consists of 1000-gallon units arranged in the receiving room as storage tanks to take care of surplus milk during certain periods of operation. These tanks are hooked up with brine for the purpose of cooling so that milk may be held for long intervals at low temperature.

Other installations made in and about Minneapolis and St. Paul are open to your inspection and investigation. We will be glad to show you through.

MEET us at the National Dairy Show, Minnesota State Fair Grounds (Twin Cities) October 8 to 15, 1921

WARNER-JENKINSON CO.

Two Hundred in a Group for Purer, Better Ice Cream

By W. PAUL HEATH of Heathmade Carbonated Products Co., Chicago, Illinois

We are enthusiastic about the National Dairy Show as well as the getting together of the ice cream manufacturers of the United States at the annual convention of the National Association of Ice Cream Manufacturers.

Why, indeed, should we not be enthusiastic about them? Each year there is brought together at the National Dairy Show the best thought and practice pertaining to the world's most important industry. Every year ushers in the multiplicity of progressive and far-reaching ideas that benefits the dairy industry in all its branches. The progressive dairy man wants to get these in order to keep in step with modern progress. Every wide-awake man in the dairy industry seeks these new ideas as persistently as the growing plant seeks the light; and as unerringly as the magnetic needle seeks the pole.

W. PAUL HEATH

The importance of the ice cream industry is best indicated by the fact that this year the American people will spend approximately $700,000,000 for ice cream. Inasmuch as the ice cream industry in the United States is only about a half a century old, ice cream manufacturers are properly proud of this achievement, but they should not be satisfied. Ice cream consumption today is hopelessly inadequate; when we consider that the average consumption per capita is only one dish every six days, we know that this consumption can and will treble.

It will be trebled through effective publicity just as certainly as the slogan—"Have you had your iron today?"—has materially increased the per capita consumption of raisins.

The American people do not know how surprisingly good ice cream is as a food. They do not know how punctiliously careful the ice cream manufacturer is to make it as clean and pure as possible.

Approximately two hundred ice cream and butter manufacturers in the United States and Canada have formed a group pledged to make purer, cleaner and better dairy products by heeding the Department of Agriculture's admonition that air is a disastrous ingredient, and incorporating within the food mass a pure gaseous ingredient instead of a contaminated one.

It was just as certain that the more progressive ice cream and butter manufacturers should form a super-quality group, as it was certain that certain clothing manufacturers should make a higher class of clothes than their fellow-men or that certain shoe manufacturers should seek to make a more satisfactory and higher grade shoe.

An Outdoor Advertisement by Geo. C. Mansfield Co., Milwaukee, Emphasizing the Merits of Carbonated Ice Cream.

Our exhibit will be headquarters for this quality group; a place where they can gather and exchange experiences in their merchandising of cleaner dairy products at a higher price.

* * *

The Heathmade Carbonation Process is now in use by some of the most progressive ice cream manufacturers in the United States. Enormous advertising campaigns, featuring the Heathmade process are being conducted by the Hazelwood Co. of Spokane, The Hydrox Co. of Chicago, and the Boedeker Manufacturing Co. of Dallas. The latter advertises: "There's as much difference between carbonated and ordinary ice cream as there is between a carbonated ice cream soda and one made with plain water."

ASSOCIATION OF ICE CREAM MANUFACTURERS OF PENNSYLVANIA.

Office of the Secretary.

York, Pa., Sept. 1, 1921.

The Ice Cream Review:

We ice cream manufacturers have long ago realized the importance of a National Association of Ice Cream Manufacturers.

Therefore, we should show our appreciation of the efforts of our officers by lending our support not merely by paying our dues promptly, but by attending the conventions.

The knowledge gained by hearing the discussions and the close personal contact with our fellow manufacturers and the many little round table talks during the convention are worth a lot and we owe it to ourselves and our business to be there.

I cannot too strongly urge every ice cream manufacturer to attend the national convention and I particularly appeal to the members of the Pennsylvania Association to be present in Minneapolis October 10th, 11th and 12th.

J. W. NEUMAN,
Secretary.

J. B. ANDREWS, President

FLOAT WITH CP EQUIPMENT WINS FIRST PRIZE.

The merchants and manufacturers in the southwest side of Chicago staged a beautiful parade and carnival in connection with Chicago's wonderful Pageant of Progress. Hundreds of gorgeously decorated floats, representing every conceivable branch of industry participated. It is a matter of pardonable pride with The Creamery Package Mfg. Company that the float of the Peoples' Fuel and Supply Company, which pictured "The Old and New Method of Ice Cream Making," captured first prize, for this float contained a

Ft. Atkinson Horizontal Freezer and a Wizard Pasteurizing Vat properly connected. Of course, the flock of pretty girls engaged in wrapping brick ice cream during the parade, helped to land the honors.

President E. Klinenberg, of the Peoples' Fuel and Supply Company, was complimented by William Hale Thompson, mayor of Chicago, on the unusual and artistic manner in which he pictured a manufacturing industry, and was especially invited to show the truck in other district parades and particularly in the grand parade through the down town district.

Mr. Klinenberg who conceived the idea for the float and personally supervised its decoration, kindly credited the splendid appearance of the CP White Vitrified Enamel Equipment with a share in landing the prize.

HOLLY GROWS REMINISCENT.

Secretary A. P. Holly, of the Indiana Manufacturers of Dairy Products, in his periodical letter to members turns back the pages of history to say:

"A hundred years ago, Indiana was a wilderness. Indians fished the streams and lakes, hunted the forests, smoked the Pipe of Peace in their wigwams and held unchallenged sway. But gradually pioneers came from the direction of the rising sun and trouble started.

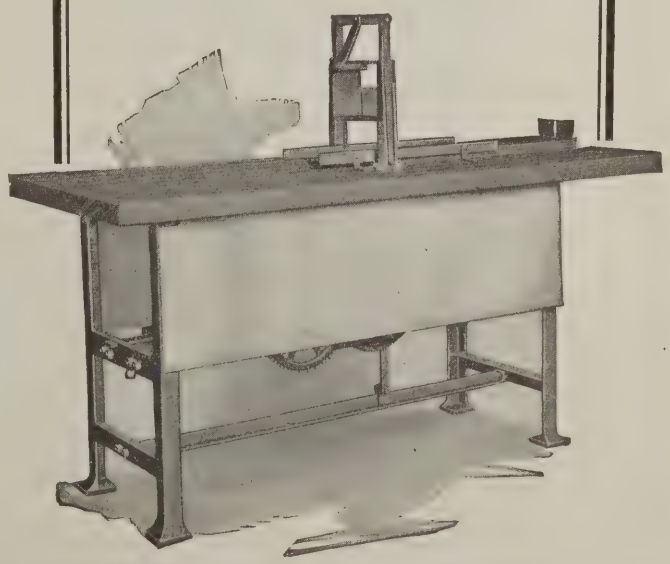
The Journal of the Black Creek School Master records the following incident on his trip towards the Wabash Valley:

'About noon we reached Cicero Creek and encamped for dinner at an unextinguished camp fire, where some persons had stayed the previous night. They had killed a deer, dressed and cooked what they needed of it, and with a commendable regard for the comfort of their fellow travellers through the wilderness, they had salted and baked one side of the ribs of the deer previous to leaving, and turned the other side to the fire to be properly cooked for the next emigrants who might chance to pass that way. We were the lucky travellers who found it, done brown.'

Some of the early settlers were a rough-and-tumble lot, but they knew how to MAKE PROGRESS in their business of advancing civilization. Business in Indiana in 1824 was not much different, after all, from business in Indiana to-day."

Speed Up
Your Brick Cutting Dept. with a "New Era"

Cuts standard ice cream slabs from moulds into quarts, pints or any size desired, as fast as the operator can release the ice cream from the moulds.



Absolutely Uniform

and unfailingly accurate is the "New Era" Ice Cream Brick Cutter. It's simplicity, speed and accuracy.

Controlling Combustion on Basis of CO^2 Alone Unsatisfactory

Falls Far Short of Attaining the Best Possible Results. By F. C. HARGER

FURNACE efficiency should be considered separately from boiler efficiency, and the master key to the proper testing of furnace efficiency is continuous gas analysis, which not only measures the excess air present at all times, but **also promptly detects and measures the presence of combustible gases in the flue whenever they appear.**

What Savings are Possible.

When coal is burned in a boiler furnace under ordinary conditions, an average of about 65 per cent of the heat generated is used to make steam, 25 per cent goes up the chimney, and the balance is lost through radiation and in the ashes. How important it is to hold the chimney losses down to a minimum be-

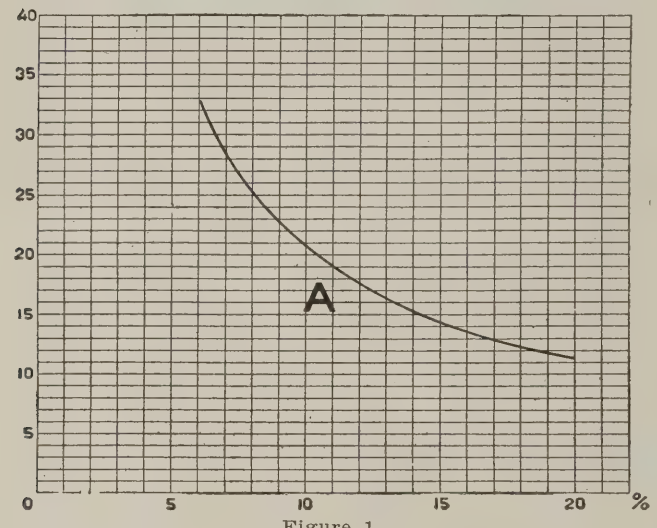

Figure 1.

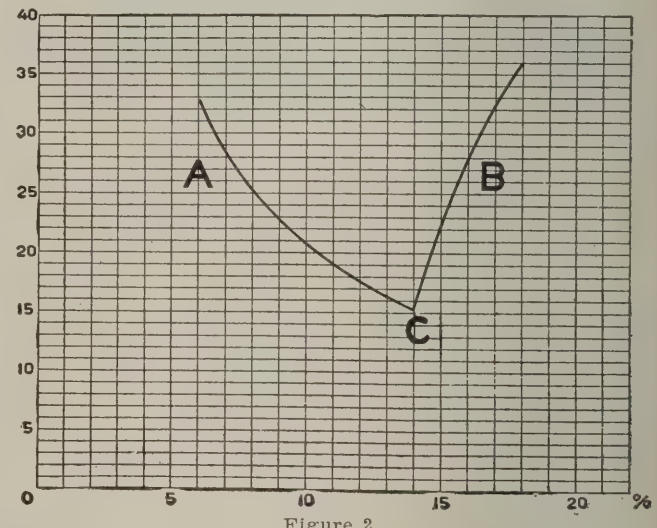
comes evident when we consider that every decrease in chimney losses results in a proportionate saving of heat available for steam making.

To produce steam representing 1000 units of energy it is necessary, on the 65 per cent efficiency basis above described, to consume approximately 1,538 units of energy as it comes in the fuel. Now, suppose the chimney losses are reduced from 25 per cent to 15 per cent, which is not unusual, and that the 10 per cent thus saved are turned into useful energy, making this 75 per cent of that supplied in the fuel. Then, to produce 1000 units of useful energy requires only 1333 units of energy as supplied in the fuel. The difference between 1,538 and 1,333 is 205, and this is nearly 15½ per cent of 1,333, the fuel actually required to carry the load under the more economical conditions. In other words, the saving in fuel represents 15½ per cent of what is necessary under the more efficient operating conditions.

Kinds of Chimney Losses and Their Relative Importance.

Heat is lost up the chimney in two distinct forms, namely, the sensible heat of the entire volume of flue gasses, and the heat represented by the chemical energy in unconsumed combustible gases. The amount of the sensible heat is a function of the temperature



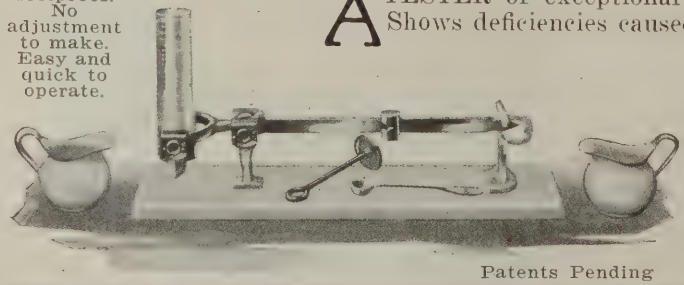


Figure 2.

and the volume of the flue gases. The amount of heat lost in the form of chemical energy is a function of the heat of combustion of the unconsumed combustible gases and their volume. The loss of heat represented by a certain percentage of unburned combustible gases in the chimney is much greater than the loss of heat due to excess air represented by an equivalent percentage of CO^2.

To completely burn fuel, a surplus of air is always necessary over what would be theoretically correct. The amount of this surplus varies constantly, depending upon the many different factors that influence com-

bustion. However, maximum efficiency under practical conditions is attained when there is just enough surplus air to make complete combustion possible, that is, combustion without the escape of combustible gases up the stack. It is that point where a reduction in the air supply results in incomplete combustion, and an increase in the air supply results in an unnecessary waste of energy through the carrying away of sensible heat by excess volumes of flue gases.

An idea of the magnitude of the fuel losses due to the escape up the stack of combustible gases when the air supply is unsufficient as compared to the losses due to the presence of excess air may be gained by a comparison of the curves in Figs. 1 and 2. In Fig. 1 we have a curve showing the fuel losses which take place with varying percentages of CO_2 (varying inversely with the excess air supply) in the flue gases, **providing** there are no combustible gasses present. However, combustible gases (CO, CH_4 and H_2) are bound to begin to form at some point as the percentage of CO_2 is increased (air supply decreased) and, as mentioned before, losses due to the formation of these combustible gases are far greater in proportion to their volume than losses indicated by equivalent proportions of CO_2. This is graphically illustrated in Fig. 2, where the portion CB in the curve represents fuel heat losses that develop beyond the point C where combustible gases begin to form as the percentage of CO_2 is still further increased by reducing the air supply.

The point C is **the critical point.** It is the point where combustion takes place with the greatest economy in fuel consumption. It varies not only in different furnaces, but varies constantly in the same furnace.

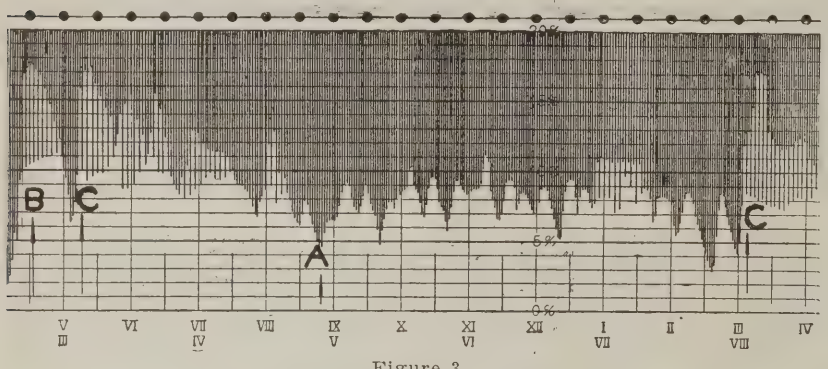

Figure 3.

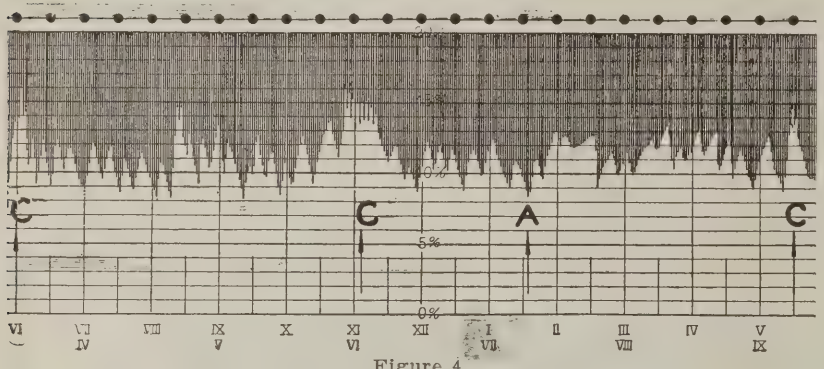

Figure 4.

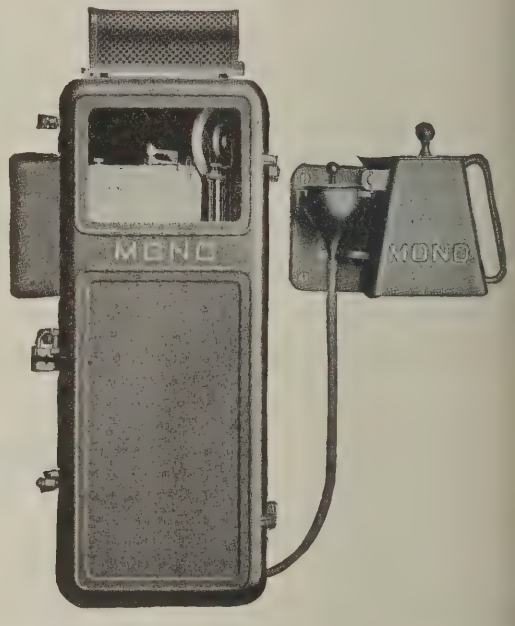

Figure 5.

The curves shown were plotted from generally accepted average values. On that basis, the following comparisons are interesting. Let us assume that when CO_2 is 14 per cent, combustion is taking place under conditions of maximum efficiency in the furnace. The unavoidable loss under these conditions is 15.3 per cent of the total fuel used. Let us assume that only 1 per cent of combustible gases forms for every per cent increase in CO_2 beyond this point. Taking into account the heating value of these combustible gases, calculations show that when the percentage of CO_2 reaches

"DOC" Solves the Fly Problem

Dear Doc:

The flies have been an awful pest this year, and if you know any remedy that will drive them out of my plant and keep them out, I'll be your booster for life. What would you suggest?

Chas. Paddock.

Dear Mr. Paddock:

I suppose you have screens up. If not, that comes first. Then make a solution of Germ-X, two ounces of Germ-X to one gallon of water, and spray your ceilings, walls and floor about twice a week. Remove any refuse piles from near your plant. Then you'll discover that most of the flies will hunt up some other victim.

Don't forget either that spoiled products will be prevented if you run a Germ-X solution through your entire system after each cleaning. Run it through as if it were so much milk or cream, and run it cold.

Yours for Sanitation,
DR. GERM-X.

Tell your Friends and Neighbors you are going to the World's Greatest Dairy Show, Minnesota Fair Grounds, October 8th to 15th.

15, the fuel loss is 22 per cent, and when the percentage of CO_2 has reached 16, the percentage of fuel loss becomes 28.

What CO_2, CO, CH_4 and H_2 in the Flue Gases Tell About Combustion.

Many power plant engineers consider it foolish to place much confidence in CO_2 readings, and make it a general rule never to allow the CO_2 present to exceed 10 to 12 per cent. Others put it as low as 8 to 10 per cent. Under these conditions, there is likely to be a great waste of fuel due to the avoidable escape of sensible heat up the chimney. In contrast with these there are authorities who claim there is no danger of having combustible gases escape unconsumed before CO_2 reaches a point above 15 per cent.

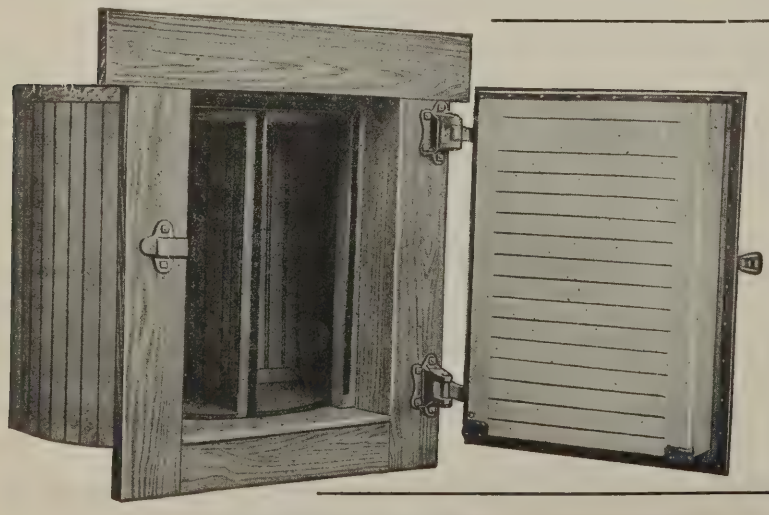
The fact of the matter is, combustible gases may appear with any percentage of CO_2, and depending on CO_2 records alone is therefore decidedly misleading and illusory. It is quite possible to have large volumes of combustible gases, (CO, CH_4 and H_2) present simultaneously with a low percentage of CO_2 as well as a high percentage of CO_2. For example, if the fire in one part of the furnace is very thick or dirty, CO would be generated in that part and escape unburned because not enough air would be going through. If, at the same time, there is an air hole in another part, air would rush through there unused. Under these conditions CO would be found present at the same time that the record would indicate excess air by a low CO_2 reading.

The percentage of CO_2 for economical combustion may vary considerably from time to time in the same furnace with the rate of combustion, method of firing, thickness of the fire bed, distribution and character of the fuel, draft, formation of ashes, dirt and clinkers, and many other influences which are subject to irregular variations, and which have a decided effect upon the completeness and efficiency of combustion with any given air supply.

Generally speaking, low CO_2 indicates excess air, but may also indicate that the air is poorly mixed, giving rise to a simultaneous formation of CO. It is therefore not desirable to attempt to secure a high percentage of CO_2 by cutting down the draft alone. A high percentage of CO_2 can be obtained with practically any draft, so long as it has the proper relation to the fuel bed resistance.

On the other hand, the losses due to the formation of combustible gases which are allowed to escape up the chimney without being burned are frequently much greater than the losses due to excess volumes of air, because it is quite possible to reach a very high percentage of CO_2 while simultaneously producing large volumes of combustible gases (CO, CH_4 and H_2).

Insufficient air supply is the most general cause of the presence of CO in the stack. CO may, however, be present due to the poor design of the furnaces, improper methods of firing, the coal being of a character not adapted to the equipment with which it is burned, poor mixing of the combustible gases with the air and low furnace temperature, which causes gases to be cooled below the ignition point before combustion is complete.



Occasional snap tests for CO with hand instruments to check up the CO_2 recorder have therefore proven entirely deficient in properly controlling combustion. Recording CO_2 alone has never, under any condition, given results even approaching the possibilities of economical combustion, and it is positively known that the maximum economy in fuel consumption cannot be realized by any of the old fashioned methods.

Facts About Combustion in a Furnace not Generally Recognized.

The oxygen used in the process of combustion in a furnace comes from two sources, namely, the primary and the secondary air supply. The primary air supply is that which flows through the combustible material in the fire bed. The secondary air supply is that which is admitted to the combustion chamber above the fire through holes in the fire bed, the fire doors, through leaks in the boiler settings, etc. It supplies the free oxygen necessary to oxidize the combustible gases generated in the fire bed.

The Bureau of Mines has conducted exhaustive experiments to determine what actually happens when coal is burned in a furnace. It was discovered with one fuel, that when the fuel bed is over 4 inches thick, and free from air holes, a furnace without secondary air acts very much like a gas producer. In a fuel bed 12 inches thick, where no secondary air was supplied, practically all the oxygen was consumed 4½ inches from the bottom of the fire. At this point CO_2 reached 14 per cent and combustible gases registered 10 per cent. About 26 per cent of the gases leaving the top of the fire were combustible gases, while the percentage of CO_2 was reduced to 7. Le Chatelier states that CO_2 generally reaches a maximum at a height in the fuel bed ten times the diameter of the coal pieces. From this point on reduction of CO_2 takes place.

The combustion of coal in an ordinary boiler fur-

THE ASSOCIATION OF ICE CREAM SUPPLY MEN — MEMBER

Time has Proved the Purity, Quality, Uniformity of our product

nace thus takes place in two stages. In the first stage, the fuel bed acts as a gas producer, producing CO and other combustible gases in large volumes. In the second stage these combustible gases are mixed with the secondary air and the carbon in the CO and other combustible gases is oxidized to CO^2, and the hydrogen combines with oxygen to form water vapor.

Contrary to the generally prevailing impression, the volume of the secondary air required to burn coal in a furnace is greater than the volume of the primary air. If the coal were all carbon, the volume of the secondary air required under ideal conditions would be the same as the volume of the primary air. In the first stage of combustion the reaction would be $2C + O^2 = 2\ CO$. In the second stage it would be $2\ CO + O^2 = 2\ CO^2$. In other words, the volume of air required to convert the carbon into CO in the primary stage is the same as the volume of air required to burn the CO into CO^2 in the secondary stage. However, there are other gases than CO which come off in the first stage of burning coal. To burn these additional gases, secondary air is required. Inefficient mixing of the combustible gases in the combustion chamber with the secondary air supply gives rise to still further demands for excess secondary air, that complete combustion may take place. How much secondary air is required depends on the furnace design, kind of stoker, method of firing, kind of fuel, etc.

Nobody can tell anything about the volume of the secondary air, where it all comes from, how much enters through the various known channels, or what its proportion to the total air supply is. It is generally recognized, however, that the one safe rule is to keep it at the least possible minimum necessary to insure complete combustion of combustible gases. This can only be done by a constant watch for the appearance of combustible gases in the flue, while holding the percentage of CO^2 at the maximum point which can be maintained without the appearance of such combustible gases.

Holes, ashes clinkers, or dirt in the fire, thickness of the fuel bed, draft, length of time of opening of fire doors and regulation of dampers,—all cause wide and irregular fluctuations in the amount of secondary air admitted. While the amount of this secondary air has such a decided and important effect on the economical combustion of the combustible gases which are formed in the fire bed, it is a most bewildering and hopeless task for the fireman to attempt to control it scientifically, or to form any conclusions, or to make estimates based on direct observation regarding the proportion or amounts of this secondary air entering at any time. To achieve efficient furnace results, same clear, simple means should therefore be provided for telling him just how much excess air is present at all times, and to give him prompt warning of the appearance of combustible gases in the chimney. Such means act as a guide for the fireman, enabling him to intelligently regulate his fires and to manipulate to the best advantage the controllable elements which determine the admission of excess air to the combustion chamber.

The best method of firing a particular furnace, and regulating the air draft and dampers, can only be determined by trying various ways and means and carefully watching the results recorded from the analysis and recording of both CO^2 and combustible gases. Only through such a procedure can the fireman learn by experience what must be done, and what must be avoided to give the maximum percentage of CO^2 at all times without the loss of combustible gases up the flue. Without such a continuous and complete record of both CO^2 and combustible gases, or with a record of CO^2 only, he is working blindly in the dark, and can tell nothing about the results of his various efforts towards attaining higher combustion efficiency.

Correct mixing of the air and the volatile combustible products of the furnace is a matter of greatest importance, and represents one of the most difficult problems of design the combustion engineer has to contend with in his efforts to cut down the amount of excess air necessary to insure complete combustion and to reduce the possibilities of having unconsumed combustible gases escape up the chimney. Stratification, having the process of mixing take place too slowly, or premature cooling of the mixture below the ignition point—all lead to waste.

How nearly combustion in practice can reach the ideal is well represented in certain boiler plants where blast furnace gas is the fuel. By means of a multiplicity of interspersed small air and gas orifices such a thorough, intimate mixture of the fuel and air is obtained that the percentage of excess air necessary to insure complete combustion has been practically reduced to zero. On the other hand, it is not at all uncommon to find in small coal burning boiler plants where hand firing is used, that the CO^2 in the flue gas analysis registers as low as 4 per cent, showing the presence of 420 per cent excess air.

In a paper by Ambrose N. Diehl on "Modern Methods of Burning Blast Furnace Gas Under Stoves and Boilers", the following statement appears: "In view of the fact that 1 per cent of CO in flue gas containing 18 per cent of CO^2, adds approximately 6.5 per cent to

the losses, and a proportionate larger amount in more dilute gases, it becomes apparent that a high degree of accuracy in the CO determination is very desirable. For this reason, efficiencies based on analyses of a CO_2 recorder are not dependable." He states further that constant gas analysis and intelligent supervision are the principal factors in obtaining continuous good efficiency and control without changes in equipment. Similar statements hold good where coal is the fuel.

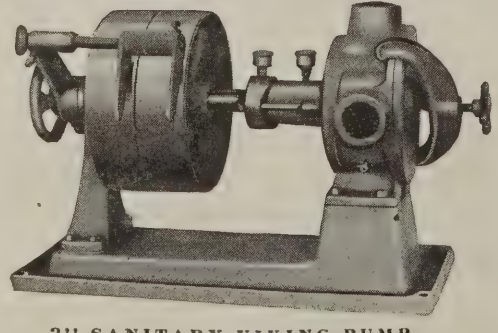
Essentials in the Attainment of Maximum Economy in Combustion Control.

Only by continuously recording the percentage of CO_2 as an indicator of the amount of excess air present, and also detecting and clearly recording the presence of combustible gases (CO, CH_4 and H_2) immediately they are present, can effective combustion control be established. By no other means is it possible to avoid unnecessary loss at all times in the combustion of fuel, either due to an excess supply of air or through the loss of combustible gases up the chimney.

Graphic records of such a combination of simultaneous gas analyses, considered in conjunction with other records and the various functions in boiler room operation, not only point the way toward improving combustion in a given furnace, but are also an indispensible guide when, to improve combustion, alterations or reconstruction of a furnace are considered. At such times, the grate, combustion space, baffles, arches, wing walls, dampers, settings, chimney or mechanical draft, etc., all come under consideration.

Recently an instrument has been perfected and placed on the market, which not only accurately analyzes and records the percentages of CO_2 present at all times in flue gases, but also promptly detects and clearly records on one and the same chart the presence and the approximate proportion of combustible gases whenever they appear.

Mr. Olof Rodhe, chief engineer of the Mono Corporations, states that his experience with a great many plants, both in America and Europe, has conclusively proven that "economical combustion is possible only when combustion control is based on records indicating not only excess air, but also the presence of combustible gases due to an insufficient supply of air. Combustion control on the basis of CO_2 alone, with an occasional snap reading of CO is not effective. Only by simultaneously and continuously analyzing and recording the percentages of both CO_2 and combustible gases present in the flue at all times can the maximum economies be attained in fuel consumption." These requirements have been successfully met by the new Duplex Mono Gas Analyzing Instrument of which Mr. Rodhe is the inventor.



One of the prime purposes of the Duplex Mono is to detect the presence of combustible gases in the flue immediately upon their appearance, and to record accurately the percentage of CO_2 present **at that particular time.** It is so sensitive and accurate in the performance of this function, that it will unfailingly detect and record with the least possible delay the presence of even such minute fractions as one-tenth of one per cent of combustible gases in the products of combustion. Even this slight proportion is clearly recorded on the chart, so its presence is easily detectible by the operator at a glance. The presence of combustible gases once established, the accurate determination of their actual percentages is not of any importance. The instrument indicates approximately the degree in which they appear, and that is sufficient for the guidance of the fireman. The actual percentage present is rarely less than two-thirds, or more than equal to the amount recorded on the chart.

Even where the old conditions were considered as most favorable, the installation of these instruments has repeatedly demonstrated that incomplete combustion was prevalent to a far more serious degree in modern boiler plants before the new method of control was adopted, than was ever suspected.

Fig. 3 represents a diagram made by one of these new double-recording instruments. The lower contour of the diagram accurately represents the percentages of CO_2 present at all times. The lighter areas in the diagram indicate the presence of combustible gases (CO, CH_4 and H_2). The proportion of combustible gases present is roughly indicated by the height of the lighter areas at any particular time.

Looking closer at this diagram, it will be seen that at the point C fartherest to the left, combustible gases began to form when the percent of CO_2 was 10, and the amount of combustible gases formed increased rapidly, as the percentage of CO_2 increased to 11 per cent, only to vanish again when the percent of CO_2 was again reduced to 10 per cent. At point C to the right, combustible gases begin to form again, this time, however, when CO_2 is only 8½ per cent. This shows that between 4:30 in the morning and 3 o'clock in the afternoon, changes have taken place in the furnace conditions such that while combustible gases began to form when CO_2 was 10 per cent early in the morning they began to form when CO_2 was only 8½ per cent in the afternoon. Should the operator keep CO_2 at 10 per cent all day long. It is evident that serious losses

might take place as in this case between 3 and 4 o'clock in the afternoon, as indicated in the right hand part of the diagram. That is what happens when the maximum allowable CO^2 is determined for an indefinite period by a snap CO test.

Diagram 3, which we have just discussed, shows the condition found in a boiler plant at the time the instrument was first connected, and the furnace was operated on the old principle. Certain changes were made in the furnace, the nature of the fuel and the method of firing, with the result that conditions as illustrated in diagram 4 were obtained. In this diagram it is seen that CO^2 could be carried to a point as high as 13 per cent without the formation of CO. In other words, the critical point was raised several points higher on the diagram, the reduction in air supply without formation of combustible gases resulting in a saving of 20 per cent in fuel. With such a record always before him, the operator is always in a position to follow closely any variations in the positions of the critical point and knows immediately when combustible gases begin to escape unburned up the chimney. Where the dark contour goes below the critical point, too much air is supplied, or there is improper distribution of air. Where, on the other hand, the dark contour rises above the critical point, that is, the point where light areas begin to show, the supply of air is insufficient.

General Characteristics of the New Combustion Control Instrument.

The apparatus (see Fig. 5) is driven by water pressure of about 10 pounds per square inch. Before entering the instrument, the gas samples from the flue are pulled through a filtering system, which removes all traces of soot and dirt. They are then drawn into and forced through the apparatus by a mercury piston. There are no mechanical valves, such functions as these ordinarily fulfill being performed by various kinds of mercury seals, traps, etc.

Samples of gas are forced alternately through two routes; one leading directly through a caustic potash tank where CO^2 is absorbed, and the other first through an electrically heated furnace wherein the combustible gases are oxidized to CO^2 and H^2O, and then through the caustic potash tank. Samples that are forced through the caustic potash tank give the readings for CO^2. Those that are first forced through the electrically heated furnace and then through the caustic potash tank, give readings of CO^2 plus combustible gases. The difference between any two successive readings is proportional to the amount of the combustible gases present at the time the analyses are made.

In the electrically heated furnace, the oxygen necessary to oxidize the combustible gases, CO, CH^4 and H^2 to form CO^2 (which is later absorbed in the caustic potash tank) and water (which is condensed) is usually taken from the air which is almost invariably present in flue gases, even when combustible gases are present. When such free oxygen is not available, oxygen is taken from copper oxide provided in the furnace for that purpose. The copper oxide, however, probably seldom acts as anything but a catalytic agent and need never be renewed.

Should any of the copper oxide be reduced to plain copper to oxidize combustible gases in the process of anaysis, it is reoxidized by oxygen present in the flue gas samples passing through the electric furnace later.

To diminish the lag between the time when the gas leaves the flue and the analysis is recorded on the chart, small communicating tubes are used. The lag between the time that the sample is taken from the flue to the time that it is recorded by the instrument is about 3 minutes where the distance between the instrument and the point where the flue is tapped is about 60 feet and the instrument is making about 40 analysis per hour.

These instruments are made to produce records covering a range of either 20, 25 or 40 per cent, according to the purpose for which they are intended. The 20 per cent range is the most common. A range shifter can be provided so that the position of the range is adjustable, that is, the 20 per cent range, for example, can be set between 0 and 20, 5 and 25 per cent, 10 and 30 per cent, or between any other limits at the will of the operator.

The recording pen, when at its highest position, comes into contact with an ink container having a two weeks supply of ink. The ink in the pen is automatically replenished every time it returns to the high point on the chart.

The apparatus is practically dustproof and requires only a slight amount of attention, which consists in winding the clock once a week, replacing the caustic potash solution two or three times a month, replenishing the ink supply twice a month, and putting in new rolls of paper once every two months.

Accuracy of Records and Their Value.

The readings indicating the presence of combustible gases are exaggerated, if anything, by the Duplex Mono. This is quite an advantage in a danger signal. The losses due to the appearance of combustible gases

are much greater than the savings due to an equivalent increase in CO^2 as registered on the chart, and an exaggerated record of their presence on the chart has a favorable effect on the fireman. Since it is aimed never to have combustible gases present at any time anyhow, there would be no object in having exact records of the percentage present where they do appear. An approximate, and preferably an exaggerated record, is all that is necessary, and this is the kind of record made by this instrument.

Why the records of percentage of combustible gases are not exact, is explained in the following paragraphs. The discussion of these phenomona is, however, of little practical importance, since the object of prime importance is to detect and record combustible gases as soon as they are found and to know exactly what the percentage of CO^2 is at that time. While the degree in which combustible gases are present need be known only approximately, the percentage of CO^2, on the other hand, should be accurately known at all times and particularly at the time combustible gases begin to appear, so the fireman may always know how high he may carry this percentage of CO^2 under the best conditions without running into the danger of generating combustible gases, and how near he is to this point when combustible gases appear at other times, so he may handle his furnace accordingly.

Where CO, CH^4 and H^2 are oxidized through the addition of oxygen taken from the copper oxide in the electric furnace, the volume of the flue gases is not affected by their passage through the apparatus other than by the removal of these gases. The re-actions are as follows:

$$2CO + 2CuO = Cu^2 + 2CO^2$$
$$2H^2 + 2CuO = 2H^2O + Cu^2$$
$$CH^4 + 4CuO = CO^2 + 2H^2O + 2Cu^2$$

After leaving the electric furnace, the H^2O is condensed, and the CO^2 is absorbed in the caustic potash solution. The records of combustible made by the instrument under these conditions are therefore in exact conformity with the proportions of these gases removed. A large excess of copper oxide is always carried in the furnace, so that the apparatus can run a long time analyzing great quantities of combustible gases continuously without running short of exygen, should no free oxygen be available in the flue gases for extended periods.

When, in the process of oxidizing CO, the oxygen is supplied by air present in the flue gas sample, the chemical re-action is as follows:

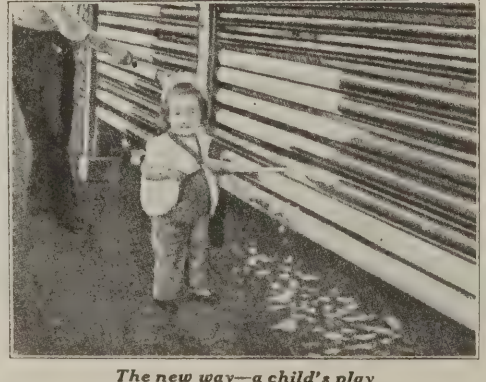
$$2CO + O^2 = 2CO^2$$

Two volumes of carbon monoxide combine with one volume of oxygen to form two volumes of carbon dioxide, which is later absorbed in the caustic potash solution. Since three volumes of gas are thus removed to record two volumes of CO, the actual volume of CO present is, under these conditions, only two-thirds of what the record shows.

When CH^4 is oxidized with free oxygen from the air present in the flue gases, the re-action is as follows:

$$CH^4 + 2O^2 = CO^2 + 2H^2O$$

One volume of CH^4 plus two volumes of oxygen produces water, which is condensed, and one volume of CO^2 which is later absorbed in the caustic potash tank. In other words, three volumes of gas are removed from the sample for each volume of CH^4. Under these conditions, the percentage of CH^4 present is just one-third of that recorded by the instrument.



When hydrogen is oxidized through the addition of oxygen in the air, the following chemical reaction takes place:

$$2H^2 + O^2 = 2H^2O$$

The water is condensed and removed in liquid form. Three volumes of gas (2 of hydrogen and 1 of oxygen) are thus removed for every two volumes of hydrogen present. Consequently, the amount of hydrogen actually present is under these conditions but two-thirds of what the instrument indicates.

Sufficient free oxygen is almost invariably present in the flue gases to oxidize the combustible gases there without resort to the oxygen supplied by the copper oxide. Even in the rare instances where this is not the case, many years of experience and innumerable tests in plants of every description under all kinds of conditions have conclusively demonstrated that the readings of the instrument are never affected by the removal of free oxygen from the gas samples to re-oxidize Cu to CuO for more than one or two analyses after the combustible gas has disappeared from the products of combustion, and the increase in the length of the lighter areas which record combustible gases on the chart resulting from the absorption of oxygen from the flue gases is therefore negligible. The copper probably has more of a catalytic action, and incidentally forms a reserve supply of oxygen to draw on in emergency only.

What is of prime importance is the **immediate detection** and **recording** of combustible gases the instant they appear, and an accurate record of the CO^2 present at that particular time, and at all other times as well.

The new way—a child's play

The slight lag which might appear at rare intervals in recording the time when combustible gases cease to appear does not matter.

The CO_2 records of the machine are invariably accurate. This makes possible the accurate determination of the critical point at any time under any conditions. The critical point, C, as mentioned before, is the highest percentage of CO_2 that can be reached in a given furnace without having combustible gases begin to appear. The higher it can be raised, the more economical is the process of combustion. Knowing its maximum from the clear and accurate records of the instrument, the fireman can always tell the degree to which he is approaching ideal conditions. Should combustible gases appear at a point below the critical point, he knows that his dampers, fire doors, or the fire itself needs immediate attention, which experience soon teaches him to give to the best advantage.

The plant executive is given a permanent record which gives him the data necessary to compute the degree of efficiency attained in the firing of the furnaces, and offers him every opportunity to intelligently appreciate the efforts of the firemen. It enables him to give valuable suggestions and advice and to cooperate with the boiler room force most effectively towards promoting fuel economy.

HOME PROCESS FOR MAKING SODIUM HYPOCHLORITE.

On another page appears an advertisement by the Electro Chemical Company calling attention to their process of producing sodium hypochlorite for disinfecting purposes. It is claimed that by the use of electrolytic cells it is possible to produce the product at a very low cost. Where electricity can be obtained for two cents per kilowatt and salt at ¾-cent per pound electrolytic hypochlorite of soda can be produced for about one cent per gallon. This should prove of interest to large users whose plants are supplied with electric current.

MEET us at the National Dairy Show, Minnesota State Fair Grounds (Twin Cities) October 8 to 15, 1921

A BRIEF HISTORY OF THE ICE CREAM INDUSTRY.

It is stated that Alexander the Great was very fond of iced beverages. At the courts of France and Italy in early times, wines and fruit juices were cooled with ice and served. It is reported that Marco Polo brought recipes for water, ice and milk ice from Japan in the thirteenth century. Charles the First of England was served with ice at a banquet, the ice being made by a French cook, named de Mireo, and the King was so pleased with the dish that he pensioned the cook with twenty pounds a year on the condition that he would not make ice for anyone else. As time went on, others among our forefathers began the freezing of wines and fruit juices and then of milk and cream.

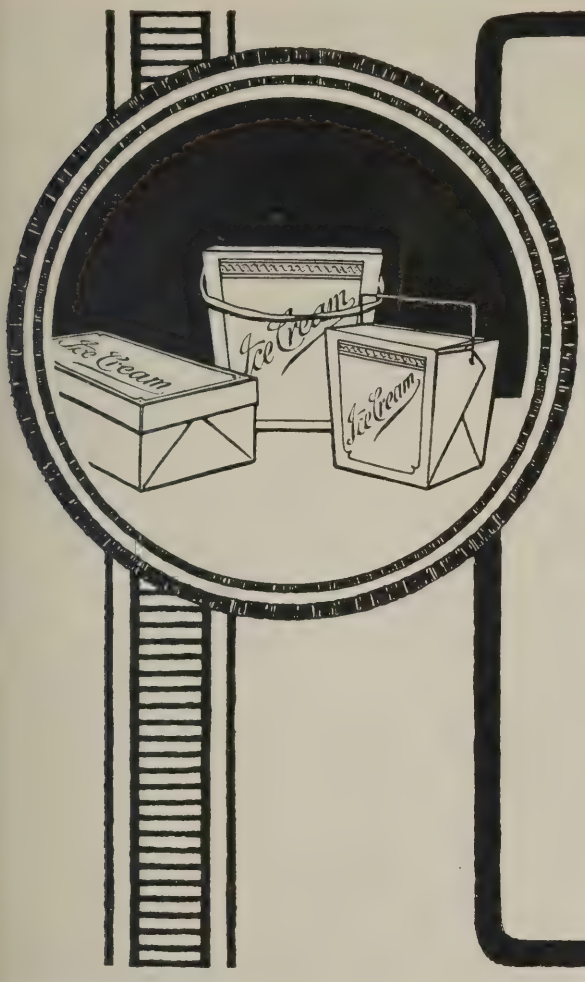
Ice cream is said to have been first introduced in the city of Washington by Mrs. Alexander Hamilton at a dinner attended by George Washington. The first ice cream advertisement on record is one that appeared in the "Post Boy" of New York City, January 8, 1786, at which time ice cream sold readily at one dollar per quart.

So far as known, Jacob Fussell, a milk dealer in Baltimore, Md., was the first man to enter into the wholesale ice cream business. He took it up early in the nineteenth century, in order to utilize his surplus cream.

In about the year 1890, the ice cream business commenced to make rapid strides and it has grown continuously since that time, until today over two hundred million gallons of ice cream are consumed annually.

Ice cream as a food is being recognized more and more for its nutritious value. Food is any substance taken into and used in the body for the purpose of building new tissues and repairing the old and for supplying the body with heat and energy. The best foods are those which produce the best physiological results with the least amount of waste. They must be hygienic, digestible, palatable, furnish the nutrients (proteids, carbohydrates, fats and minerals) necessary for the developments of the human body are present in such proportions as to render ice cream most serviceable as a food. These food constituents are present in ice cream in such form as to make them easily digestible.—Viroqua, Wis. Senator.

BANKER TURNS ICE CREAM MAKER.



Many ice cream makers no doubt hope to be able to become bankers some day, but here is a banker who would rather be an ice cream maker. Mr. Charlton Karns, Knoxville, Tenn., has been interested in a local bank, also in the Racy Ice Cream Co., of Knoxville. Reports are to the effect that Mr. Karns has disposed of his banking interests and will devote his whole time and attention to the ice cream business.

Proceedings of the Sixth Annual Convention, Milwaukee, Wis.

(Concluded from August issue)

A few years ago we knew of no measure upon which we might count to indicate the physical well-being of a child, but the studies of scientists have lately shown us that a child's weight in relation to his height, in the first place, and then to his age, is a very definite indication of his physical development. With a scale and a measuring rod it has, therefore, been possible to valuate, as it were, the health product of the homes and schools of the country. The result of these tests has shown us how widespread is the menace of under-nourishment among our children and the necessity of grappling with the problem with every means at our command.

The term "nutrition" has been largely associated in our minds with food, but we have now learned to speak of nutrition as indicating the whole physical welfare of the child. Formerly we were satisfied to apologize for the skinny or puny child by putting the burden for his condition on his ancestors, declaring that little John "takes after his Grandfather Williams, who was always thin," or by explaining that "Mary is just like her Aunt Jane, who never could put on any weight." This is certainly not a fair deal, either for the child or the ancestors, because no one can tell definitely whether a child is intended by nature or Providence to take after thin Grandfather Jones or fat Grandmother Smith. Thinness is not due to heredity, not to predestination nor to a decree of Providence, not to original sin, but to causes quite within the control of the parents and their medical advisers. The problem is distinctly up to the parents. They must find out, in the first place, whether or not there are physical defects which may be hampering the child's development; secondly, whether he is being properly fed with energy and growth building foods; and, finally, whether his home and school program are such as to promote health, as well as develop the child mentally. Do not imagine, as so many people do, that I am speaking only of the under-nourishment of city children. By actual count there is more malnutrition among children living in the rural sections than in our large cities, though to convince our country neighbors of this is one of the hardest things we have to do, when these facts are urged. The reply is always made that of course such children are all right because they live in the country where there is plenty of milk, cream and butter. Yes, but who gets these rich gifts? Not the children always. This reminds me of a story I heard recently. The women of a rural community were starting hot school lunches for the children in a little country school. Different mothers took turns furnishing the milk or cocoa and the one hot dish. One noon there was no milk for the children to drink and one little child brought a note from her mother—the wife of the most prosperous farmer in the county—which said "We need it all for our calves."

Some one has said that if a farmer were raising his children to be sold by the pound, he would feed them as scientifically as he does his cattle, and would keep for his children some of the vegetables and milk which are sent to city markets to help nourish the children there. Do you think the average farmer would be satisfied to dismiss from his mind the condition of any of the animals on his farm with the explanation that the "little pig is thin because he is growing so fast," or "the calf is not putting on weight because it takes after its father?"

Dr. William R. P. Emerson, of Boston, has given us the reasons for malnourishment as the result of his twelve years' work in Boston. The program he recommends to bring these children up to normal health and vitality is about as follows:

1. A complete physical examination by a competent physician, in the presence of the parents.
2. The remedy of physical defects found, i. e., diseased tonsils or adenoids removed; teeth treated; eye strain relieved, etc.
3. The usual three meals a day, eaten very slowly, consisting of milk, butter, bread, cereals, vegetables, fruits, some sweets, and little meat; no tea, coffee or Coco-Cola.
4. Two extra lunches at 10:30 and 3:30 of milk and crackers or bread and butter. Never give sweets between meals, as they impair the appetite.
5. A rest period of one hour in the morning, and another of half an hour in the afternoon—lying flat; ten hours' sleep at night, all with windows wide open.
6. School hours shortened, or given up entirely if need be until health is gained; outside classes and clubs omitted.
7. No vigorous exercise until weight is normal but plenty of play time out of doors.
8. No nervous excitement—few parties, "movies", picnics, until the habit of weight gaining is established.
9. Children should have at least one regular bowel movement a day, preferably just after breakfast, and should be taught great respect for all their body functions.

This program has been adopted, so far as possible, in the health work done by the Elizabeth McCormick Memorial Fund, and the results of the work in Chicago have been most gratifying.

The Elizabeth McCormick Memorial Fund feels convinced that the school is the logical place for these classes, since health is the fundamental of all education, though up to the present time it has been almost an unknown quantity in the school curriculum. It has also been shown clearly that the success of the nutrition class depends not only on the personality and teaching ability of the nutrition worker, but on the successful co-operation of the homes and schools for the benefits are faulty and should not be tolerated in an enlightened, civilized nation like our own. The child holds all the promise of the future in his hands, and it is only if we teach him to build well that we shall have a sound nation to carry forward the traditions and ideals which the builders of our Republic have passed on as a sacred inheritance to us.

In conclusion let me say—do not be afraid to urge the promotion of a health program in connection with the marketing of your product. It will bring results! Above all things, however, see that the product each one of you furnishes is absolutely pure and one which you can with a clear conscience recommend for children. People who adulterate dairy products in any way seem to me particularly vicious as betraying the confidence of the public in a food which is absolutely essential to the life of the human race. It is a part of your responsibility as dealing with one form of this indispensable product, to see that you guarantee its purity to the mothers and children who have confidence in what you have to sell, and who should not be be-

trayed. Perhaps you think we cannot mix business with sentiment, but I myself believe that part of the business success of America is due to the vision and ideals behind it, and to the fact that some of the leaders in commercial life have not been afraid to consider human welfare as good business."

* * *

SOME EXPERIENCES AT SECTIONAL MEETINGS.

By Mr. F. W. Holmes, Manteno, Illinois.

Mr. Chairman, and Gentlemen of the Wisconsin Convention: I hardly think it necessary for me to say very much in regard to my experiences at these meetings. I presume everything is all right in Wisconsin, but two years ago it was not so in Illinois. Someone has wisely said, "If you have a good thought, use it," and in the fall of 1913 I was conferring with the manager of one of our plants in Kankakee, and he thought that the cost of raw materials was coming so close to the selling price that it was narrowing down to almost nothing, as far as margin was concerned, and we felt something must be done, but what could we do as an individual concern? Then I thought of this saying, "If you have a good thought, do let it go." The great inventor, Edison, has spent a great deal of time on some of his inventions. The phonograph took him eight years. If we have a good thought we want to use it, send it up. In the ice cream business this work is largely a work of self-preservation as far as the manufacturers are concerned, but at the same time there are others. The great Salvation Army Booth wished to cable a message over to his workers from London and he didn't know what to say that would express his meaning. Finally he simmered it down to the one word, "Others." So I say in our work we want to be mindful of the other fellow.

In 1913, after thinking that matter over, what could we do? There was nothing individual we could do, but we must have co-operation. I conferred by letter with two of the other manufacturers down state in Illinois and I asked them if they would be willing to be one of three to send out a letter to the various manufacturers calling a meeting to see if we could do something about this situation. Immediately I got replies back, "We are with you." We gathered together near the city of Bloomington, the first sectional meeting that has ever been held in Illinois. I think it has been said of me I originated the sectional meeting. If that is the fact I am very glad it was my privilege to do that.

In coming together at that meeting in September, 1913, we had the manufacturers from Central Illinois and they were apparently all afraid of each other. The man that sat next to the other fellow didn't say much, he was afraid he might get next to his price or mix or some of his buying products. There was that feeling we must keep apart, but the chairmanship was wished on me unexpectedly and I saw there was just one thing to do and that was to have a good old fashioned Methodist meeting. Mr. Stewart got up and told us his competitors were there, and likewise we got them on their feet, and I want to tell you it did them good. They got up and told the conditions they had in their city. From Peoria and Quincy, everybody was testifying as to what the conditions were in their city, and they would like to see them better. We had an attorney present at that time so we didn't violate the Sherman Act, and there was no combine in that meeting. I am glad to say in less than fifteen days after that we were getting a little better price for our ice cream down there in Central Illinois.

I was elected president of the Illinois Association and Mr. Loewenstein and I made out, with the assistance of some of the other manufacturers, cost bulletins. If you haven't a cost bulletin and can see where you can find out what it is costing for delivery and for sugar and your raw products, get it, and if it isn't possible for you to get it yourself, get some auditing company to work it out for you, and I will say this for you, as well as for myself that you can't have anything in your factory more necessary. Mr. Loewenstein and myself went as a pair of twins down through the central part of Illinois drumming the industry just like Mr. Loewenstein, Mr. John Knobbe and Mr. Cunningham have done locally. It was a little hard to get men to these meetings, but when they saw what was in it they began to come and down through Central Illinois it has been a wonderful help. We held the meetings in Peoria; we talked matters over then and there and it helped the industry.

I remember one meeting we had in Central Illinois, Centralia, we had a meeting there a few days ago. I was not there myself, but Mr. Loewenstein tells me they had a splendid good meeting. At that meeting we had one manufacturer that had been pointed out to us in that city, he wasn't going to come to that meeting, and Mr. John Newman, who was then Health Commissioner of the State of Illinois. Mr. Loewenstein and myself went to see him, but he wouldn't come. He knew how he wanted to run his business. During the following summer they had an epidemic in southern Illinois. They began cutting the prices, and they began robbing the quality. Some of the manufacturers profited by that meeting, but many of them

WISCONSIN ASSOCIATION OF ICE CREAM MANUFACTURERS.

Madison, Wis., Sept. 1, 1921.

The Ice Cream Review:

Every ice cream manufacturer, creameryman and everyone interested in the dairy industry, should attend the National Dairy Show at Minneapolis in October as it will be of great educational value to all. I believe that the members of the Wisconsin Association of Ice Cream Manufacturers cannot afford to miss the convention of the National Association of Ice Cream Manufacturers, which will be held at the same time.

They have come to realize that their state and national conventions are the places where they can meet and exchange views and get the latest ideas from the most progressive people in their line. Personally I feel that every manufacturer will be well repaid by attending.

F. E. CAUGHEY, Secretary.
Wis. Assoc. of Ice Cream Mnfrs.

did not. During that summer Mr. Newman put some of his inspectors down there and Dr. Kline, who was State Analyst, aided them and they went all over Southern Illinois and got samples of what those fellows were making. The butterfat and sanitation was way below what it should be, and some of those fellows got calls to square themselves on the carpet. Some of them began to get very nervous and they came to Chicago, but in the meantime one very hot day in August that I speak of, we went out to see this man who wouldn't come to the meetings. We wired Mr. Loewenstein to be there, to be there Sunday afternoon to hold a meeting. He went down there, and our Secretary spoke to them very emphatically, and I want to say to you, Southern Illinois has given the ice cream men throughout that part of the state better co-operation than ever before. We are keeping up these meetings

I have in mind four competitors that bordered on the west of us. We are largely in Eastern Illinois, Champaign is one of our cities, Kankakee and two other minor points, but we are over against the Indiana line. I want to say to you in the years gone by nobody could make as cheap ice cream as Indiana could, but they finally learned of some of our co-operation and they began to invite some of our workers to go over there and see if we could assist. One of your speakers here yesterday afternoon I think spoke of the splendid condition they have over there. Mr. Harvey is the secretary over the milk, butter and ice cream departments, and they have three heads now. It was my privilege to go over with Mr. Loewenstein when they instituted that. Their condition over there is very much better than what it used to be, and they have been selling their product very close to Illinois.

What I have to say is largely with down state and up state conditions, not of the large cities. We are fortunate in Illinois, especially the central part, that the large manufacturers in Chicago do not ship very much ice cream. It is largely left to the down state people.

I also recall a meeting in northern Illinois. It seemed rather hard to get a meeting up there. There was a condition there that especially affected about five manufacturers and we had been trying very hard. There seemed to be one or two manufacturers that were established in a certain idea and we couldn't prevail upon them to change. Finally I said, we will adjourn this meeting, but before we adjourn it I am going to make a last appeal to those five men, if they will take their places around the table and settle this matter themselves. I asked the principal manufacturers if they would do that and they all said they would. They sat down to the table and while we were putting on our coats these men got through and they said they had adjusted the matter. We have to be tactful; we have to be careful how we go at these men. I recall an instance at a certain point. We had some splendid customers there during the war, and they were large consumers of ice cream, and at that time I think we were getting somewhere about 90 cents, the early part of the war. One of our very best customers said, "I am buying my ice cream for less money." It was being shipped from nearly a hundred miles away, over in Indiana. We let the matter rest. We knew who the shipper was. They had never solicited the business, but some traveling man had been around there Four years ago, I think it was, I was in the city of Columbus, Ohio, and I says, "I am shipping some ice cream over near you." And he said, "I don't know how it happened we got the customer, but we didn't solicit him." I said, "You got him not so much on the service, because you only have one train a day, we have six or seven, and as far as quality is concerned I think we are making equally as good a product as yourself," and he didn't deny that. "As far as value is concerned I believe our value is equally as good as yours, but price! Some way we get the idea we are educated to price rather than value that goes along with the service." I said, "Of course it is up to you. You have cut the price in order to get that business or the dealer would never have gone over there. What do you think about it, Mr. K.? The gentleman is gone now. He says, "I believe your side has some merit to it." I told him "we would not go into your district and cut your prices." I said, "I believe there is honor enough about us in Illinois, we would not do that." I said, "All right, if you care to write me about the matter." A few days after he wrote me. However, his partner was at that convention, the National Dairy Show, and he met me and said, "You would stop our branching out." I said, "No, you can ship to the ends of the earth, but what would it profit a man if he sold 100 gallons of ice cream and made no money." Mr. K. wrote me a few days after, "There is merit to what you said. We have abandoned the field." In Southern Illinois those men have been loyal to the sectional meetings and they would not cut a price under our price unless they let us know, that is the kind of co-operation we have in Central Illinois.

Indiana, as I said before, is coming up very much, and at our border line we have adjusted matters so that prices are about the same. Last spring everybody was up against it as far as sugar was concerned, and we were all in hot water about the early part of April. Some were fortunate in securing some of the cheaper sugar, but some had to go to the limit. As a manufacturer and as an individual I got to thinking over the matter and I said something must be done. Nothing had been done up to that time. I went to Chicago to confer with Mr. Loewenstein—he was in Washington on the express matter at that time—and we arranged a meeting in Peoria along the latter part of April, and the Illinois chairman, George Thompson of Chicago, asked me to act as chairman, and in that meeting we got the testimony of every man present in regard to the conditions in his locality, and as I said before, we made no combine as far as prices were concerned, but automatically inside of ten days after that we had to advance our prices in order to get things in shape so we could have a living profit.

Last fall, in September, I got a wire from Indiana, one of the manufacturers there, asking me if I could come over and help them in the city of Logansport. At that time we were busy and I thought I would be unable to go, then I felt otherwise and wired them I would try and go. I got together a lot of data that would apply to the conditions and what it meant to lower the value of your product. New Jersey had a great experience in regard to poor ice cream and how the output declined very much until something had to be done and they found it was the low grade that destroyed the business. We went over there to Indiana and we held a meeting and we had a splendid attendance, but the idea of some of those manufacturers was they could buy sugar a lot lower and they could get the price. We were fortunate enough to stay the decline in the prices and there was some of our lively boys at that meeting. I tell you men we have got to be honest. I believe that the dollar in the hands of the ice cream men here is an honest dollar. It reads, "In God we trust," and we ought to support that inscription. Those fellows over there thought if they could get the price they could increase

CARAMALA DISTINCTLY INDIVIDUAL

CARAMALA, the favor compelling flavor, is now, most universally used. Since its first appearance on the market **CARAMALA** has enjoyed a distinct, individual favor by both the ice cream maker and the consuming public

IT IS A TRADE STIMULATOR

CARAMALA Ice Cream is always in season. It produces a smooth, rich, firm cream with a peculiar pleasing flavor that the consuming public likes. "Give me Caramala Ice Cream," is the universal demand and is evidence of the fact, that once Caramala Ice Cream is eaten, "they call for it again."

LET US PROVE ITS MERITS

Send in your trial order, and if any Caramala claim we make is not sustained by your Caramala experience, simply return us the shipment within 30 days at our expense.

Caramala Signs like these furnished. They help increase your business.

the consumption. Somebody gave us this. If I cut the price 10 cents and I am selling 100 gallons of ice cream, how much more have I got to sell to even my sales? Ten gallons. One hundred gallons of ice cream and he had an earning of 30 cents, that would be $30, but if he cuts the price 10 cents he has to increase it 50 per cent. In this, boys, figure on a reasonable margin. I know in Wisconsin here you have a very marked condition with the very low price of your raw product of the milk and cream and those things, while in Central Illinois prices are apparently quite normal at this time, milk is running from 3¼ to 3½ a hundred. We are, perhaps, more of an agricultural country than you are up here, and our farmers down there can do something else than produce milk, and therefore in building up an industry we feel we must pay them a price to warrant their continuing in its production.

If I have said anything at this time to help you I am very glad of it. We have held two sectional meetings in Illinois, one at Centralia, and one at Litchfield. We have held several conferences. When your secretary and your officers call for a meeting, whether it be in Green Bay or Fond du Lac, or where it is, I say to you men go and grow. I thank you. (Applause).

FOURTH SESSION.

Friday Afternoon, 1:30 O'clock.

Meeting called to order by President Smith.

Chairman: The first number on the program this afternoon is "First Impressions of Beginners in the Ice Cream Business," by Mr. Karl Mory, of the Mory Ice Cream Co., Appleton, Wis.

First Impressions of Beginners in the Ice Cream Industry.

By Karl B. Mory, Appleton.

I have been asked to say a few words about the first impressions of beginners in the ice cream industry.

Most of you know that this is our first season in the ice cream business and this places us in a position to view its various activities in probably a little different light than you, who have been in the business a number of years. And the one thing that we think stands out head and shoulders above all other questions, is a lack of proper organization among the ice cream manufacturers of the state of Wisconsin.

By this I do not mean to cast reflections on our present organization. It is a fine thing but it doesn't go far enough. We get together only once a year, and after a fine time for two days we all go home and do not see each other for another year. If you stop to realize, gentlemen, we are just about the most poorly organized industry in the state. And there is no excuse for it. Wisconsin isn't so large that we can't all get together once a month and talk business conditions over in an intelligent manner, instead of groping around in the dark the way we are now doing. Why even the buttermakers meet once a month and, are you going to be forced to take your hat off to them as a more intelligent body of business men than yourself? But that is just exactly what you will have to do.

I even know of one instance where the heads of two competing firms in a city of not over 30,000 population did not even know each other and they had been engaged in business there three years. Do you suppose that conditions like these promote the welfare of the ice cream industry? They most certainly do not.

Take our own business, for example. As maltsters and grain dealers we belong to the National Association and also to the State Association. The National Association maintained an office in Chicago under a very brilliant lawyer and we had a meeting there every month, and these meetings were attended by about 99 percent of all the malsters east of the Rocky Mountains. Now do you suppose these men would go to all the expense and time to come from distances as far as New York if they weren't dead certain that they were benefitted by these meetings? And I might further say that our business was never better than when these meetings were faithfully attended. And on top of all this we had our Wisconsin Association which met here in Milwaukee once a month. Surely the ice cream manufacturers could arrange their affairs so that they might devote one day out of a month to bettering conditions of their own industry.

My suggestion would be to open a small office in Milwaukee. I believe Milwaukee woud be the logical location for this office because it is more conveniently located for all of the manufacturers than any other city. The expense would be very small. All we would need would be one room under some capable man. We wouldn't require the services of a high salaried attorney at this time. But what I want to see done is to get the manufacturers working together instead of everybody pulling in a different direction.

With an organization such as I have outlined innumerable things could be accomplished. A credit

HE BEGAN WITH A HORSE, TUB AND A FREEZER.

L. Manuel Hendler is president of the Hendler Creamery Co. of Baltimore. He is also President of the Association of Ice Cream Manufacturers of Maryland. The advice of a man who has become prominent in the business world, through his own efforts, is worthy of serious consideration. Mr. Handler expresses his views in the following words:

"Have your letter of the 27th and while it goes without saying I have always urged every ice cream manufacturer to attend shows and conventions, yet of course you can understand Maryland is one of the smaller states and we really only have one large city to draw on. Besides the conventions this year will be so far from base I doubt whether we are going to have very many out of Maryland to attend. The larger fellows follow the conventions wherever they go, but because of the Supply Men's conventions near by the smaller men can very easily attend them.

"I started in the ice cream business just the same as a good many other large manufacturers, with one horse and one little tub and freezer and had I not attended the conventions, heard the men who know, speak, and gathered in the information I could by attending the shows, I probably would be working at one tub and can today.

"The money any man spends attending a convention he usually makes up on the first fifteen minutes at the show. With all the knowledge I have in the ice cream business I never go to a convention without coming back feeling repaid over and over again. In fact, being a large manufacturer the saving today is far greater than if my business were smaller. I feel fully convinced that every ice cream manufacturer should attend the ice cream shows and conventions and I can't understand why anyone should need any coaxing."

Custards *Flavors*

Maraschino Cherry Custard
Mothers Egg Custard

"Acme" Custards	An exact reproduction of the EGG or CHERRY.
Egg or Cherry	Contains all of Nature's delicate FLAVORS and BLENDED COLORS. A delicious Ice Cream of quality distinction. Working sample for 40-qt. freeze, 36 cents.
Bisque Ice Cream	An imitation of the real Walnut or Shelbark with a nutty flavor. Served to social and banquets as a special. Working sample for 40-qt. freeze, 60 cents.
Perfecto *(Trade-Mark)*	A tested smoother of special value in the making of smoothe and tough Ice Cream. Never fails to give satisfaction.
Concretes	Orange and Lemon Concretes are made from the finest fruits that grow in Northern Sicily.
Extracts *(Non-Alcoholic)*	36 different kinds of fruit extracts. Special blends of Vanilla.
Colors	Certified colors of all shades, highly concentrated.

bureau could be established, the cabinet question could be thrashed out and settled, and I might say right here that I honestly believe that within the next year or so you will see this practice abolished. The brewers were up against the same thing. When money was rolling in like water they thought nothing of setting a man up in business and giving him all his fixtures, but when competition became keener and dividends smaller they cut it out mighty quickly. And another thing this office could do would be to help work out the tub problem. I am just going to say a few words about the return of tubs and then I am finished.

The tub problem is no doubt a time worn subject with you. But nothing really seems to have been accomplished to make this service any better than it was five years or six years ago. Take our own example for instance. We had efficiency experts install in our plant what is considered one of the best tub record systems, but it doesn't work out entirely successfully.

Once a week our file clerk runs through the records and mails out cards requesting the dealer to return the tubs which we have charged to him. The dealer probably replies that he has sent the tub back but we never received it. We can't call him a liar and tell him that he has got the tub, because maybe he has sent it back and it is probably lying back of the depot or somewhere else and for the efficiency of our system we lose a dealer.

I have heard some people suggest a deposit on every tub, but I do not believe this would work out entirely satisfactory unless every ice cream dealer in the state did it and they ALL will NOT do it.

The brewers were up against this proposition at one time and they overcame it by all charging a deposit on kegs and cases, but there are fewer breweries than ice cream factories and that helped them put it across.

Take our own business for example. At one time we never charged for the sacks we shipped our malt in, and as we were selling well over a million bushels a year, we kept the bag factories running nights supplying the demand for sacks. Then the malsters woke up and charged the sacks up to the brewers and the trouble was over.

But as I said before, unless this is unanimous it never would work out on ice cream tubs.

Most all of you have salesmen out on the road with instructions to send back all of your tubs he sees lying around. But your salesman gets his salary for the business he sends in and not on the empties he finds, so do you imagine for one minute that he is going to run the risk of losing a customer by calling him down for not cleaning his cans and returning them promptly? I should say not.

My suggestion in this matter is for our association to hire a man six months during the rush season. Give him a Ford and let him do nothing but travel around the state and chase back empties. Keeping in touch at all times with our office at Milwaukee.

And I would go a step further. The state law clearly defines that all cans shall be cleaned and returned 72 hours after being empty. State Dairy Commissioner George J. Weigle has always shown himself to be very much interested in bettering conditions of the ice cream industry, and we could assist him very much by getting after the dealers ourselves. He could deputize our man without pay from the state, which would give him the necessary authority to wake up a few of the dealers. I feel sure Mr. Weigle would be more than glad to cooperate with us and would probably pick us out a very capable man.

I have figured out the cost of putting this man on the road and it would be approximately $100 a month. $200 salary and $200 a month expense to include all motor upkeep. The last list of state manufacturers showed a membership of 40, which would be $10 apiece per month. Not even the cost of two packers lying around somewhere. Isn't it worth that much to you gentlemen to know that someone is out chasing up your empties all of the time? Two men would be much more effective and that would only cost us $20 apiece. Or if you should prefer to prorate the expense, pay it the same as you do your dues in the National Association, according to gallonage.

There is just one other thing in which we are not quite up to the minute, and I refer to the National Ice Cream Association rather than ourselves, and that is cooperative and educational advertising. The same as the California fruit growers are doing, the can manufacturers and I have noticed that the coffee merchants of the United States have also recently joined this ever-widening circle with the slogan "Coffee—the Universal Drink." Why not "Ice Cream—the National Dish?"

The Wisconsin state association should go strongly on record endorsing a move of this nature and take it up with the national association at once.

I trust, gentlemen, that I have not taken up too much of your valuable time, but I do hope that before you return home you will make arrangements to meet here once every month.

I thank you. (Applause.)

Chairman: The next number on the program is "Let's Get Together," by C. W. Wright of the Sturtevant, Wright & Wagner, Beloit.

Mr. Wright: I don't think it is much use for me to talk after Mr. Mory's talk. Mr. Holmes is a regular get-together man—that is his business. That is the reason why Mr. Holmes can talk, doesn't have to read his paper. Mr. Holmes especially and Mr. Mory, too, their talks were on actually getting together of the ice cream man. I think I can show you why you are going to get together. I am going to make this statement, you are actually going to get together if you want to or not. I am going to give you some history, that is one reason why I have to read it, because I never was any good at remembering history.

* * *

LET'S GET TOGETHER.

By Mr. C. E. Wright, Beloit.

When our President, Mr. Smith, wrote and asked me to take this subject, "Let's Get Together," I nearly had a stroke of apoplexy for two reasons. The first and greatest one being—whatever put the idea into his head that I could appear on a program at all, and the second one—why pick on me to settle something that has taken several hours of our time at every ice cream manufacturers' convention we ever attended.

You all know how hard it used to be to get all of you together in a meeting even when you were privileged to sit far apart and not speak to your competitor. I think the reason must have been because you thought you knew so many secrets about ice cream that you dared not speak to him for fear you might divulge something that would cause him to make good ice cream too. And of course at that time there was only one man who could make real good ice cream—that was you. But you did finally come fully determined to keep your mouth shut and your ears open, for you had discovered that there were a few careless or shiftless people who were actually eating the other fellow's cream. And then one day at a friend's home, YOU ate some of it, and would you believe it, there was something about it that you would give a dollar to know just what he did to get that particular taste. So you came to see if he might accidentally disclose something. Now I am going to tell you why I think you came.

Improve Your Facilities

The installation of a **BAKER SPECIAL** Mechanical Refrigeration System would be the most important improvement you could make.

You would save the jobbers' profits if you buy a BAKER SYSTEM—We sell direct from the factory, and through our factory branch offices; hence, when you buy a **BAKER SYSTEM** you save the money that would go to the middlemen if you bought some other make of refrigeration equipment.

New York City, N. Y.

I know you are going to be disappointed in some respects when I finish because I am not going to tell you all the details of my little plan of getting the price of ice cream just as high as the traffic will stand and every manufacturer sticking together and maintaining that price. Of the oft cussed and discussed problem of furnishing ice cream cabinets, and of the method for everybody to use, to compel every dealer to pay promptly and return all your tubs next day.

Longfellow said: "Great is the art of beginning, but greater the art is of ending," so I am going to try to show you the art of beginning and leave the greater art for you to work out.

Let us go back to ancient history and see how people used to live by themselves and what the results were. The Canaanites occupied part of the territory which is now Palestine. The Philistines were on the west coast of Palestine. The Syrians were to the north and the Egyptians were to the southwest. Now Palestine is about one-third as large as Wisconsin and Egypt at that time was only a narrow strip along the Nile. Babylon and Persia together were about as large as Palestine and Egypt, which altogether might be a little larger than the state of Wisconsin. This virtually comprised the whole world. Yet the people were farther apart than they are today.

Each country had its own religion, language and customs and knew practically nothing about its neighbors and cared nothing except to conquer them. There was no intercourse between these nations except when they were at war. About this time a class of people who were descendants of Abraham and slaves to the Egyptians were freed by God, through Moses, and were led through the wilderness to the land of Canaan, and there began the first united people of the east.

This was about 1200 B. C., but this union was of short duration for it only lasted some 300 years. Then the Persians ruled the east until the Greeks and Romans conquered and ruled the entire country for centuries, which necessitated a mixing of customs and beliefs and drew the people nearer together. Each succeeding war, of which there were many, up to the 17th century, did its own part in getting people closer together, by the process of invading and settling in the invaded country and intermarrying with the inhabitants, thereby weaving a net that in time was sure to enmesh the entire world.

But there were old beliefs and customs that were not conducive to freedom, so later the Pilgrims came to America, where they thought they might worship their own way and live to themselves, but their very landing seemed to be the birth of a new and undreamed of freedom and unity of people.

We now find that the get-together idea was more pronounced in America than in any other part of the world, and we shall try to find out if it is worth while.

The Revolutionary War made it absolutely necessary that all people, regardless of religion or political belief, get their heads and hearts together to protect this unity of purpose and new idea of brotherly love from the old tyranny and one man idea. They did the job in fine style, and the result was the getting together of the thirteen colonies and the writing of the Constitution of the United States, which event will not be equalled until we sign some kind of a League of Nations.

What happened now that everyone was pulling together and had time enough to work for the betterment of mankind? Travel was slow. It was nearly impossible to do any business more than a few miles away. People in one colony had no means of knowing how those in another lived, but now the steam engine was developing, newspapers began to circulate, the telegraph began to flash news around and drew the people closer. Gold was discovered in California, and then the east and west mixed. The staid old easterner met the impetuous westerner and the energetic, liberty loving, central states man was the result.

But there was an undercurrent running through this stream of life that was not as it should be. There was a drifting apart of the north and south due to a practice that in the very nature of things was doomed. There were some men who thought each section of our Union could live by itself, but Abe Lincoln was here, and it is good for the human race that there is always a Lincoln when one is so badly needed. Men laid down their lives to hold the Union together, and that opened up another great epoch in the history of co-operation.

Electricity now began to do its share of getting people closer together and then came the thing that if Longfellow could have foreseen, he never would have made Hiawatha say:

"Face to face we speak together
But we can not speak when absent;
Can not send our voices from us
To the friends that dwell afar off."

After our own country succeeded in patching up the differences of the Civil War and had held the Union together, Spain made an attempt to enslave the Cubans, and again that brotherly feeling that had been growing for ages asserted itself and we stepped in and put a protecting arm around the Cubans and showed Spain her place, and at the same time, made a better friend of her.

While we were doing this, we tightened the bonds of friendship between the north and south because our boys fought together and lived together and discovered that they were all very much alike. After each war there seems to be a new effort made to help each other, and to invent new labor saving devices, and new ways of serving the people better.

Among other things the wonder of wonders—the automobile that actually eliminates distance and makes our neighborhood a hundred miles across instead of

"BERT" WILL BE THERE.

Tacoma, Wash., Sept. 1, 1921.

The Ice Cream Review:

There are so many good things that may be said for the National Dairy Show as an educational feature to those who are interested in any branch of the industry, that we feel sure anyone who does not make an attempt to visit the Twin Cities in October of this year will miss a splendid opportunity to become acquainted with the latest and best machinery and methods in the dairy industry.

The benefits to be derived by attending the sessions of the National Association of Ice Cream Manufacturers, the International Milk Dealers and others which will be held during the Dairy Show, are well known and appreciated by those who have attended in years past, and they in turn have induced others to join these associations who are doing so much to improve conditions amongst manufacturers.

With the excellent facilities and the central location we hope to see the 1921 Dairy Show on the Minnesota State Fair grounds the greatest yet held, and trust every manufacturer who can possibly do so will make a genuine effort to be there.

BERT H. WALKER, Secretary.
Pacific Assoc. of Ice Cream Mnfrs.

one. Then in quick succession the phonograph, the movie, the airplane.

Our present method of feeding the world. We don't eat the things native to Wisconsin alone, but we eat of everything in the world. We have cultivated our tastes until we like some of the things that pleases the South Sea Islander, and he eats our canned goods and meats. The salmon fisher likes our cheese and butter, while we eat his fish. We trade our wheat and corn for the southern man's rice, so even our tastes are becoming uniform. The people of other countries are wearing our clothes, and some of our women are almost wearing theirs; so we will soon be dressing alike.

The most outstanding example of what people can do by getting together has just been demonstrated by the great war. Germany thought the people of the United States were too busy getting money to notice what she was doing, but she seemed to forget all of our great organizations. We had no ships and no experience in building them, but we had Chas. Schwab, the man who knew steel and how to handle the great steel industry. We had no guns or ammunition, but our great, well organized manufacturing plants were making them over night. Our food industries were organized to such an extent that all our government officials had to do was to call a meeting in Washington and say we must have food. How can we get it? The milk canner said we will get you milk. The meat packers said we will get you meat. The farmer and his wife and daughter went out and raised the stuff, and we all did without bread, sugar and many other things to help out. We got together. Then we had a great number of religious, civic, and fraternal organizations which were supposed to be living just for themselves.

The Red Cross was willing, as usual, but how could they ever handle this job? They did it because every club and every individual laid aside their work or their play, and jumped in and went to work for them.

The Salvation Army was on our city streets every night and we passed them by with a casual glance, but when our country needed them, they were ready, but what could they do? They were very poor. The great order of Elks was not noted for its religious fervor, but when they did their bit, the Salvation Army had the needed money. That was quite a getting together. The Y. M. C. A. was having a struggle of its own for existence, but when the call came they said "here are we, send us," and we sent them with millions of dollars.

The K. C.'s had their huts along side and the two organizations did for our boys what no one else could have done.

While we who stayed at home were doing our work of paying the way, what effect did it have on us? Clubs and fraternities and individuals who were strangers, and sometimes enemies, are now woven together in one great fellowship, and all together we stamped out in a few short months what the Kaiser had been building for forty years.

He had the most wonderful machine that was ever built, but it lacked that co-operation of our thousands of little bands that could get together when the time arrived. We are now together and he is sawing wood alone. And still we have discovered that we need even Germany in our great plan of commercial life.

Since foreign nations have been unable to buy our goods on account of credit, we have become overstocked with goods and workers so we see more and more the need of getting together, and just now during the depression we must go through, it needs clear thinking and sound judgment.

Now as we have traveled around the world and have been drawing nearer home to our own family of ice cream manufacturers, and found that when we say "Let's get together," which is "Let us get together," we find who "us" means. It means the human race, but let us think now for a few minutes of the particular people with whom we are vitally interested regarding the manufacture and sale of ice cream.

We have worked backward so far in this paper so we may as well finish that way, and consider the consumer first. He has been educated to eat ice cream by having it forced upon him, but now you have him in the habit, he is going to demand some things of you. You taught him and now you must be taught by him. He was not so particular about his cream until he learned that all was not ice cream that was cold. He soon discovered that some of it was being made in filthy cellars and backrooms, while some was coming from modern, sanitary factories. Now the consumer can not tell by looking at ice cream, or tasting it, what kind of a place it was made in and as he had his own work to attend to, you could not expect him to go from factory to factory on a tour of inspection each time he wanted to eat some. So he did what you are doing in other lines, having your law makers make laws and hiring some good executives to see that they are obeyed. You will find the consumer a mighty good party to get together with. He will do you a lot of good, and pay you a fair price if you give him the kind of service he desires. And why shouldn't you do that? Have you taken into account just who he is? He is not the fellow over in the other part of town, but the consumer of your goods is your best friend, your next door neighbor. Your wife and children and yourself. Don't you think enough of yourself to make the finest ice cream possible, and to use the best and cleanest ingredients that money can buy? Your customer is also the man who milks the cow. He is eating lots of ice cream to-day and he is entitled to the best you can produce in exchange for the best milk he can furnish you. He is entitled to fair pay for what he does. If he should lay down on his job, where would you be? You would have to go back to making some of the old 4th of July cream that always did the maker so much damage that it took him another year to make the people forget it. Now-a-days most manufacturers figure the 4th is a good day to put out mighty good stuff, if for advertising purposes only, and people eat so much then that it is a good plan to start creating an appetite so they will buy regularly. It is not the rush days that make you your money. Your expenses are too high on those days; it is your regular trade that pays you. That is the reason for the week end specials, they help sell regular cream the next week. So much for the consumer.

There is another fellow you must not forget. Having just referred to the pure food officials, they are another very important body of men with whom we should be in close touch at all times. We used to look upon state food of officials and inspectors as an unnecessary evil imposed upon us, but times has changed our viewpoint in that respect. Food officials are our protectors. They are the men who our consumers have hired to look after their interests, but on account of their daily contact with the business they are a very valuable aid to us as they are supposed to know what the consumer wants and to be able to give us ideas on plant equipment as it pertains to sanitation. They are not responsible for the laws, but are just responsible for their enforcement. So if we have laws that we do not think are right or just, it is up to us to get together with these men and try to convince them so they will take the matter direct to the

law makers. You will nearly always find these men conscientious and ready to lend a helping hand if you show any inclination to do your part in this little home coming.

The ice cream supply man. You possibly wonder why you should bother much about him, he will come anyway. Don't be too sure you don't need him. He is in a legitimate business and is just another spoke in the wheel of progress. He is not living for just what he can squeeze out of you, but is ever ready to listen to your ideas and suggestions and improve his goods so they will better meet your requirements. He travels continually and brings you more new thoughts and tells you more of what your brothers in business are doing than any man you meet. If it were not for him you would not know whether there were any better supplies than those you had always used or not. There would be no improvement in that line. You may not want his goods, but you owe it to him to treat him with all due respect. It costs you nothing and you might be surprised some time to know how much good came out of it. The closer you keep to him, possibly the better prices you will get, any way, treat him like a gentleman for I think the traveling fraternity has as big a percentage of gentlemen in their midst as any other business on earth. (I ought to be able to buy pretty cheaply this year after saying that, don't you think?)

The business man along the street is another factor in your business you should not neglect. He is your brother in many ways. He can readily understand your problems and is a tremendous power in the community, so you should be very close to him. We used to think his business always sailed along nicely and he had no problems to speak of, but since the war work has made us work by his side, we have learned to know him, and we have been surprised to find that he had some things to do that were harder than we ourselves had.

The Rotary and Kiwanis Clubs are both great institutions to bring the business men together and they are only one more step in this great movement. They exist for service to mankind. Don't forget the little child who wants to look around your plant. If you are too busy to pay much attention to some salesman, to one of your business associates, or one of your rich customers, you had better get busier when some little boy or girl begins to ask questions and proceed to entertain them to the best of your ability, because if you offend or slight them you may as well slight their whole family, and half the school.

The next man in line with whom we must work hand in hand is the retailer. We hear a lot about him just now, but we must remember that he is not the only man who has taken war profits. Now here is a place where we can get in regular "Get Together" work. If we will put our problems up to this man and he will freely tell us his troubles, we might all work to better advantage. I don't mean for you to give him all the equipment he needs to run his place and pay his rent, or buy him a new suit of clothes occasionally, nor do I mean for him to tie himself up to you in such a way that he cannot buy cream of anyone but you. He has the right to buy the kind of goods that suits his trade, but how do you know what kind of goods the trade wants unless you listen to him, and how does he know what he is getting unless he will let you show him. I think if the average retailer knew more about our plant, our source of supply, our manufacturing problems and all of the little troubles we run up against, and we knew more of his, we would eliminate a lot of the petty grievances that arise between us. He would make a greater effort to return our tubs, pay our statement more promptly and get his orders to us on time oftener, and in many ways help to facilitate our service. We, in turn, knowing the demand made upon the retailer, by his particular customers, would be in a better position to help him. Why not have meetings with our retailers and talk such matters over? It would create a friendly feeling and show that we were really interested in him as a man, and not merely as a place to sell our goods. We have been hashing over this question at all our conventions: Is the retailer not charging too much for his cream with the result that it is curtailing its consumption? Now if we could get together with him and thrash out this matter, we might find some remedy. We might be able to convince him that he should cut down on his margins and increase his sales more than enough to make up the difference. If we did nothing more than settle the matter in our own minds, it would be time well spent. We might also convince him that when our price goes down to him, it is time for him to reduce too, unless he could show us some reason for not doing so. We might also prove to some of the shiftless ones that tubs, cans and cabinets cost lots of money, and they should be well taken care of. There are many things in common for us to talk over, and I think we might better our service, reduce our costs, and save a lot of our worries by just getting together.

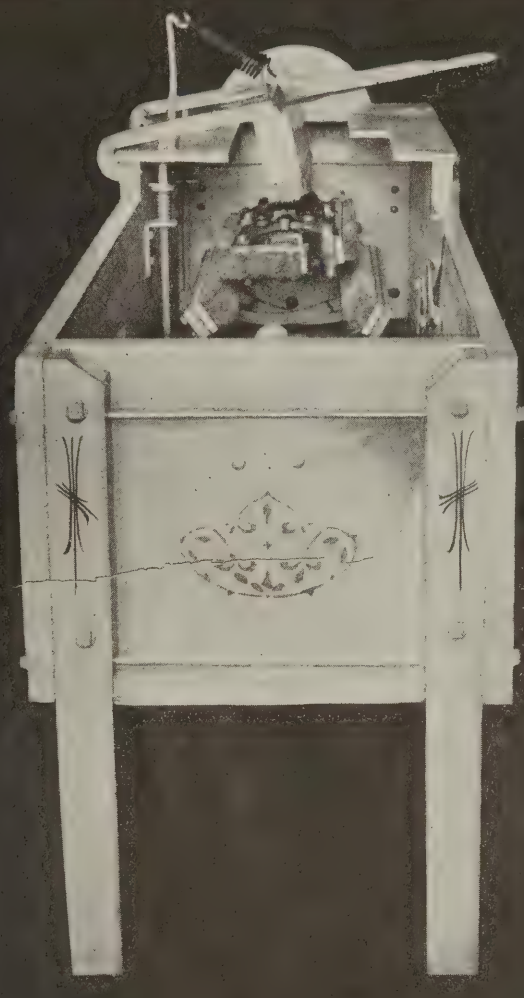
Now I have arrived at a place where it is absolutely necessary for a "Get together" meeting, whether it is done in a regularly called meeting or only in spirit I will leave with you, but it must be done somehow. It is being done in your plant to a large degree. This I know to be true, or you would not have the plant and the business you enjoy. It is your employes and yourself. It is true you were about discouraged last year trying to get men to work with you but you got through it by changing men until some one did stick with you, and you owe those men something. You paid them their wages and sometimes big ones, but you owe them something besides money. You owe them your lasting friendship and good will, better working conditions, the best possible schools and social conditions, and in fact your continued effort to make their lives as easy and pleasant as possible.

Your ice cream maker and yourself must pull together or your cream will not sell. Your salesman must be in the ring or his efforts will be in vain. What would your maker do if the engineer should run his machinery when and how he pleased? What if your office girl gave the packer an order and he tore it up, or even if he packed it and the delivery man did not care where he took it? You probably do not stop to think that there was so much co-operation in your plant. Your people are not working for your money, they are living this life in the way God intended they should. They are interested in your place. They even say "our factory" when they go home to their family, just as if they were a partner in your business. They are just as necessary to your good ice cream as you are. You may have worked out the plan of your business and the receipt for your goods, but the chances are you did not. Did you not get some good ideas from some one of your employes at some time or other? Did you ever hatch up some pet scheme that you was sure would make you a lot of money and then have some fellow in your factory suggest some reason that it would not work and make you feel foolish because you ever thought of it? Did you ever run a factory absolutely by yourself, with all your own ideas

and get away with it? If you ever did, you are worth a lot more money to some big corporation than you are now earning at your own business. If you thought you had a corner on all the good points of your ice cream or on your factory lay out, go home and forget it, and ask the poorest man you have on the job if he has any suggestions to make and he is liable to make you ashamed of yourself by telling you something you should have thought of long ago. Get together with your employes, if you have not manhood enough in you to do it for the good of civilization, do it to make money, for it will do the trick.

At the close I want to say there is little use for me to talk about getting together with your competitors. That is what we are all here for. Not to fix prices, not to say you shall do this, or that, but to see if we cannot understand one another better; for the very fact that we do know each other better, and realize that the other fellow is a pretty nice square fellow after all, will solve most of our squabbles as we meet in competition. In fact there will be no squabbles to settle, for when we hear from our trade what the other fellow said about us or have it tipped off on the quiet all the wonderful things he is going to do for his, or our trade, we will learn to take it with a grain of salt, and as we go into the new year, let us all **remember** the mistakes **we** made and forget the short coming of our neighbors, and set out to live right and help everyone with whom we come in contact to do likewise.

Ice cream makers of Wisconsin,
Grandest State in all the Union,
At this annual State Convention
We have met to hold communion
With each other on the subject
Of the art of ice cream making,
Each one giving, each one taking.



Why not let us get together?
Help in sorrow, share each pleasure
In our work or in our play time;
Live our lives in fullest measure,
Thus create that kindly feeling
That all storms of Life shall weather,
We can make the world more happy
If we'll only get together. E. K. W.

(Great applause.)

Chairman: This ends our program with the exception of our business meeting, which will be held in this room, for members only.

The Badger Flyers are to meet immediately after this meeting in the same room that they met in yesterday afternoon.

Our business meeting is for manufacturers of ice cream only.

STEAMBOAT LINE ADVERTISES BUFFALO CONVENTION.

Our good friend, H. W. Black, of Lakewood, Ohio, sends us an illustrated folder issued by the Cleveland & Buffalo Transit Co., in which they print an appeal to ice cream manufacturers and ice cream supply men to attend the Eastern Regional Exposition in Buffalo, October 31 to November 5.

Mr. Black says: "It isn't bad advertising for the Supply Men's Association, when a first-class transportation line recognizes them to the extent of advertising their convention this way."

REDWOOD provides durable milk plant equipment

What one user says of Redwood tanks

"We have used Redwood tanks and vats for heating buttermilk and skim-milk to a hundred and sixty degrees for ten years. Have two Redwood tanks in use six years condensing exhaust from engines, very often water near boiling."

Changed to Redwood for cheese factory equipment

"When we started in business manufacturing cheese factory equipment, vats, presses, etc., we used ————————. Although we did not have any complaints, outside of its being so heavy to handle, we thought it best to change to Redwood, which we found to be very durable. We have never had a complaint of Redwood rotting, and know of no better wood to use in a business like ours."

Advertises Redwood ice cream cabinets

"Made of Redwood because it is the best non-conductor of heat and resists rot or decay, alkalies, acids and moisture. Keeps ice cream hard. Saves ice," says one refrigerator manufacturer.

Why you should specify REDWOOD

Redwood is light in weight.

It resists the action of acids and alkali solutions.

Properly dried it neither shrinks, warps nor swells.

It is highly resistant to the passage of heat and moisture.

It can be given any finish from a light rose to a dark mahogany.

Holds paint and varnish well.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—We are getting only about 75 per cent overrun and we want to know why. Is it in our mix, or is it in the machinery? The following is our mix: 14 cans sweet pasteurized cream, 20 per cent; 5 cans No. 0 condensed milk; 2 cans whole milk; 300 pounds sugar; 12 pounds gelatine.

What is the test of the finished product?

Yours truly, H. M. P.

Reply: I have analyzed your ice cream mix as stated and you will find the calculations given below:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
14 cans or			
1148 lbs. 20% cream	229.6	164.47	394.0
5 cans, or			
475 lbs. condensed skim	....	128.25	128.25
2 cans, or			
170 lbs. whole milk 4%	6.8	14.50	21.30
300 lbs. sugar	....	.....	285.00
12 lbs. gelatine	....	.....	11.40
2105 lbs. mix	236.4	307.22	839.95
Per cent	11.2	14.59	39.9

Per cent sugar 14.25.

The table shows that your product will test about 11 per cent butterfat and nearly 40 per cent solids, the per cent of sugar being better than 14 per cent. You are working with a formula containing too high a per cent of total solids to get a satisfactory overrun unless you change the usual routine for handling the mix and running your machinery.

I am afraid that you are also going to have trouble with crystallization of your ice cream mix, due to the use of a large amount of condensed milk. I believe that if you will reduce the amount of sugar to about 13 per cent and reduce the amount of condensed skim milk so that the serum solids will not be over 11 or 12 per cent, you will not have this difficulty with your overrun. Your 40 per cent solids mixed could easily stand better than 100 per cent overrun compared with an ordinary 33 per cent solids mixed.

I suggest that if you are not able to work your formula over according to the suggestions stated above you write to me again and I will assist you in any way I can.

* * *

Dear Sir:—Kindly advise us what is the best coloring to use in ice cream to make it a little more yellow or richer looking. Thanking you, we beg to remain,

Respectfully yours, F. I. C. CO.

Reply: The usual color used to color ice cream is the ordinary cheese coloring, which you can secure from practically any dairy supply house.

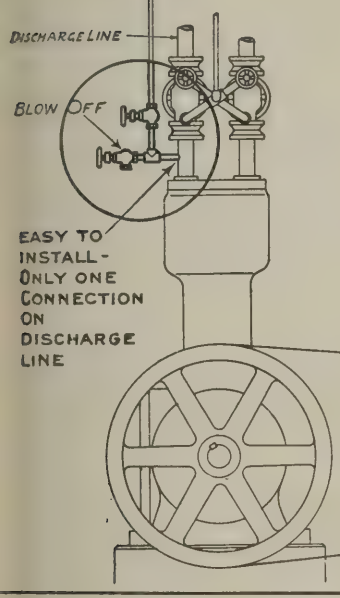
* * *

Dear Sir:—Have you any data relative to the proper packing of ice cream, both as to quantity and packing as regards the amount of salt to be used in different size tubs? We are having some complaints about our cream becoming soft and ruined, but upon inspection as it leaves our packing room for shipment, it is perfectly hard. We cannot understand these complaints and are just wondering whether others are having the same trouble or not. Could there be anything in the

To The Man Who Uses Refrigerating Machinery

Here is Something Designed to Help You Cut Out Trouble and Cut Down Overhead

Excessive ammonia pressure is at the root of most of your ice machine ills. The *Monogram* PRESSURE CONTROL shuts down the compressor before pressure even thinks of getting dangerous.



It will eliminate 90% of your refrigerating plant troubles.

9 S. Clinton St. Chicago, Ill.

ingredients of the cream that would cause it to act in this manner? Very truly yours

C. I. C. CO.

Reply: The trouble which you described regarding the softening of your ice cream when it reaches your dealers is something which I have not run across in my correspondence with hundreds of factories. If the cream leaves your hardening room when it is packed for shipment in a good solid condition there is no reason why it should become soft in shipment if you use the proper method in packing it.

It is possible that your dealers do not take care of the packer when the shipment arrives and expects the cream to stay hard and firm without extra icing and salting. It is also possible that your mix is not quite right, in that you do not use enough filler to keep the cream in good shape under average shipping conditions. I shall be glad to analyze your mix for you in this respect.

* * *

Dear Sir:—We would like to have your opinion regarding the proper temperature for pasteurizing mix composed of butter, whole milk, milk powder, sugar and gelatine; also state at what temperature and pressure should the mix be run through the viscolizer.

Yours truly, C. R.

Reply: The best temperature for pasteurization is 145 degrees and the mix should be held there for at least thirty minutes.

It may then be cooled to 120 degrees before passing through the viscolizer, the constant pressure as heavy as the machine will carry. I do not know what viscolizer you have and cannot give you the exact pressure at which you should operate this machine. You undoubtedly have a set of rules with the machine, or you can write direct to the manufacturer and obtain this information.

* * *

Reply to F. C. B.: I am glad to state that I believe we have in Oklahoma and Kansas an ideal law relative to the legal standards for ice cream. The law in Oklahoma requires that ice cream test at least 10 per cent butterfat and should have a total solid content of 32.5 per cent. The Kansas law is a little more specific and better than ours in providing 10 per cent butter fat and 20 per cent total milk solids. This means that when only 10 per cent butter fat is used additional milk solids must be provided by using condensed milk or milk powder thus giving the same amount of milk solids as a 14 per cent ice cream without additional serum solids.

I suggest that you write to the State Dairy Commissioner, State Board of Agriculture, Oklahoma City, Oklahoma, and to the Dairy Commissioner at Manhattan, Kansas, College of Agriculture, who will be glad to send you some printed matter regarding the laws of Oklahoma and Kansas.

* * *

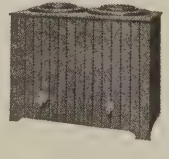
Dear Sir:—I would like to have you answer me a few questions. What formula or what percentages would you use to make the best ice cream, regardless of cost? We are using about 9 to 9½ per cent fat, 10

The Public Knows Mapleine

Specialize on **Mapleine Ice Cream** and take advantage of Mapleine's popularity as a home flavoring.

Practically every fourth family is a constant user of Mapleine and all good grocers sell it.

Mapleine



puts into ice cream the flavor of maple itself. It will not freeze out and holds true no matter how long the ice cream is stored.

Call your product **Mapleine Ice Cream** and it will find ready sale with customers who know and appreciate the unsurpassed flavor of Mapleine.

to 10½ per cent milk serum, 33 to 33½ total solid We use fresh stock and high price vanilla and frui but somehow we have not been able to create a d mand for our cream. We use Sharples Emulser an run it 16000 revolutions per minute. We age 12 to 2 hours and get about 75 per cent overrun.

I notice you advise about 11 to 12 per cent suga whereas another authority advises 14 to 15 per cen We find that if we increase our serum solids and d crease our sugar we get sandy cream. A. M. B.

Reply: Our experimental work over the period o four years seems to indicate that an ice cream co taining 10 per cent butterfat and about 10 per cen milk serum solids making a total of 33 to 34 per cen solids, makes the most satisfactory ice cream from a points of view. This product is properly balanced fo butterfat and protein and should not contain over 1 per cent sugar. If 14 or 15 per cent sugar is used th product is again over-balanced in carbohydrates, and from the standpoint of a balanced food, coul not be considered as good. You easily realize tha various authorities have different opinions on this sub ject. I believe, however, that my opinion on this ma ter, based on careful experiments made through series of years under actual commercial conditions i probably as near correct as it can be. Further investi gations along this line will undoubtedly bring out som new opinions.

* * *

Dear Sir:—Will you please write and tell us hov to make sherbet in the following flavors: lemon, ba nana, pineapple, strawberry and cherry?

Cordially, S. I. C. CO.

Reply: Sherbet can be divided into three classes first, milk sherbet; second, a water ice, and third, modified sherbet containing some milk. We have ha very fine success with sherbet when proportioned a follows:

Formula No. 1—Milk Sherbet.

57 lbs. sweet skim milk or 52 lbs. water and 5 lbs. of skim milk powder.
18 lbs. sugar.
4 ounces gelatine.

Formula No. 2—Water Ice.

58 lbs. water.
20 lbs. sugar.
6 ounces gelatine.

Formula No. 3—Modified Sherbet.

Half milk and half water instead of skim milk given i Formula No. 1.

These three formulas above suggest the basic mix to which of course must be added the lemon juice and the fruit. One quart of lemon juice and about 100 c.c of a saturated solution of acetic acid is correct to add to the above mixes. This lemon juice and acid as wel as the fruit must not be added until the sherbet is al most frozen in the freezer. For the purpose of making pineapple sherbet or strawberry from one quart to one and one-half quarts of good concentrated crushed frui is added at the same time that the lemon juice is added

In addition to these fruits we use sufficient amount of true fruit flavor to bring out the color of the sher bet made. It is of course necessary to add a little color in making a banana sherbet. The acid and lemon juice must be reduced, as this kind of a sherbet does not want to be as strongly acid. The bananas should be chopped fine and added to the sherbet along with a little banana flavor.

Lemon sherbet will require more pure lemon juice than the other sherbets along with some lemon ex-

ract crush. Many factories do not use any lemon uice, but depend entirely upon the saturated acetic or the acid in the sherbet. This only cheapens the product and is not nearly as satisfactory as the lemon uice.

The most important part of making a sherbet after he mix tests correctly, is to freeze it properly. Perhaps more sherbets are ruined by improper freezing han by just not having them made right. Too much overrun gives a snowy, tasteless product regardless of the mix used. In order to keep the overrun down he mix should have a temperature of about 35 degrees before freezing. A brine should pass through he freezer and be at a temperature of from 0 to 5 degrees. The freezing should be done rather rapidly nd the sherbet frozen quite stiff so as to prevent the ugar, acid and fruit from settling to the bottom of he can.

The hardening room should be at a temperature of to 10 degrees below, so as to harden the sherbet as uickly as possible and kept there until sent out. If he product gets too foamy or the overrun too high t is best to leave it in the freezer and freeze it stiffer o as to get rid of some of the air until the sherbet as a solid, granular appearance.

I shall be glad to hear from you after you have ried out these sherbets.

* * *

Dear Sir:—I am enclosing two formulas of ice ream mixes which we have been using, and kindly equest your criticism of them. The figures used in omputing weights and percentages are taken from Mr. Washburn's tables in the April number of The Review.

We aim to have our mix contain about 12 per cent utterfat. The total solids seem high, so we can probbly cut down on the sugar content somewhat. What overrun could we obtain with these mixes and still btain an A-1 product?

Our plant is located in the country and the cream nd milk used are obtained directly from the producrs, so we find these constituents are the most conenient to use, as well as being the most economical, uality considered. We pasteurize and homogenize ur mix after which it is held in the coolers for 48 to 2 hours before freezing.

Will you please suggest three formulas made of he ingredients we are now using, i. e., cream, milk, nd evaporated milk, but in the proper amounts necesary to contain 10, 12 and 14 per cent butterfat, and aving the correct percentages of serum solids and ugar.

Is there any method which one who is not a chemst may use to determine the serum solids contained n a mix, other than by use of apparatus made especialy for this purpose.

Our plant is putting out from 250 to 400 gallons daily at present using two Miller horizontal 40 quart freezers. What is an average hourly output for a freezer of this type? Yours very truly, E. G. R.

Reply: I have analyzed your two mixes and you will find my figures given below in Tables No. 1 and 2. You will note that the total solids of both of these mixes are a little high, which is due to a high per ent of sugar. When ice cream tests 12 per cent butterfat or over it is hardly necessary to use more than he 12 per cent sugar. I prefer to recommend making ice cream with less sugar and a little more milk erum solids.

Ingredients	Fat	Serum Solids	Total Solids
672.0 lbs. cream, 25%....	168.0	44.86	212.86..
300.0 lbs. milk, 40%....	12.0	25.64	37.64
311.25 lbs. evap. milk...	27.1	62.25	89.35
7.5 lbs. gelatine	....	.....	7.12
224.0 lbs. sugar	....	.....	212.80
1514.75 lbs.	201.10	132.75	559.77
Per cent	13.77	8.70	36.80

You could very easily improve your mix No. 1 by reducing the sugar to 13 per cent and increasing the serum solids to 9.5 per cent. Similarly your mix No. 2 could, in my opinion, be improved by using less sugar and more serum solids. I would hardly recommend using larger amounts of evaporated milk in your case but rather to use skim milk powder.

I am returning your own analysis of your mix No. 1 and 2 and you will notice I have indicated a correction in your total solids of the cream in your mix No. 1. I am also giving below, under tables Nos. A. B and C, three suggestions for 10, 12 and 14 per cent mixes:

Mix No. A—10% Fat.

Ingredients	Fat	Serum Solids	Total Solids
14.0 lbs. sugar	....	.....	13.30
1.0 lb. gelatine and flavor 12 oz. gelatine.	....	.....	.75
20.0 lbs. evap, milk, 8% fat	1.74	4.00	5.74
27.0 lbs. 25% cream....	6.75	1.80	8.55
38.0 lbs. 4% milk.....	1.52	3.26	4.78
100.0 lbs.	10.01	9.06	33.12

Mix No. B—12% Fat.

Ingredients	Fat	Serum Solids	Total Solids
13.0 lbs. sugar	....	.....	12.35
1.0 lb. gelatine and flavor	....	.....	.75
20.0 lbs. evap. milk, 87%	1.74	4.0	5.74
36.0 lbs. 25% cream.....	9.00	2.41	11.41
30.0 lbs. 4% milk.....	1.20	2.57	3.77
100.0 lbs.	11.94	8.98	34.02

Mix No. C—14% Fat.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	....	.....	11.40
1.0 lb. gelatine and flavor	....	.....	.75
20.0 lbs. evap. milk.....	1.74	4.00	5.74
46.0 lbs. 25% cream.....	11.50	3.07	14.57
21.1 lbs. 4% milk.....	.84	1.80	2.64
100.0 lbs.	14.08	8.87	35.10

Regarding the method of determining the serum solids in a mix no simple test can be used for making this determination. The Mojonnier Tester and the ordinary apparatus for butter moisture tests determines only the total solids. The serium solids may be calculated differently. For instance, if the mix contains 10 per cent butterfat, 12 per cent sugar and 1 per cent gelatine, and as a total solids of 34 per cent, the serum solids would be the difference between 24 and the total of the butterfat, sugar and corresponding solids or in this case it would be 11 per cent.

Dear Sir:—I am a subscriber to The Review, and I see you are willing to co-operate. I am trying to make an ice cream with the proper ratio between butterfat and solids not fat. In figuring my solids, I use gum and sugar as total solids, skim milk powder as .98 per cent solid, skim milk as .09 solids. The following is my formula:

	B. Fat	S. N. F.	T. S.
.5 lb. vanilla	....	.....	.....
.5 lb. gum	....	.....	.50
13.0 lbs. sugar	....	.....	13.00
1.0 lb. skim milk powder.	....	.98	.98
85.0 lbs. 16.5% cream....	14.025	6.387	20.412
	14.025	7.37	34.89

My fat costs me .42 cents per pound and skim milk powder .19 cents per pound. Can you suggest a change in my formula that will make as good a cream for less money, of a better cream for the same money? I would rather make it better than cheaper. I see that some makers of ice cream pasteurize their mix. How long should a mix stand after pasteurizing before it should be frozen? What is gained by pasteurizing? In making my mix I use raw sweet cream, emulsion, and raw milk. What might I gain if I pasteurized my mix and held it for thirty-six or forty-eight hours at a temperature of thity-five to forty degrees? Yours truly, W. C. F.

Reply: I have looked over your formula and there is nothing wrong with the calculations, as you have made them, except in one instance, where you stated that you figured skim milk .09 per cent solids. I presume, however, that you are doing this right and use 9 per cent solids.

I notice that you are using 14 per cent butterfat, while your state law only required 8 per cent. I presume that most of you competitors are using 8 per cent fat. I suggest that if you decide to cut the per cent of butterfat you add one pound of skim milk powder for every pound of butterfat you reduce. I believe you would have a much better balanced ice cream if you used 10 per cent butterfat and 10 per cent milk serum solids which would make a total of 20 per cent milk solids.

Pasteurization of the ice cream mix is a very essential part of processing an ice cream mix. It is necessary from the standpoint of health, and also enables the ice cream factory to control the freezing, overrun, and the physical make-up of the ice cream. When an ice cream mix is pasteurized, heating to 145 degrees and holding it at that temperature for thirty minutes it is necessary to cool the mix and then hold it to a temperature of 40 to 45 degrees for at least twenty-four hours before freezing. Many factories hold it forty-eight hours, which is better if you have the storage room for doing this.

I shall be very glad to hear from you again as to what results you get in case you decide to change your system of handling your mix.

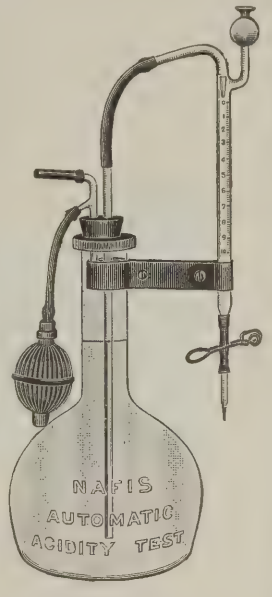
Nafis Automatic Acidity Test

For Testing the Acidity of Ice Cream Mix, Milk, Cream or Whey

ACCURATE CONVENIENT SIMPLE

for Ice Cream Plants, Cream Grading, Creameries, Cheese Factories, Condensing Plants and Dairy Schools.

Our INDICATOR and NEUTRALIZER are put up in convenient form and can be sent by parcel post for a few cents.



Our CONCENTRATED NEUTRALIZER is prepared in our laboratory with the same degree of accuracy that characterizes NAFIS GLASSWARE. The small bottle is sufficient to make a half gallon of solution, thus avoiding transportation charges on large bottles and water.

Complete test includes one bottle of each solution.

Our new style Volumetric Reservoir Flask permits the proper dilution of the concentrated neutralizer with great precision.

Broken parts easily replaced.

For Sale by All Dealers in Nafis Glassware.

Designed and Manufactured by

LOUIS F. NAFIS, Inc.
Manufacturers of Scientific Glass Apparatus for Testing Milk and Its Products.
544 Washington Blvd., Chicago, Ill.

BRICK ICE CREAM FOR SALE HERE!

This advertisement appears in many grocery stores in the state of Wisconsin, and while the idea of selling ice cream through grocers may not be new, nevertheless, it is not practiced around the haunts of the "Jack Rabbit" and "White Caps", and to these valued exponents of good ideas I invite attention:

Doesn't this suggest an opportunity to help increase the business of our customers? Don't you believe that wider distribution means more "boosters" and more ice cream sales? Isn't it logical to think of ice cream—a food—being sold in food stores?

Who is in better position than the grocer to impress upon the housewife that ice cream is a food, and to suggest it as such for dessert, when soliciting her grocery order?

I believe the wide-awake groceryman would welcome the opportunity to handle a quick selling, profitable article, such as ice cream, and if it is brought to the attention of the ice cream manufacturer I'm sure they can make capital of it.

Let's mention it to them!

Another idea was suggested in a recent editorial in The Ice Cream Review. The writer was criticising the soft ice cream as served in a Milwaukee cafeteria, and wondered why the proprietor did not serve individual slices put up in boxes made expressly for that purpose.

All the cafeteria man needed was someone to tell him of this method and say that nearly every ice cream man would gladly furnish him ice cream put up in neat packages all ready to serve. He probably would have quickly made the change.

There are many cafeterias to which this idea would appeal, and as long as we have dedicated ourselves to be boosters for ice cream, why not mention it at our next meal? (I realize that there are few "peddlers" who eat in cafeterias while travelling on an expense account, but they may do so occasionally, while in their home city.)

Ask for ice cream every place you eat, and if it is not served except for Sunday dinners, as in some places, ask the proprietor if he knows that nearly all his guests are now in the habit of eating ice cream every day, and not only on Sundays and holidays as in "days gone by."

Before closing I will relate a conversation witnessed between Mr. Johns, of the M B Ise Kream Company of Waco, and "Old Reliable" (?) a negro "utility man."

It seems that the negro had been told to do something and had reported that it had been done. It developed later that he was not telling the truth and Mr. Johns called him to task.

Mr. Johns: "Reliable, why did you tell me while out in the engine room that you had finished that job? You know you were lying."

Reliable: "Well sah, Mistah Johns, those machin-

ery was makin' so much noise I jus' couldn't hear what ah was sayin'. Yessah, Mistah Johns, Yessah, I'm on mah way right now."

If you do not believe this, ask Fred Peale.

KARL R. ZIMMER.

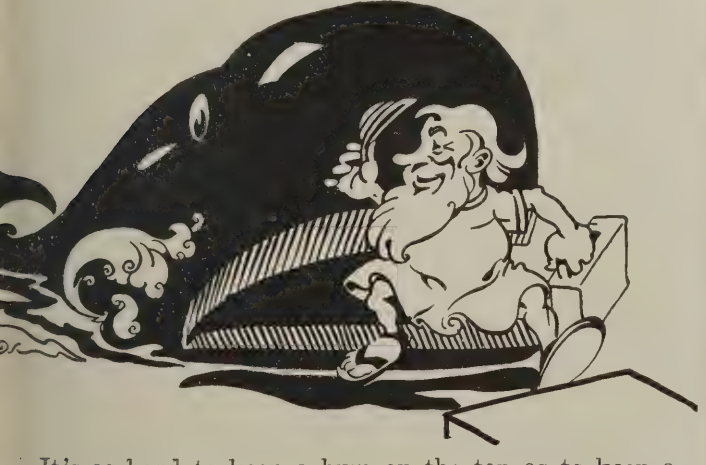
FRIDAY NIGHT.

There's a lot of things about this world
That I'd change over night,
If they'd give me the job and say,
"Now fix her so she's right."
I'd shanghai crabby buyers,
And I'd burn the bum hotels—
I'd raise my salary every day
And I'd live high, like the "swells".

I'd make my trips in Packards—
I'd wear diamonds night and day.
There aren't many things I'd let alone
If they'd let me have my way.
There's just one thing I wouldn't touch
There's one thing they made right
They did a good job—that's no kid—
When they gave us Friday night.

On Friday night I hit the grit
And end my weekly roam—
The 8:10 out of Logansport
Takes me back to the kids and home.
I'd "can" the 8:10 crew and all—
I'd tell the "con" to fly his kite
But I'd keep the same old calendar
And thank the Lord for Friday night.

—The Salt Seller.



JONAH SAID, "I'M OFF YOU FOR LIFE, YOU POOR FISH."

You can't keep a good man down.

Jonah and a jelly-fish found themselves in the basement of a whale.

Jonah took the first elevator going up—the jelly-fish stayed there.

That's a common story.

It's as hard to keep a bum on the top as to keep a good man down.

Everybody has a back-bone with his head at one end, and at the other—a place to sit down.

Some guys use one end most—some use the other.

Anybody can tell which end the guy uses by his pay check—heads he wins, tails he loses.—From an "Every Store" folder issued by the Ivan B. Nordhem Co., N. Y.

MAGNETIZE ICE CREAM

With a Mysterious, Alluring, Delightfully Tempting Flavor and Fruity Taste that will draw customers as a magnet draws steel.

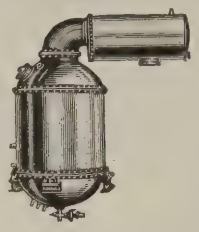
"What is it?" "Isn't it fine!" Yes, these and similar exclamations you will invariably hear, yet so supremely delicious is it customers always insist on more.

That's the kind of flavor and fruity taste you'll get by adding to your ice cream.

Blanke-Baer Honey Fruit Salad

Think what it would mean to you to ask thousands of customers their first choice of fruit, and flavors, and then offer those same customers a combination of a dozen or more of those first choice fruits and flavors, made into a **Supremely Delicious Ice Cream.**

That's Honey Fruit Salad—that's the tempting flavor and fruity taste that'll win customers and hold them—that'll overcome selling difficulties and gladden your heart.



Put up in gallon cans, 10 gal. kegs, ½ bbls. and bbls.

Don't lose time or wait for sample. Order TODAY a case (6 gal. cans) of this heavenly mixture. You'll be surprised at wonderful results and low cost.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Roanoke, Ala.—An ice cream factory has been added to the bottling plant of G. T. Anglin of Roanoke.

Mobile, Ala.—The installation of a complete ice cream plant on South Francis and Royal Streets has just been completed by Messrs. Albright and Wood. H. C. Hollister is in charge.

Osceola, Ia.—Fred Davis will open a creamery and ice cream factory here.

Aledo, Ill.—The Zales S. McGinnis Co. has been taken over by Clyde Sinclair, manager of the Sinclair Co. of Galesbulg, Ill., manufacturers of ice cream.

Decatur, Ill.—The American Ice Cream Co. is planning the erection of a new building for an ice cream plant.

Gibson City, Ill.—L. Frith has leased half of the Nobel Bros. seed warehouse on State St. and will start an ice cream factory. The new concern is known as the Frith Ice Cream Co.

Kokomo. Ind.—The Quality Ice Cream Co. has established a plant at 111 East Madison St. Its officers are: E. C. Rowe, president; W. H. Coughlin, vice president; G. A. Brown, secretary-treasurer, and H. Heady, general manager. The company purchased the business and good will of the Grocers Dairy Products Co. Plans are under way to double the size of the plant.

Belmar, N. J.—The Hildebrecht Ice Cream Co., has just completed the erection of a service station adjoining the Casino Ice Company plant.

Camden, N. J.—The Crescent Ice Cream Company, 507-9-11 Main St., has been incorporated at $125,000, by Emmons G. Elzey, Horace G. Elzey and Frank W. Elzey of Camden, and has taken over the business of the Excelsior Ice Cream Co., 507 Main St. The Manufacturing Distributing Company 314 Market Street, has been incorporated at $125,000 to manufacture confectionery and ice cream.

Coffeyville, Kans.—Under an order issued by Referee in Bankruptcy, C. E. Cory, at Fort Scott, a dividend of ten per cent will be paid all creditors of Brooks Ice Cream and Creamery Co., which applied for a receivership here last October. November fourth was fixed as date for closing up estate.

Shreveport, La.—The organization of an extensive dairy, creamery and ice cream business is in progress by the Northeastern Louisiana Milk and Cream Co. comprised of West Carrol and Richland county farmers and business men, and a few farmers of the northeastern part of Ouachita county.

Holland, Mich.—Announcement is made of the purchase, on July 8th, by the Arctic Ice Cream Co., of Detroit, of the Wagnaar-Hamm Cream Co., Ninth St., this city.

Lansing, Mich.—Hunter Dairy Co. have gone into the ice cream manufacturing business.

Minneapolis, Minn.—A plan to erect a building this fall for the manufacture of ice cream to supply the retail druggists of Minneapolis for their retail trade, is under way, according to George A. Ball, proprietor of the Ball Pharmacy Co. ,1942 Hennepin Ave.

Vicksburg, Miss.—S. N. Sutton of the National Ice Cream Co., announces that he will install an ice making refrigeration plant this fall.

Kansas City, Mo.—Plant of the Excelsior Ice Cream Cone Co. burned down July 4.

Kansas City, Mo.—The Peerless Ice Cream Co. has opened up a new factory at 319-21-23-25 East 31st St.

Mexico, Mo.—Hassen Bros., of Mexico, have completed plans for the erection of an up-to-date creamery and ice cream factory on lot across street from Orpheum Theater. Plant is capable of manufacturing 500 gallons of ice cream daily.

Springfield, Mo.—A $250,000 creamery will be established in Springfield by members of the Southwest Missouri farm clubs.

Sedalia, Mo.—The Tullis Ice Cream company filed articles of association in the county recorder's office recently. Capital $200,000. W. V. Tullis, J. W. Bagby, and M. Hall, incorporators.

Excelsior Springs, Mo.—Arthur Vail, who has been employed by the Excelsior Springs Ice Cream and Milk Co., has taken over the milk business of the concern and will be in charge of same from this date.

St. Louis, Mo.—Grafeman McIntosh Ice Cream Co., chartered with capital stock of $10,000. E. D. Ruth, Jr., 102 N. 8th St., St. Louis, Mo., is interested.

Bryan, O.—Essi and Khourig have installed a York refrigerating machine in their ice cream plant.

Coshocton, O.—The Supreme Ice Cream Co. will build a new cement block building 50x75 feet, two stories, for their ice cream plant, and will then add new equipment consisting of viscolizer or homogenizer, pasteurizer, ten-ton refrigerating outfit and other necessary outfit.

Coshocton, O.—Connor Bros. Ic eCream Co. will make some improvements in their plant for next season.

Defiance, O.—The Defiance Ice Cream Co. reports that their ice cream business is so large that they will be obliged to enlarge their cold storage room and add more space to their plant to take care of their business next season.

Findlay, O.—The Findlay Dairy Co. is reported as doing a fine ice cream business. Sam Gill from Toledo, O., has taken the management of their ice cream department and he knows how to make the cream that can please the public.

Galion, O.—Paul Wilson has opened up a new ice cream plant and is reported as doing fine. In the fall he will move into his own building and will then install refrigeration machine and storage room. Mr. Hubely is the ice cream maker. The local boys are all glad to know that Mr. Hubley is back in the business at Galion.

Loudonville, O.—Wm. Gretzinger, of Loudonville, O., has put in an ice cream plant and also a refrigeration outfit.

Massillon, O.—Davis Bros. have built a new concrete building for their ice cream business.

Newark, O.—J. V. Mast has added a new ice cream freezer and enlarged his cold storage room in his ice cream plant.

Muskogee, Okla.—Muskogee Ice Cream Co. chartered with capital of $50,000 by C. P. Gotwals, C. E. Shannon, Mrs. L. F. Austin.

Pawhuska, Okla.—Pawhuska's new $10,000 ice cream plant has opened for business. It has capacity of 400 gallons. The owners are W. M. Gibson and W. D. Lamb of Wagoner.

Ord, Nebr.—Lester Bly is making preparations to start a new ice cream factory at Ord.

Connellsville, Pa.—The Yough Crystal ice plant has been purchased by F. C. Rose and A. L. Rose, owners of the Rose Ice Cream Co. They will convert it into a modern ice cream plant.

Charleroi, Pa.—The Wagner Ice Cream Co., is planning on building an ice plant this fall, according to announcement by one of the officers.

Glenside, Pa.—The Penn Ice Cream Co., a newly organized concern has just entered the field here. The proprietor are Messrs. Justice and Hardy.

Lancaster—The Lancaster Sanitary Milk Co. are making a large extension to their present plant. Additional property has been acquired and the McCormick Co., Inc., are planning a three-story reinforced concrete building that will contain the ice cream plant proper, power plant and ice manufacturing department, all separate from their present building.

Philadelphia, Pa.—The Colonial Ice Cream Company has purchased the plant of the Scott-Powell Company, 48th street and Westminster Avenue.

Scranton, Pa.—Smith & Clark Co., receiving bids for the construction of their new three-story and basement, 60x100-ft. ice cream plant, to be located at Wyoming & Poplar streets. Plans prepared by the McCormick Co., Inc., Pittsburgh and New York City.

Stroudsburg, Pa.—Taylor & Dreher, ice cream manufacturers, it is reported, will build a new plant this fall.

Wilkes-Barre, Pa.—M. F. Fadden & Sons, Inc., Scranton, Pa., will abandon the present sub-station at Wilkes-Barre and erect a new ice cream plant at Kingston, Pa., across the river from Scranton. The building as planned by the McCormick Co., Inc., will be 60x90 feet, two stories and half basement, located at Wyoming Ave. and Lehigh Valley railroad.

Memphis, Tenn.—The Dixie Ice Cream Company, with a capitalization of $100,000 has been organized by Wm. P. Metcalf, a Memphis attorney. The company announces plans for erecting a modern ice cream and dairy products plant at Union Avenue and the Southern Railway tracks, to have a capacity of 500,000 gallons annually.

Houston, Tex. — The United Food Products Co., 307 Washington Ave., has just lately engaged in the manufacture of rice ice cream.

Terrell, Tex.—The Frick Ice Cream Co. of Corsicana, is opening a branch plant at Terrell. It will be in charge of R. H. Bennett of Ada, Okla.

Fairmont, W. Va.—A certificate of incorporation of the Robinson Ice Cream Co., has been filed with the secretary of state. The capital stock is $10,000 and the incorporators are: Frank R. Braham, F. Braham, H. J. Ross, W. J. Boydston and Charles Holland.

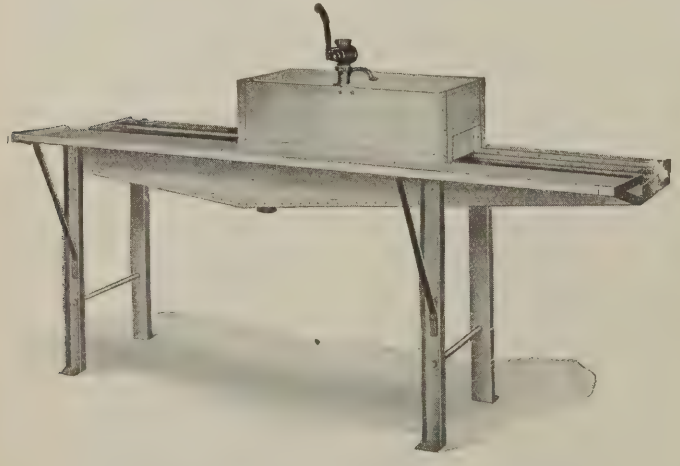
BACK THEIR FAITH BY THEIR DEEDS.

No one who witnessed the great exhibit staged by The Creamery Package Mfg. Company at the 1920 National Dairy Show can doubt that that company is a firm believer in the value of the show to the dairy industry. This faith is emphasized when they take all the space the show management would allot them for the 1921 show—a space comprising some 5544 sq. ft.

The company announces that their 1921 exhibit will surpass all of their previous exhibits as regards beautiful appearance, variety of machines exhibited and assortment of new equipment which will make its first appearance at the 1921 Show.

The extra efforts which The Creamery Package Mfg. Company will extend for the 1921 National Dairy Show are inspired by the confidence they have that the forthcoming show is going to be the most wonderful exposition the dairy industry has thus far staged. The great Northwest is unquestionably a huge new Empire of Dairyland; the businessmen of the Northwest are behind the show to a man and will undoubtedly give visitors the time of their lives, and the many conventions to be held during the show by dairy interests, as well as the varied attractions of the show itself will certainly result in the greatest attendance that the National Dairy Show has thus far secured.



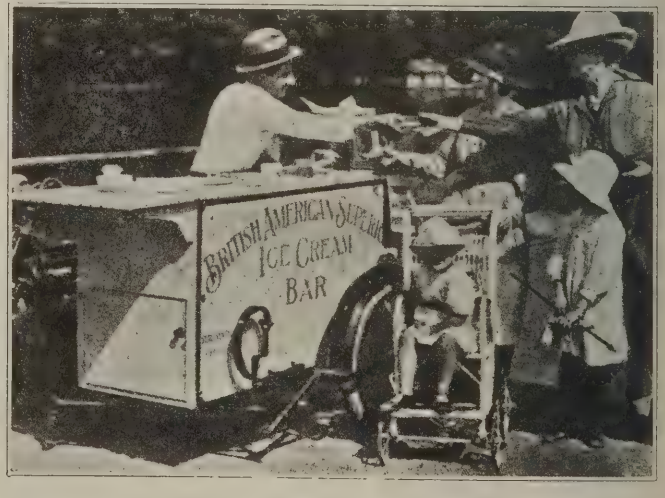
The Large Creamery Package Exhibit at the 1920 National Dairy Show.

A NEW MACHINE AT THE DAIRY SHOW.

One of the latest machines on the market for the ice cream manufacturer is The Luick Ice Cream Brick Mold Releaser, manufactured by The Creamery Package Mfg. Company. This machine was designed by a leading ice cream manufacturer to handle ice cream bricks in a more sanitary manner and to deliver a brick from the mold in better shape.

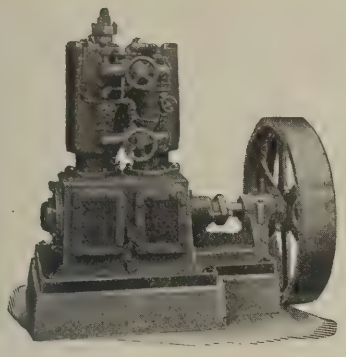
No power is required to operate The Luick Ice Cream Brick Mold Releaser. The use of this machine avoids the necessity of dipping molds in tanks or tubs of water which soon become dirty and insanitary. The Releaser delivers the brick from the mold in a solid brick instead of one that is soft and mushy on the sides.

The Luick Ice Cream Brick Mold Releaser.



The Luick Ice Cream Brick Mold Releaser is built entirely of metal and is heavily galvanized. It is simple in construction. It has a catch pan which can be connected to floor drain or sewer, also has steel workshelf with space on each end for draining the molds after thhe brick is removed. Nothing to get out of order and will last indefinitely.

The mold is placed in the machine and first receives a spray of cold, clear, fresh water which thoroughly washes off the dirt from the outside of the mold. Then every part of the mold is sprayed with hot water. The operator simply turns a quick-operating whistle valve for one or two seconds prior to releasing the brick. The machine can either be connected to hot and cold water supply respectively or to steam and hot water connections.

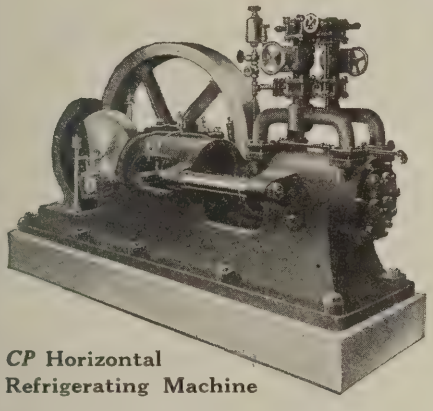


⚜

MEETING AN URGENT DEMAND.

The hot dry weather which England has been experiencing has been more than welcome to the vendors

of ice cream. Here is one of the trade who has risen to the occasion by mounting his stall on a motor-cycle side-car. He is to be seen at a popular Thames resort. —Clipped from London Times.

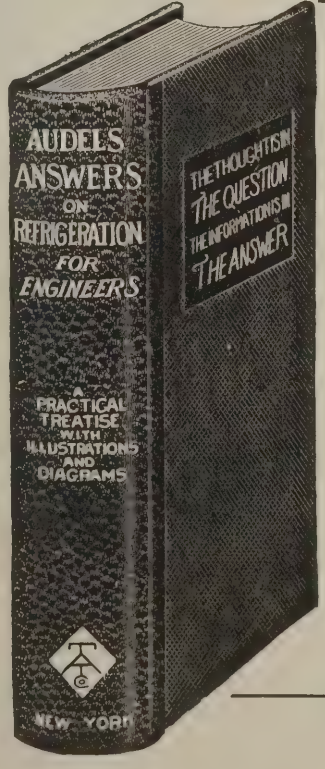


CP Vertical
Refrigerating Machine

Pays for Itself in 3 Years

Then Pays Dividends!

ALTHOUGH the greatest benefits that accrue from a ***CP*** Refrigerating System to its owner are the freedom from dependence on the ice man, the convenience of the system, the steady, dry temperature and the cleanliness of the ***CP*** System, it is a fact that will be vouched for by any owner of a ***CP*** System, that the savings it effects by eliminating the ice bill alone will pay completely for the outfit in three years or less. From that time on your expenses for refrigeration will be the smallest single expense you have.



CP Horizontal
Refrigerating Machine

CP Refrigerating Systems are made Vertical or Horizontal as desired in a complete variety of sizes ranging from 3-4 ton up. ***CP*** Refrigeration machines have several features which make them peculiarly well suited to the refrigeration of dairy products which are fully explained in booklet, "The Story of Refrigeration." Its yours for the asking. Send for it.

THE OLSEN PUBLISHING CO., 210 Sycamore St., Milwaukee

A. H. BARBER CREAMERY SUPPLY COMPANY ESTABLISHES TWIN CITY BRANCH.

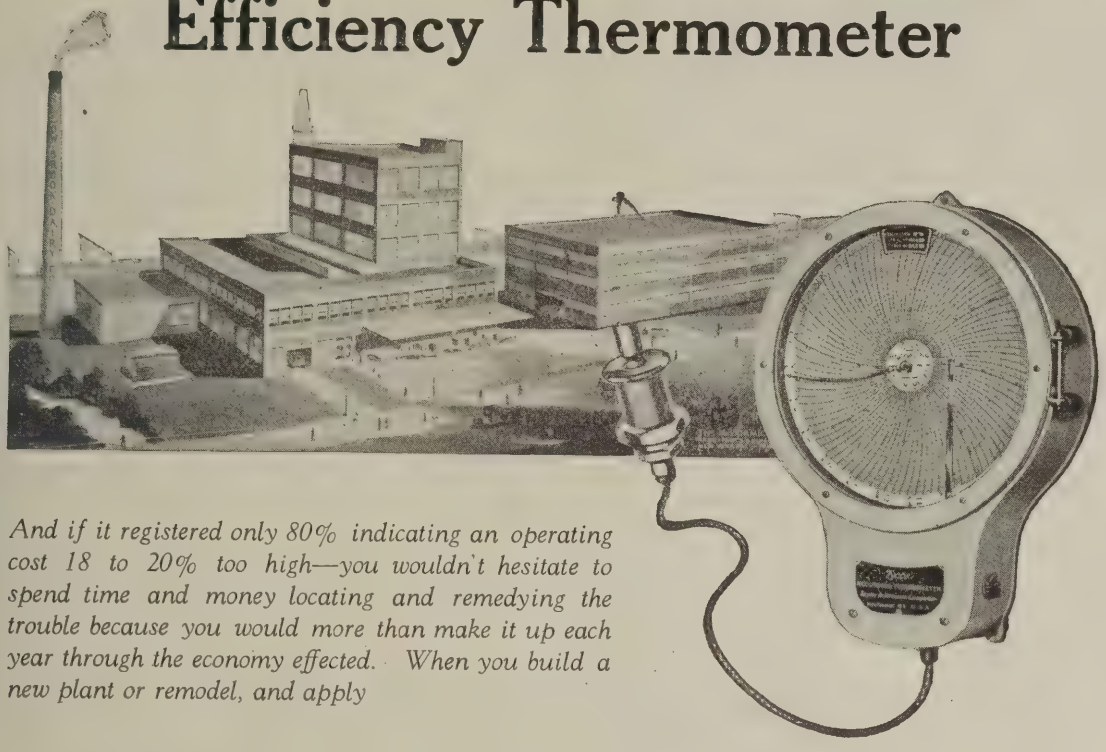
It will be good news to the hundreds of concerns in Minnesota and the Northwest, who for many years have depended upon the A. H. Barber Creamery Supply Company for their equipment and supplies, that this well known establishment has opened a Twin City branch.

This represents a real service to Barber patrons, because the new branch will have ample warehouse capacity and will carry a substantial stock of equip-

ment and supplies for prompt delivery, at lower delivery costs.

The A. H. Barber Creamery Supply Co. has enjoyed a large business in the Northwest for many years—a business that has grown to greater proportions during the past few years under the capable management of Jos. Grostephan, who is the manager of the new branch office and will have a corps of capable assistants with him.

The Twin City office is centrally located at 2490-2494 University Ave., St. Paul—in the Midway District, equi-distant from the centers of the two cities. University Ave. is the main highway, both for street car and automobile traffic, between Minneapolis and St. Paul—very convenient to hte business center of either city. Visitors to Minneapolis and St. Paul are cordially invited to visit the Barber offices and wareroom.



A DISCRIMINTING SPIDER.

When Mark Twain was doing journalistic work in San Francisco, a subscriber wrote and said he had found a spider in his paper, and he wanted to know whether this was good luck or bad.

Mark Twain answered in the correspondent's column. He said:

"Old Subscriber: Finding a spider in your paper was neither good luck nor bad luck for you. The spider was merely looking over the paper to see what merchant is not advertising, so that he can go to that man's establishment, spin a web across the door, and lead a life of undisturbed peace forever after."—Philadelphia Bulletin.

If Your Plant Were Attached to an Efficiency Thermometer

And if it registered only 80% indicating an operating cost 18 to 20% too high—you wouldn't hesitate to spend time and money locating and remedying the trouble because you would more than make it up each year through the economy effected. When you build a new plant or remodel, and apply

McCormick ARCHITECTURAL AND ENGINEERING *Service*

you are taking the maximum precaution against building deficiencies into your plant which are bound to run operating costs up and hold production volume down.

It is a highly-developed and skilfully applied service which concentrates intensively upon your own peculiar conditions and problems and leaves nothing to speculation or chance.

Our long experience of successfully solving ice cream and dairy plant problems is an important element of McCormick Service which should be considered. It is a well known fact that efficiency in McCORMICK SERVICE plants registers high and that the cost of the service is more than made up each year by the numerous construction and operative economies effected by its application.

It may be to your advantage to confer with us before going ahead with your work. There's no obligation whatever in discussing your problems with us, either by mail or personal conference.

THIS YEAR'S A TEN-SPOT FOR CHRIS.

I have attended every dairy show for the past ten years and would not miss one for ten times what it costs me to attend, and anyone connected with the dairy industry cannot and should not fail to be there, that is, if they want to keep up with the improved machinery and the up-to-the-minute methods.

This year the National Ice Cream Manufacturers' Association is also going to hold their convention at St. Paul, where a good many pointers can be gathered up, as some of the largest manufacturers will be there. If you go there and do not get what you want, you can blame no one but yourself, as there will be booths full of everything used, no matter in what branch of the dairy industry you are interested.

You should certainly give your support to these firms, for, if they had not spent their time and money, you would still make ice cream and handle dairy products in the old and expensive way. Even if you don't need a thing, go there and support these shows. Who can tell,—you may see something that will save you many dollars in operating your business for 1922. Get your competitors to attend also, as the old saying—"The More the Merrier"—and the better the show will be. CHRIS. T. HOLLINGER.

* * *

SIDEBOTTOM, JR., PICKS A BRIDE.

Have been through the sunny South this past month and find that while most of the ice cream men are complaining regarding business conditions, that actually they are doing a good business, although not to the same volume as last year. August will show a poor month on account of the abundance of low priced fruit which materially reduced the consumption of ice cream. However, everything looks healthy and the writer finds a great deal of enthusiasm regarding the Southern Association Convention in Atlanta, the end of November, in connection with the exhibition conducted by the Association of Ice Cream Supply Men.

From indications it would seem that the Dixie Flyers are spreading the news, and incidentally we are hearing awful good reports from the North Carolina Association. We expect they will join with us.

The president of the Dixie Flyers has been in the Texas territory and he advises that the indications there are that many of the ice cream manufacturers will journey to Atlanta and join with us and we surely will welcome them if they come.

We just heard that W. M. Sidebottom, Jr., of the Sidebottom Ice Cream Co., of Nashville, has tied a knot with his tongue that he cannot undo with his teeth. The Dixie Flyers extend to Mr. Sidebottom and the bride their congratulations.

J. W. Clopton, Secretary of the Southern Ice Cream Association, is one of these busy-bodies who find time to run his ice cream plant, the secretary's work, and also a quantity of civic work, and yet he doesn't really kick when the boys take up his time telling him about what is going on in the South. J. W. is sure some worker.

J. J. S.

A BOND GUARANTEE.

Mr. A. E. Dixon, vice-president and general manager of the Carolina Ice Cream Company, Fayetteville, N. C., during working hours, and secretary of the North Carolina Association of Ice Cream Manufacturers when he ought to be sleeping, tells us that he is meeting with success in a plan for guaranteeing the quality of the cream by the manufacturer.

He furnishes the retailer with a bond guarantee setting forth certain facts relative to the product, and assumes all responsibility for its quality. Mr. Nixon reports that the plan has "fulfilled our expectations."

"COME ON, BOYS."

When the leaves start to fall and the mornings
get cool,
And the kids begin dreading to go back to school,
Then you'll hear a faint whisper stir in the
fall air,
Of the conventions east, in the west, everywhere.

All the ice cream men begin to perk up their
ears,
Forget all their worries, their troubles and fears,
Go buy a new suit, a new hat and a tie,
Pack up the old bag, kiss the family "good-bye."

Off to the convention in that western state—
Let us hope that the dog-gone old train won't
be late—
There we'll hear of the latest inventions and
things:
How to sell cream by tons; tie up bricks without strings.

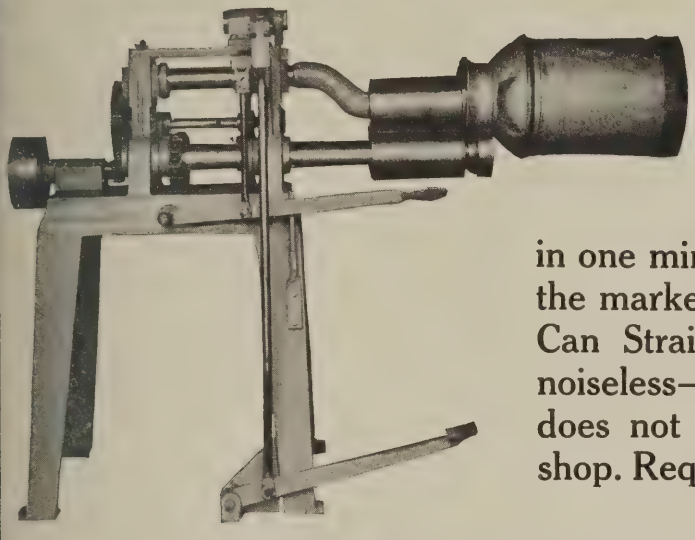
All of the proceedings are so interesting
(And gee, don't you tell, but that ain't everything);
There's the good looking ladies who visit the
show,
And a spread that is fit for the nobles, I know.

A trip through the city, on the "go" without rest,
The Ice Cream Men's Convention's a howling
success.
Home with clear, broadened vision, the problems all solved,
Thrice paid for the time and the money involved.

* * *

Am I going? You bet! Why, I'd not miss the
treat
For a new Cadillac with a gold covered seat.
Gee whiz, look at that clock; train time's coming round,
Here, give me my hat—I am "Convention"
bound.

—By "Poetess Laureate" of the North Carolina Ice Cream Mnfrs. Assn.



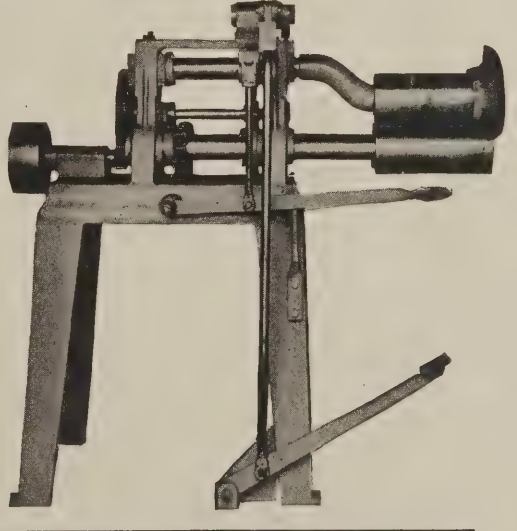
DEATH OF MRS. FRANK B. STUART.

The Dixie Flyers all extend their condolences to Mr. Frank B. Stuart, of the Sani-Seal Ice Cream Co., Knoxville, Tenn. Mrs. Stuart died on July 29th, and the many friends of Mr. Stuart express sympathy for him in his sorrow.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad. for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

Save Your Cans with a "WACHO"

Can Straightener



Does the work at an your own plant at an insignificant cost per can. Cans completely straightened in one minute. There is no other machine on the market that does the work of the "Wacho" Can Straightener. Its process is simple and noiseless—a practical little rolling mill that does not make your plant a miniature boiler shop. Requires only one horsepower to operate.

The First Hundred Cans Straightened Pay for the Machine

Straight cans hold full measure—Can be kept cleaner—Last longer—Make washing easier —Prolong the life of brushes on your can washer—Easier to repair—Straight cans with tight-fitting covers avoid loss of milk by splashing.

See this machine in operation at the National Dairy Show, October 8-15th —Booths 301-302

c/o Creamery Package
Mfg. Co., Detroit.

BOOSTERS.

The Hunter Dairy Company, Lansing, Mich., has discontinued their ice cream department in the city of Lansing, and will operate the milk business from the farm.

John A. Davis, manager of the Michigan Ice Cream Company of Lansing, Michigan, is taking an extended vacation.

The Freeman Dairy Company, of Flint, Michigan, suffered considerable loss by fire in their horse barn. The horses were all saved but the hay on an upper floor was destroyed.

The Wilson Ice Cream Company of Port Huron, refrigeration department to include ice making. Leroy Wilson is the manager of the company.

Carlisle Ice Cream Co., Port Huron, Michigan, will erect a new building for next season. The plans have been drawn for a modern two story plant.

The Parker Dairy Company of Saginaw, Mich., is adding a butter department to the ice cream and milk business. The company has bought a new churn and pasteurizer. They expect to be operating by Sept. 15.

The Connor Ice Cream Company, of Owosso, Mich., is installing refrigeration and storage departments in the Imlay City, Mich., creamery, to handle ice cream from the main factory at Owosso, for re-shipment.

The Milk Producers' Company of Battle Creek, Mich., has installed a new separator to take care of an unusual over-supply of milk in that territory.

Michigan is surely well supplied with auto bus and truck lines for passenger and freight business. Whether this proves to be a permanent transportation system remains to be seen. Lines out of Detroit to suburban towns include to points such as Mt. Clemens, Pontiac, Ypsilanti and Ann Arbor, competing with electric interurban lines. The freight truck line gives hourly service and the passenger auto line gives service each two hours. They are now operating between Detroit and Lansing and Grand Rapids, making all towns on the Pere Marquette railroad.

The next convention of the Michigan Allied Dairy Association at Saginaw, Michigan, which will probably be February 14-17, 1922, will be held in the auditorium and it is expected to have a large machinery and supply exhibit, also, an exhibit of some 25 head of cattle, demonstrations and milking tests. The committee promises "The Biggest Show Ever in Michigan." Boosters get in line and secure space reservations early. Mr. H. D. Wendt, Director Bureau of Dairying in Michigan Department of Agriculture, and also Secretary of the Michigan Allied Dairymen's Association, is in charge. His address is Room 376, Capitol National Bank Building, Lansing, Michigan.

BOOSTER ROOTER.

Both Mr. and Mrs. E. C. Robbin of Marion, O., hav passed away. Their death occurred about six weeks apart They were in the ice cream and confectionery business.

Joe Dumit, Upper Sandusky, O., has installed a new soda fountain in his retail store.

The Michigan Allied Dairy Association held their quarterly meeting at Bay City, Mich., on the 18th of August. In connection with a picnic dinner at the beach, games were played and a good time was had by all.

The Michigan Allied Dairy Association will hold their next convention and show of exhibits at Saginaw, Mich., on February 14-17, 1922, in the Municipal Auditorium building.

The Dairy Products Co., Bucyrus, O., is building a new brick addition to their plant.

The Ashland Sanitary Co., Ashland, O., will soon let the contract for a new two-story brick building for their dairy and ice cream business.

The Dickson Creamery Co., of Mansfield, O., has purchased the Electropure Dairy Plant from the receiver. They will, no doubt, make it go as they are financed to do so. Mr. Swaney will be manager for the new company.

Floyd Schulenberg, Lima, O., died Wednesday morning, August 10th, after a few days' illness. He was employed by the White Mountain Dairy Co. as a freezer man and was well liked by all and will be sadly missed.

Joe. Huhn of Van Wert, O., will install a new soda fountain in his retail store and will also install an emulsor. He will soon move into his new location.

Warren S. Gravett has been appointed receiver for the Quilling Brock Co., Piqua, O., who operated a creamery and ice plant here.

The Standard Creamery Co. of Van Wert, O., has purchased an emulsor and will install same at once.

Chas. Hankish, Bluffton, O., will add improvements to his plant next season.

Fishers Purity Dairy Co., Wapakoneta, O., is building a new addition to the plant.

A new firm known as Brown & Gleason are manufacturing ice cream.

The B. & B. Ice Cream Co. of Piqua, O., report a good business this season.

Hughes Dairy Co., of Bowling Green, O., has started the new ice plant and will now be able to take care of the business in good shape. They will soon start to build a new addition for the ice cream department, also a new room for bottling milk. They have bought an emulsifier.

Ravenna Milk & Ice Co., Ravenna, O., are doing a fine business and the public is well pleased with their ice cream and ices. This firm is making the best which can be made and using the best that money can buy.—C. J. Y.

FIGURE IT ALL IN.

The business executive who is considering the purchase of electric trucks for delivery purposes, in comparing horse-delivery costs with electric delivery costs, must figure in everything if he is going to do justice to himself and to the electric.

Here are the items of expense in maintaining a horse-delivery system, as compiled by one who has given a great deal of study to the question:

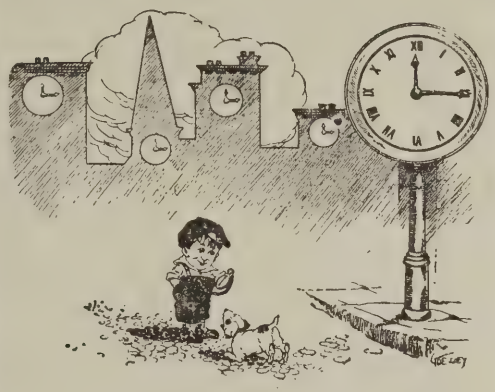
The investment in land, in stables, wagon sheds, harness rooms, hay loft, etc.

The investment in horses, wagons and harness, taking into consideration that the average life of horses in delivery services is 5 years (only 4 years in very big cities).

The interest on investment and the up-keep and depreciation on the buildings.

The replacement cost of horses.

The up-keep and depreciation on wagons, harness, etc.



The number of days the horse is sick or resting.

The number of miles he can and cannot travel.

The loads he can and cannot haul.

The cost of feed, bedding, shoeing and care (for the horse eats and has to be looked after whether he works or not).

The number of extra horses required to take care of the extreme heat of summer and blizzards of winter, sickness.

NOW'S the time a lot of plant operators should realize that by barking about the bargains in used equipment they have stored at their plants they can wake up a good many buyers thru our "Want Department."

Thanks

SOMETIMES during the rush of the busy season we overlook items of importance, calling them "details"—

The enthusiastic reception and general use of the "Survitor" offered to you in the midst of the season prompts this word of appreciation.

Certainly the ice cream manufacturers were not slow to recognize in the "Survitor" a legitmate sales promoting idea of considerable value.

WHO CAN HELP?

We have received the following letter from a reader who is looking for help in solving a manufacturing problem. Who can tell him what the trouble is? Please write us. Here is the problem:

Editor, Ice Cream Review:

Gentlemen: Having tried for some time to get some information without success, we are writing direct to you in the hope that you can refer this letter to some firm, capable of answering it correctly. While the writer is not exactly a novice in the ice cream business, having a couple of college degrees and several years' experience in different plants, so far we have been unable to successfully cope with this situation.

Our mix contains 10 per cent butterfat and 35 per cent total solids, with .7 per cent gelatine and 12 per cent sugar. It is pasteurized and the whole mix run through the emulsor, cooled to below 50 degrees, and aged over night. After freezing, the cream is poured into five gallon cans and hardened in large boxes with ice and salt, as we have not yet got in refrigeration. We find the cream—over half of it—to be "icy," that is, having formed long, thin crystals, especially around the edges of the can for about two inches toward the center. In addition to this, once in a while there is a can in which the sugar seems to have run to the bottom, forming a syrupy mass which becomes very hard and icy, and which occupies about three or four inches in the bottom of the can. These are our only troubles with the cream, and even when icy it has a good, smooth, creamy taste, is not granular, sandy, watery or in other ways off quality. We have gone thoroughly into the proportions of the mix, and are positive that nothing is wrong up to time of hardening, as it is thoroughly mixed and emulsified, also freezer is working properly. We have bene of the opinion that too slow or too fast hardening, due to ununiformity of hardening with ice, is the cause, also fact that cream often becomes soft during day while waiting for ice, etc., and is then repacked and rehardened. However, after doing our best to rectify such conditions, we are still having the same trouble, and we are very anxious to straighten things out. We have written and consulted several salesmen supposed to be "experts" in such matters, without avail, receiving almost exactly opposite suggestions in many cases. If you can give us any help in this connection we will appreciate the favor greatly.

Thanking you in advance for anything you can do for us, we are, Yours very truly,

——— ICE CREAM CO.

ELECTRIC WELD PICNIC SEPT. 10.

About a thousand employes and friends of the John Wood Manufacturing Co., Conshohocken, Pa., attended the annual picnic of the company at Augustine Beach, on the Delaware Bay. Transportation was furnished by the John Wood Co., the river steamer Thomas Clyde, having been engaged for their own use for that day. A picture and story of the picnic will appear in the October number.

WEST VIRGINIA MEETING NOV. 21-22.

C. F. Jamison, Secretary of the West Virginia Association of Ice Cream Manufacturers, reports to The Ice Cream Review that the next annual convention of the Association will be held November 21 and 22, at Wheeling.

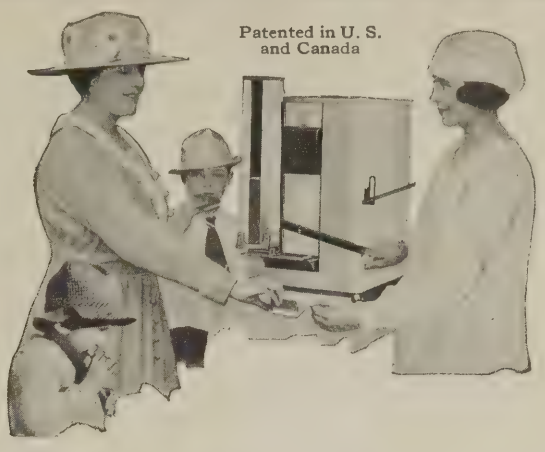
If women were as susceptible to flattery as men they would all go crazy, because they get so much of it.

AN IMPORTANT DECISION.

An important decision has been handed down by the Inter-State Commerce Commission affecting express charges on ice cream shipments. In a complaint submitted by a manufacturer of dry containers, the Inter-State Commerce Commission was asked to require the American Railway Express Company to make certain changes in basing their charges for express shipments.

In this complaint it was shown that ice cream is now shipped almost exclusively in tubs, pails or barrels, packed in ice. In computing express charges on ice cream thus packed, a deduction of 25 per cent of the estimated gross weight is made. Where shipments of ice cream are made in dry containers, the charges are assessed on the actual weight. The complaint alleged that because of this difference in the methods of determining the charges, the manufacturer and shipper of the dry container are subjected to the payment of rates which are unreasonable and discriminatory.

"The Inter-State Commerce Commission was asked to require the express company to establish a billing weight on the dry container and dry contents in proportion with the billing on the wet container and wet contents. In its decision, the Commission, requires that the express company shall change their practice on or before November 12, 1921, and "thereafter to abstain from its practice of billing shipments of ice cream in five gallon dry containers at actual weight, while contemporaneously billing shipments of ice cream in five gallon wet containers at an estimated or billing weight less than actual weight."



The Express Company will be required to base its charges on shipments of ice cream in five gallon dry containers on a weight "which shall not be a greater percent of the actual weight of such shipments than the estimated or billing weight now applied to shipments of ice cream in five gallon wet containers is of the actual weight of the shipments in wet containers, that is, an estimated or billing weight equal to 75 per cent of the gross actual weight of such shipments in dry containers."

STATE WIDE ADVERTISING.

This organization is greatly interested in the campaign to advertise dairy products in Indiana this coming fall and winter, beginning the middle of September. The Extension Department of Purdue is engineering the proposition and Mr. John Wann is in charge. Mr. Wann is a capable young man and will inspire your confidence. A portion of the Creamery License Fund was voted by the Creamery License Board for the purpose of financing the scheme. All organizations in the various counties, such as the Rotary, Kiwanis, Lions, Optimists, Civic, Educational, etc., will lend their assistance. Lectures in the schools and before various other bodies are a part of the scheme; window displays and other kinds of publicity. It is not easy to estimate the value of such an advertising campaign. Many cities and towns will have this opportunity of asssting in this campaign to educate the public as to the value of dairy products.

A. P. HOLLY,
Gen. Sec'y Indiana Manufacturers of Dairy Products.

The reason why so many brides blush is because in their innermost consciousness they feel ashamed of having married such a silly man.

Serve the Crowds

THE "SANISCO" WAY

Speed, accuracy, uniformity, service—these are the underlying principles on which the "Sanisco" Ice Cream Sandwich Machine is constructed. Every stroke on the lever of the "Sanisco" delivers a uniform slice of ice cream on a wafer. No loss of ice cream thru excess service or exposure. One operator with a "Sanisco" can do the work of 3 hand dippers.

50 Sanisco Machines Served the Crowds at the 1921 Wisconsin State Fair.

The ice cream sandwich appeals to both young and old. It eliminates the objection older folks have to "lapping" cones.

See the Sanisco Serve the Crowds at the National Dairy Show.

Let us tell you of some unique ways in which many Sanisco users employ this speedy ice cream server. Prices on request.

SANISCO CO. MILWAUKEE WISCONSIN

A Crowd Around a Sanisco Booth at the Wisconsin State Fair

The New Boedeker Plant in Dallas

ONE of the finest and most up-to-date ice cream plants in the southern states has recently been established by the Doedeker Manufacturing Co. at Dallas, Texas. This plant is the culmination of the ambitions of F. W. Boedeker, one of the first commercial ice cream manufacturers in Texas. Mr. Boedeker died last year leaving the business under the management of his son, George L. Boedeker.

The home of the Doedeker business is now housed in a two-story fire proof reinforced concrete building with brick facing and glazed Terra Cotta trimmings. The plant is located in the heart of the business and transportation section of the city, on the west side of South Ervay street. The use of a large amount of plate glass, gives the new plant a very pleasing appearance, together with plenty of light and ventilation.

The plant is located on the corner of Ervay street and Pocohontas, the main entrance being on Ervay. The office is a room 25x50 feet, and is located directly at the right of the entrance. In this space is located the general and private offices of the officers and the sales department.

At the left of the entrance is the power room. A battery of three 10x10 in. and one 7½x7½ in. York Enclosed Type Compressors, furnished by the York Engineering & Supply Company of Dallas, Texas, are located in this room. These compressors furnish all the refrigeration necessary for the freezing and hardening of the ice cream, and an ample supply of packing ice. Each of these machines is driven by an individual electric motor, which are cross connected so that any, or all of them may be operated on any unit of the plant. Three of these compressors have a capacity sufficient to take care of the present needs of the plant, one of them being reserved for emergency use. Ample space is provided in the power room for the addition of more equipment.

The boiler room is located under one corner of the power room in the basement. A well nearby furnishes water, the temperature of it, being about 65 degrees Fahrenheit. The freezing room is located directly in the rear of the office. White tile and white enamel tile cover the floor and walls of this department, respectively, the tiling on the walls being of a height of 5 feet; over this the wall is of Portland cement plaster. This is smooth and permits a very thorough washing of the entire room. This room is 22x33 feet in size and plenty of light is furnished by five large prism glass windows in the Pocohontas St. side.

The ceilings of all the rooms on the first floor are 22 feet high and are provided with 45 Luxifer prism glass transoms, each 3½x7 feet. These run the entire length of the room and side of the building. The rear of the building is provided with nineteen similar transoms. These provide a perfectly daylight plant. No artificial lights are used whatever, except in the refrigerating rooms.

The Boedeker plant is equipped with four Continental Direct Expansion Ammonia Freezers, with a

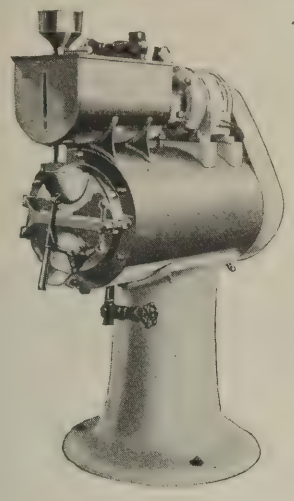
PULL, PUSH AND PROSPER!

Pittsburg, Kans., Sept. 1, 1921.

The Ice Cream Review:

It is my estimation, attending our national or state conventions, is advanced schooling for the ice cream manufacturer.

The day and age is now present when we cannot live by ourselves alone. Here is where we meet and learn from the leaders by mingling with them and our attendance helps to put us in the front rank or further to the front. Let's be with the leaders and help lead, not followers and be led.



By grasping new ideas and fitting them to our own needs and conditions in whatever way that they will do us the most good, may be the means of putting you on a line of advanced system which will be your line of success.

Let's pull, push and prosper through co-operation. We cannot co-operate by staying at home.

B. T. PERKINS, Secretary,
Kansas Assn. of Ice Cream Mnfrs.

Ample Space for Loading and Truck Storage.

ORIGINAL
CONTINENTAL
DIRECT EXPANSION
FREEZER

To be on exhibition at
National Dairy Show

The CONTINENTAL Way

ECONOMY should now be the principal thought of the ice cream manufacturer.

WASTE should be eliminated to keep pace with other readjustments.

OUR SYSTEM of freezing ice cream is the most economical as we use less refrigeration. This saves power.

OUR FREEZERS are ready to operate when the compressor starts. This saves time.

DIRECT EXPANSION means that the ammonia is expanded directly into the expansion chamber of the freezer with no intermediate losses. This means elimination of all auxiliary equipment. Hence saving in first cost.

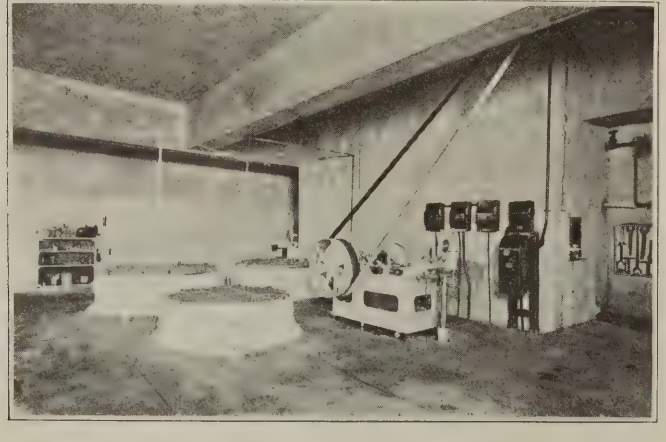
capacity of fifty quarts per hour. The tile floor under these freezers is raised ten inches, allowing the operator to empty them without stooping over. A Mojonnier Over Run Controller is part of the equipment of the freezing room as well as carbonic gas tanks with each freezer. This is part of the Heath Carbonated Process. All Boedeker ice cream is frozen with carbonated gas.



Ample water and steam connections are provided in the freezing room for the cleaning and sterilizing

The New House of Boedeker.

of machines. The mix gravitates from the holding tanks on the second floor directly to the freezer.

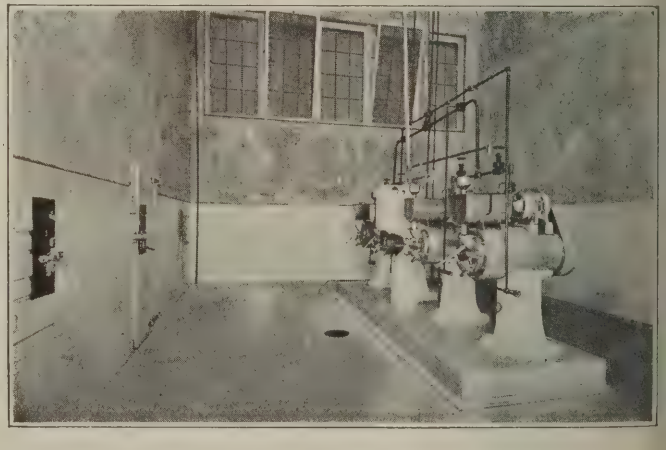
There are two hardening rooms. One arranged especially for brick ice cream and the other for bulk. These rooms open directly in the freezing room. Refrigeration is provided by the Direct Expansion Still Air system. Each room has a capacity of approximately 4,000 gallons of ice cream. The hardening rooms are so arranged that the intake is in the front directly opposite the freezer and the outlet cabinets

Homogenizing and Storage Room.

are in the rear, opening directly in to the shipping room.

In the center of the building is located the shipping room; this occupies about 50x75 feet. The building has a loading dock 75 feet long and is provided with an ice crusher in the center of the platform and is fed from the vault above. The ice gravitates through four 18-inch chutes to the delivery trucks, or to the platform, as desired. In this way the icing is done in about half the time required under the old system.

In one end of the shipping room is the special brick machine and wrapping room. At the other end is the can washing department. Here every can is thoroughly washed, rinsed and thoroughly sterilized with live steam.



Fifty feet of the rear of the first floor is lowered to provide a driveway approximately 50x75 feet. Plenty of room is provided here for the trucks to turn for loading at the dock. Also for night storage of all delivery equipment.

Office and Sales Department.

The electric elevator is located at the north end of the shipping room within a few feet of the dock. This is used for the elevation of all raw material to the second floor.

The second floor of the building contains the mixing room. This is 28x50 feet in size. Plenty of light in this room is provided, the entire one side being a row of large windows. A Pfaudler 500-gallon glass lined mixing vat and pasteurizer is part of the equipment, also two 1000-gallon Pfaudler glass lined holding vats. Homogenization is done with a 400-gallon

Freezing Room, Equipped With Four Continental Freezers.

Progress Homogenizer. A Mojonnier testing apparatus is part of of the mixing room. This being in one corner. A storage room for milk and cream and other supplies, opens directly into the mixing room.

The ice tank on the second floor has a capacity of five tons daily; space in this room has been reserved for another tank of the same size in case an expansion of the business is required. A large dry storage room is provided for tubs, cans, cabinets and other supplies. Locker rooms, shower baths, etc., are also located on the second floor. Th Boedeker plant was opened on

STOUT

Schroeder Perfection Cabinets

Insulation Is The Thing **upon which complete satisfaction depends**

Insulation is the outstanding quality of "perfection" in Stout-Schroeder Perfection Cabinets. It's the heart of Stout-Schroeder designing and workmanship—every detail conforms to this requirement and adds to its fulfillment.

Stout-Schroeder Perfection Tub Lined Cabinets

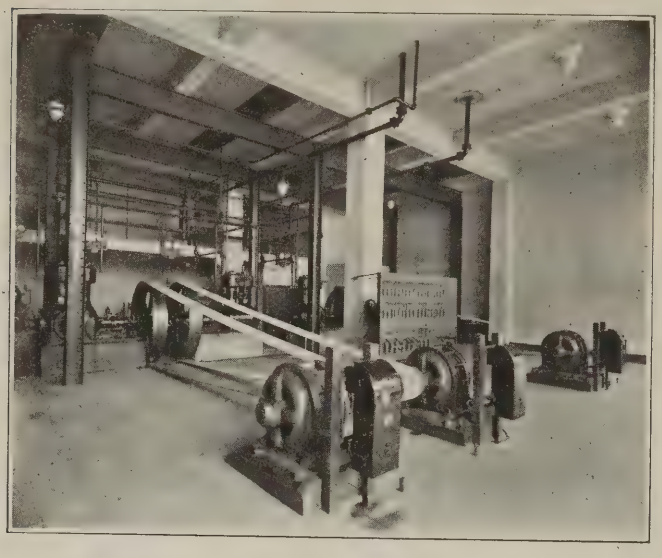
are insulated with fine regranulated cork, packed by our special process—it's the method of packing that really effects the "complete" insulation.

Our Standard 1200 Line

is the most serviceable for general use and is our "big volume" seller. Regularly finished in Golden Oak. Either "Tub" or "Metal" lined construction.

Stout-Schroeder Perfection Metal Lined Cabinets

are insulated with pure cork board "baked" to confine the air in the cells—it's the "baked-in air in the cells that conserves the "perfect" insulation values in the cork board.



The "Panel" (smooth surface) 600 Line

to meet the demands of trade to match other fixtures. Regularly finished in Mahogany—but other finishes will be furnished as specified. Either "Tub" or "Metal" lined construction.

Dallas' people have come to see one of the newest and finest plants in the South, in operation.

C. C. WINSLER OF LAWRENCE, KANS., HAS EXCITING EXPERIENCE WITH ROBBERS.

According to newspaper accounts C. C. Winsler, one of the proprietors of the Kaw Valley Creamery, manufacturers of ice cream and other dairy products, Lawrence, Kans., had an experience that he does not wish repeated:

Mr. Winsler had gone to the creamery to get a supply of cream for a customer. When he entered he noticed that a pilot light in front of the refrigerating room had been removed, and on going into the room, there was evidence of some disturbance of packages that had been left intact. He went into the refrigerating room to get ice with which to pack the cream, and as he came out he was walking backward, pulling the ice along the floor.

"I thought I saw the door move as I got close to it," said Mr. Winsler. "I looked up again and saw a revolver pointed in my direction. I made a grab for it with both hands and deflected the direction as the gun went off. Then another man told my assailant to beat me up. They struck me several times. I do not know what they used. It all happened quickly, but I noted that they were two white men, one tall and one short, and that they had handkerchiefs tied across the lower part of their faces. I was not wholly unconscious at any time, but do not know how the men got out."

When the robbers were gone Mr. Winsler got to the telephone, and called the police station. The officers scoured the neighborhood after they had heard the details, but were unable to locate a single clue.

Mr. Winsler was struck several times about the head; he remembers being hit four times. There were several bad cuts, and stitches were required for some of the wounds. He had left his watch at home when he started for the creamery, and as he fell when struck he fell on the pocket that contained his pocketbook. The only thing the robbers got from him was a bunch of keys. The creamery was not robbed.

The bullet from the revolver which was fired at Mr. Winsler was found in the wall of one of the creamery rooms the next morning. It was 32 caliber.

With this attempt on the creamery the plant has been burned twice, and robber efforts have been made three times.

THE INFLUENCE OF THE NATIONAL DAIRY SHOW.

On the Improvement of the Quality of Dairy Products, by A. H. Barber, President, A. H. Barber Creamery Supply Company, Chicago.

It is the writer's belief, that one of the out-standing benefits of the National Dairy Show has been the service which the show has rendered in aiding in the advancement that has been made in better quality, with the consequent stimulation in sales which has resulted.

It works in this way: for instance, an ice cream manufacturer visits the Dairy Show and National Convention. Upon leaving home he is quite self-satisfied with his own plant. He has had a successful season; has a substantial balance in the bank besides the outside investments that he has made.

Upon attending the sessions of the convention, he learns of greater successes made by other men because of better methods, better systems, better equipment. He visits the interesting machinery displays at the Dairy Show and immediately the imperfections of his own plant are visualized to him. Improved devices for can washing and drying, improved methods of handling mix and freezing are exhibited, and he realizes, as never before, the importance of improved epuipment in his plant.

As a result, he buys and improves his plant, improves his quality and thereby stimulates the consumption of ice cream in his town. No town has ever reached the limit of per capita consumption. Some towns are very much ahead of others. It is a significant fact that those towns having the greatest per capita consumption also have the honor of turning out the most uniformly high-quality ice cream.

By assembling the best known methods, the best machinery and the best of supplies, the Dairy Show contributes in this way, to no small extent, to the general improvement in quality of dairy products.

CONDENSED AND EVAPORATED MILK MARKET REPORT FOR AUGUST, 1921.

More Confident Tone Features Condensed and Evaporated Milk Markets—By United States Department of Agriculture, Bureau of Markets and Crop Estimates.

Markets for condensed and evaporated milk seem to have taken on a little more confident tone the past month. Conditions are still far from what manufacturers generally consider satisfactory, and here and there are individual firms who report no improvement, but the general feeling is apparently better, temporarily at least. Statistical reports received from manufacturers bear evidence of the fact that the situation has improved somewhat and that there has apparently been a healthier movement of most classes of goods.

The latest available figures as to total stocks in manufacturers' hands cover August 1, and reveal but a slight decrease under July 1. On July 1, however, the comparison with the previous month showed an increase in

Impruv-Mix

is a guaranteed pure-food product, made in paste form —containing 75% solids—completely soluble.

It may be used in a cold mix or may be added during pasteurization.

W. P. ABEL,
Manufacturer

Manufacturers, who bought IMPRUV-MIX, when first introduced at Atlantic City Convention in 1916, are still using this product because of the results (better Ice Cream—increased sales).

IMPRUV-MIX is equally effective when used with ripeners.

stocks on hand of about 25 per cent. The later figures are therefore more favorable from the manufacturers' standpoint, although they are partly due to a decreased production and not entirely to a more active movement of goods into trade channels. It will be noted, that on a comparative basis unsold stocks of all classes reported on August 1 were 114,000,000 lbs., as compared with 174,000,000 lbs. on July 1, or a decrease of 60,000,000 lbs., and that unfilled orders increased from 2,800,000 lbs. to 9,100,000 lbs. The movement was most active on evaporated case goods. July reports of evaporated milk exceeded 11,600,000 lbs., over half of which went to the United Kingdom and to Poland. Shipments to Germany dropped materially, but France and Belgium received over 1,200,000 lbs. Exports of condensed milk were some 2,000,000 lbs. less than the previous month and of the total amount approximating 5,700,000 lbs. Poland, with 832,000 lbs., the United Kingdom with 606,000 lbs., and Cuba with over 2,000,000 lbs., were the largest receivers. This total also included some 366,000 lbs. of condensed milk exported to Japan.

August prices paid producers for raw milk were higher in all sections, the average increase amounting to 28c per hundredweight. Greatest increases occurred in the northeastern sections, where it is reported that condensaries are accepting increasing amounts of milk. This is said to be responsible to some extent for a lighter production of cheese in those districts.

Manufacturers' selling prices as reported for July show that the greatest changes occurred in foreign prices. Condensed case goods were increased an average of 18c but evaporated goods were reduced 16c per case. Similar changes were made in domestic prices except for the amounts which averaged only 5c to 6c per case.

LARGE NEW CATALOG COMING FOR MILK DEALERS, ICE CREAM MAKERS AND CREAMERYMEN.

The Davis-Watkins Dairymen's Mfg. Co. announce that they are planning to issue their large New Catalog in book form about the first of January, 1922. In speaking about this a few days ago Mr. W. C. Davis, president of that organization, gave out the following information:

"Yes, we have decided to print it up in book form for the use of our thousands of customers who ought to have the information it contains handy for ready and quick reference.

"Perhaps you don't know it, but our advertising department has been working on this book for all they were worth during the last year. They started with some loose-leaf covers, and the catalog as issued at the time of the National Dairy Show last year. The result is something so good that we felt it ought to be put up in a shape so we could distribute it generally without too great a cost. It is sure to be the best piece of printed matter ever distributed in this line of business.

"It is made up in sections, with the machinery segregated under several classifications. Milk and ice cream cans, along with can washers are in the first section; milk bottle fillers and cappers have the second section; then comes pasteurization, bottle washers, churns, ice cream equipment, etc., in sections which follow. Our present idea is to bind these sections all together in one book; and then print our price sections in a supplement.

"We have no idea just how many copies to print, hence the advance announcement. The pages are all

in type, so it is going to be an easy matter to put them on the printing press and run off the desired quantity. We are anxious that every man who ought to have a copy of this book get his name and address into the hands of our General Advertising Department, Room 1212, 130 North Wells St., Chicago, Ill. This will enable us to make up our mailing list for the books.

"One important feature of this book is the many pictures of the machine, as actually in operation in plants. This is a thing every progressive man is interested in. It is rather difficult for men in our business to take the time to visit other plants, and we are going to make an effort to bring some of the far away plants right under his nose for study. This is very ably handled with photographs. A man in El Paso, Texas, can know just how the large plants in Chicago and New York are doing the same work he has to do in his plant."

It therefore behooves every one who is interested to make application now. Be sure to get your name on this list, for we have every reason to believe you are going to get a real catalog, worth a lot of study and investigation.

JACK RABBITS
ELWIN F. WEIL, Secretary
514 New York Life Bldg.,
Kansas City Missouri

EVAN HAS HIS OWN IDEA OF SNAPS.

Brother Jack Rabbits:—We wrote to several of you for snaps, pictures, of yourselves or your friends. Evan's car was stolen about that time and the poor fellow misinterpreted our request. He has a snap figured out to be something soft, like ice cream at the circus. May be we should have been more explicit and asked for snapshots. Evans has troubles, and he's not too bashful to tell about them either:

"I have a letter on my desk in which you ask me to send along a few snaps. If holding down two other men's jobs besides you own and then riding about ten miles in a street car every morning and evening, instead of driving your own car on account of some joy-riding girls smashing it up for you, is a snap, you may have as many as you want.

"This, however, just refers to my daylight operations. At night I am trying to help take care of a new grand-daughter, and I find this is no particular snap either.

"I note from your letter that you refer to Jim Mulligan. For your information will say that we had the pleasure of having 'Jim' around about us for the last week or ten days, telling us about the wonderful Caramala. Guess, however, that the heat drove him back as I had a letter from him yesterday stating that he is starting for Louisville to take his vacation. We can make it pretty hot for almost anybody down here, but 'Jim' has our invitation to come bock when he is through, and it has cooled off.

Believe that after this piece is duly censored you will have very little left for publication.

E. A. EVANS,
Vice-President, N. A. Kennedy Supply Company."

Charity extended on business principles is not charity at all, but merely a perfunctory performance by which hypocrites hope to fool their creator.

SODA MENUS
Ice Cream Manufacturers—Use Them to Advertise

OUR menus are popular among ice cream manufacturers who give them to druggists and confectioners with the manufacturer's trade-mark or advertising slogan printed on them. This is a sure and inexpensive means of advertising the ice cream manufacturer as the menus come to the attention of the customers of the retailer.

These menus are **especially** for the Soda Fountain. They are not hotel menus nor restaurant menus, but are printed and embossed in colors on the highest grade of stock and reproduced from original drawings for the use of Soda Fountains exclusively.

Samples Free on Request.

Ice Cream King Sees Future Empire of 5,000,000,000 Frozen Gallons

AT LAST an ice cream king—not of manufacture, but of consumption. At least no rival monarch yet has filed a counterclaim before any league of nutritions.

This ruler, by virtue of quantities, of ice cream eaters is Roy Tillinghast, a prominent amateur sportsman of New England and an extensive traveler. His home is in Providence and he is well known in sport circles in a number of states. He is a natural and experienced baseball player who, many professionals have said, could, if he chose, have entered the big leagues shortly after he left Brown university. He is a roller skating polo player, an expert skater and a hockey player. He alternates such sports as these, in proper season, with football and basket ball. He enjoys deep-sea fishing and has made some remarkable catches. He hunts through Rhode Island, the New England states north of there, and in Canada. He is a fine figure of an athlete, quick, alert, finely poised, and deft and sure in movement.

Roy Tillinghast, Ice Cream King.

And, he attributes, at least in some share, this athletic readiness and prowess to his eating a gallon of ice cream every week.

"I began it when I was a small boy," he says. "My father tried to discourage what he considered an inordinate appetite for ice cream by the same tactics with which small boys are cured of the smoking fever—by giving me so much of it that I would never want any more. But, instead of this working as he wished, it only made my appettie stronger, and I now eat ice cream at least three times a day, and often enter a ball game to pitch nine innings, after eating nothing more than two plates of ice cream. I really believe that much of my ability as a sportsman comes from the physical properties I have acquired through a constant use or ice cream.

"As a matter of fact, my average is probably more than a gallon a week, for I know that in the summer I eat possibly a little more of it than in the winter. But I do not at all consider ice cream merely a summer food, and in fact, cannot understand those persons who refuse to eat it in the winter. It is just as much a food winter as summer and to my mind just as palatable a delicacy also."

Roberts Everett, secretary-manager of the Association of Ice Cream Supply Men, who interviewed Mr. Tillinghast recently in New England, asked him: "Do you think that everyone should, or ever will, consume as much ice cream and consume it as regularly as you do?"

"I see no reason why everyone should not," Mr. Tillinghast told him. "It is good for children and adults both. I am convinced that its food properties are unexcelled and everyone knows that nothing could taste better. It will probably be some time before every person appreciates the merits of ice cream as I do, but when all ice cream made is really good ice cream, I believe the entire public may gradually come to like and value it to the extent of eating a gallon a week."

"If the ice cream industry ever realizes such a tremendous future as that," Mr. Everett said, after talking to Mr. Tillinghast, "there is no better time to start than today. Fortunately, most manufacturers are making good ice cream, but to make that good ice cream better or to make it more efficiently and profitably so as to provide each year an increasing margin of expenditure in educating the public taste to the point that Mr. Tillinghast has reached, advantage should be taken of every opportunity to study advanced methods and means of manufacture and distribution, such opportunities as are offered by the exhibitions to be held in Buffalo, Oct. 31 to Nov. 5 inclusive, and in Atlanta, November 28 to Dec. 2, inclusive, this year, in the service of the ice cream industry, in which every phase of manufacturers' needs will be featured, and by the conventions of the national and various state and sectional associations of ice cream manufacturers which will be held throughout the fall and winter."

Concerning the value of these large exhibitions of supplies, equipment and machinery, the two of which for 1921 will soon be held in Buffalo and Atlanta, the Association of Ice Cream Supply Men has received a letter from J. E. Dunn, president fo the Pacific Ice Cream Manufacturers' Association, and a manufacturer known not only in his home city of Portland, Ore., but, through his prominence in the National Association of Ice Cream Manufacturers, to men of the industry throughout the whole country, in which he characterizes the last exhibition of the supply men's association, which was held on the Pacific coast, as doing "more for the uplifting of the ice cream business than any other one factor that has occurred in many years."

"Does the ice cream industry benefit by the exhibitions of the Association of Ice Cream Supply Men?" writes Mr. Dunn in his letter. "Is the opportunity to see and learn all about the new ideas worth the effort required on the part of these men? When we can study the ingredients, machinery, binders and scientific instruction all under one roof, isn't it worth while?

"To have these assembled in a place where we can go to look upon them, where we can have the men who are versed in this business tell us the story of the machinery—the methods, the principles that are involved in the handling of new machines, or extracts or flavor, or

Ice Cream Men!

Here's the Can Truck that fills your needs

Note these features for easy handling, strength and long years of service—

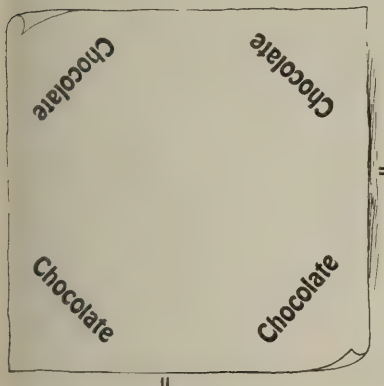
Ball bearing swivel casters at each end. Big, heavy 8-inch main wheels with flat faces to save wear on floors.

Wooden bars cover all bottom rails to fully protect cans from denting.

Rail all around top (optional equipment) forms a handy place to keep the covers.

No slop before washing—well drained after washing. Cans automatically counted.

A sturdy frame built of structural steel, well braced to stand every shock. Top cannot sag. This strong, rust proof, galvanized frame insures years of service.



Nutting Ice Cream Can Trucks were first made to order for a big ice cream plant. Compare these specifications with any other can truck on the market, **regardless of price.**

See the Nutting at the National Dairy Show or write us for prices. Ask also for Bulletin E, showing 300 designs of floor trucks for all purposes.

NUTTING TRUCK COMPANY, 1143 Division Street W., Fairbault, Minn.

K. V. P. "Indexed" Vegetable Parchment Can Tops

Avoid confusion in your hardening and storage rooms as you would in your office records. Filled cans in storage contain the definite record of a manufacturing process. You can

Systematize Your Hardening Room

with these handy K. V. P. "Indexed" can tops and do away with having employes fumble can covers to establish the identity of their contents.

Combination Sanitary Can Top and Can Label

Made of genuine vegetable parchment in the "World's Model Paper Mill." These K. V. P. "Indexed" can tops are absolutely sanitary. They protect the contents of your cans against contamination and reduce the necessity of washing lids.

Prominently printed on substantial vegetable parchment, these tops are not a flimsy article just for show or effect, but an honestly made, practical, sanitary can cover that is serviceable and supplies a great need at a very nominal cost.—Try Them.

So You May Know the super-excellence of K. V. P. Products, samples will gladly be sent on request.

binder, is an opportunity that should not be missed by any man in the business.

"The Association of Ice Cream Supply Men, with its Seal of Safety, has demonstrated to the satisfaction of every man on the coast the benefit of this remarkable institution. Its value to the trade cannot be estimated in dollars and cents. The good will that it has brought, the educational benefit derived from it, cannot be reckoned in the ordinary way.

"This association should be loyally supported by every ice cream manufacturer. He should look for the Seal of Safety when he is purchasing his goods, because it is the evidence of men who are upbuilding the business in an intelligent manner—men who have the interest of every manufacturer of ice cream at heart. Their Code of Ethics sets this out. These men are the missionaries—telling of the new-found ideas, showing the new machinery, the new methods of sanitation, the new principles of binders, the best of many flavors.

"When they assemble in their magnificent exhibitions, they give the people an opportunity to come, be entertained, and find a dazzling array of facts that have been gathered together, and machinery that has been brought for observation and study. People who come and so obtain first-hand all this information are fortunate indeed, and have this remarkable association to thank for it.

"I for one, want to express my appreciation of the Association of Ice Cream Supply Men for the work they have done in bringing to the Pacific Northwest the greatest educational exhibition that has ever been known, and that has done more for the uplifting of the ice cream business than any other one factor that has occurred in many years, because its presence is felt and will be felt for many years to come.

"Men whose business is a personally-conducted effort, who have been unable or unwilling to leave their places of business to see and learn of the advanced efforts in the industry, came, saw and learned.

"Let us hope that your good institution will continue to go on for the good it does and for the uplift of a great industry."

NORTH DAKOTA ICE CREAM MANUFACTURERS

Do not fail to plan to be on hand when the National Convention of Ice Cream Manufacturers convenes in the Twin Cities October 10th, 11th and 12th. Here is a chance to rub elbows with our competitors and with men who are making a success of their ice cream business. We all have something to learn in our own line of work, and this convention, which is being held in connection with the greatest Dairy Show in the world, is the place to get the information you want first hand.

The time and effort you spend will be worth while, so let's plan to go and take advantage of the good things that have been planned for us by the officers of the association.

Looking forward to the pleasure of being able to shake hands with some of our members at the show in October, I am yours in the interest of the industry,

O. A. AMUNDSON, Secretary,
North Dakota Ice Cream Mnfrs. Assn.

SERIOUSLY INJURED IN BAD AUTO SMASH-UP.

It is with profound regret we learn of the serious injury of W. B. Atteberry, headquarters, Los Angeles, Calif., special western representative for the Hudson Mfg. Co., covering territory west of the Rocky mountains and Texas and Oklahoma. Mr. Atteberry had been to Hayward on Friday, Aug. 19, and was returning to Oakland via auto bus. One story is that a small car passed and cut in so close that to avoid a collision the auto bus ran into an iron telephone post, cutting the bus in two. The other story is that the small car was coming toward the bus and turned around in the middle of the street so close, and that to avoid the car the bus turned and ran into the pole. Mr. Atteberry was the most seriously injured. His shoulder was dislocated and one wrist fractured; his right leg broken between the knee and the thigh, a fractured thigh, the leg having to be ampututed below the knee. His left leg was also bruised and his head was badly scratched. At the time of going to press we learn, besides amputating of the leg, the shoulder has been set, but they have not as yet set the leg where it has been broken because Mr. Atteberry has not had sufficient time to recover from his shock.

W. B. ATTEBERRY

Mr. Atteberry was on his way to meet members of his firm, the Hudson Mfg. Co., at the Dairy Show exhibit, it being his intention to cover the territory on the way ,and in his eagerness to meet his trade he started ten days ahead of schedule time. Those who knew "Bill" Atteberry—this congenial, lovable and friendly fellow—and who have really learned to love him, were shocked when news of the accident first reached them. The flood of telegrams and letters which have reached Mrs. Atteberry and the Hudson Mfg. Co. indicate how much concerned Mr. Atteberry's business friends were over this unfortunate and untimely accident.

The Hudson Mfg. Co. offer this consolation, however, that in spite of the terrible injuries sustained by "Bill," he is recovering, though it will be quite some time, naturally, before he can resume any activity for the Hudson Mfg. Co. Those who witnessed the accident all speak in high terms of the wonderful bravery of Mr. Atteberry. Though seriously injured, and rapidly becoming weak from excessive loss of blood, "Bill" refused any help until all the others in the accident were aided first.

Mr. Gabe S. Wegener, president of the Hudson Mfg. Co., in speaking of the accident, said: "We loved Atteberry not alone as one of our associates, but as a close and dear member of the Hudson family, and the news of this sad accident pulled at the heartstrings. We are glad to report, however, that "Bill" will pull through it all and we are glad that, in spite of all, he is still a member of our family and will continue to be so."

If any of his friends should want to write him a line he can be reached by addressing W. B. Atteberry, care East Bay Sanitarium, Oakland, Calif.

TO THE TRADE.

For some time we have been at great expense experimenting with and developing our method and process of preparing an ice cream mix. Now that this method is finally developed and thoroughly tested and proven commercially, we have taken the necessary steps to protect our method and process by U. S. Letters Patent. We are now prepared to grant licenses for the use of this method and process and to supply and install equipment for carrying out the same. MOJONNIER BROS. CO.

The
Time Tested Tub Cover of Quality

There is no better test for the qualities of a product than time.

During its course a product like the **Quality Tub Cover** goes through a series of experiences and hard knocks that proves the weak spots in make-up, serviceability and cost.

The fact that after six years as users, original buyers of **Quality Tub Covers** send in repeat orders each season for new tub covers, should be proof enough for you to investigate the quality, price and serviceability of Quality Tub Covers.

"If Made from Canvas, We Make It"

West Salem Ohio

Advertise Delicacy and Food Value of Ice Cream

By M. D. MUNN, President, National Dairy Council

IF WE can credit the casual historian—the making of ice cream in the United States, in a small way, began about 125 years ago and the first ice cream soda was made about forty years ago.

If Dolly Madison, the famous beauty, who presided over the White House during her father's administration, and who is credited with the first serving of ice cream, could today behold the menu that the modern ice cream manufacturer can set forth, of the various varieties of ice cream, she would undoubtedly be dumbfounded; and, if the Detroit druggist, who, in a moment of desperation, added some ice cream to a carbonated drink, could behold the array of sirups, fruits and equipment used by the soda fountain of today, he would be staggered by the display.

Great as has been the progress and development of the ice cream industry, most of it has taken place in the last ten years. Yet the fact remains that the possibilities have hardly been touched and by most not realized.

While the modern means of manufacture, refrigeration and handling of this great product, together with the use of hundreds of delicious flavors, have all contributed toward building a solid ice cream business, above all these are the possibilities of the recent or newer knowledge that ice cream is a real food—a stimulating, body-building, energizing food, worthy of being placed in the front list in the nation's "What to Eat." How few people realize this and how much greater would be the magnitude of the ice cream industry if the rank and file knew this fact. Even many government officials are ignorant of this fact, and, as a result, we had the startling condition, during the war, of one branch of the government imposing a tax on ice cream as a luxury, while another branch of the government was advocating its use as a necessary and essential food.

In the new booklet on ice cream just issued by the National Dairy Council, there is a long list of the different varieties of ice cream. It is put there for a purpose. The public is just beginning to know ice cream. The rank and file do not yet know much more than that it tastes good and there are two kinds, "vanilla" and "chocolate." They know little or nothing as to its real food value.

By reason of this food value of ice cream, it occupies an important position in the activities and educational work of the National Dairy Council.

The volume of milk used in the manufacture of ice cream warrants the closest study of all problems that will increase and encourage its use. It is especially fitted for educational and publicity effort, because of its food value, in addition to its appeal to the taste and palate. How great would be its increased consumption if everyone knew that, in gratifying this natural taste and appeal to the palate, they are at the same time invigorating and stimulating the body.

Hospitals furnish ample evidence of the fact that ice cream restores health and strength to the sick; and scientific research furnishes ample evidence that it strengthens and invigorates the mind and body of the strong, and above all, furnishes a necessary food for the growing child. What a message this is to take to the public, in a constructive and educational way!

The possibilities of cooperative effort in spreading this educational propaganda, by the ice cream industry working with and through the National Dairy Council, are limitless. The Council is, at present, as far as its resources permit, talking the food value of ice cream in the schools, and to the mothers; but, financial support from the ice cream industry would increase this educational work a thousand-fold, all of which would redound to the ice cream manufacturer as well as to human welfare.

Ice cream should be kept in the foreground as a necessary food, and not as a delicious luxury. The public should, and must be brought to know more of, and to more highly appreciate the food value of this very palatable dish. To do this work, and to put this message over, requires, not only an organization, but the sinews with which to enable such an organization to exert its influence to the greatest extent. There must be a continual constructive effort to stimulate confidence in the public as to the value of ice cream, and the stability of its quality. United effort must replace individual effort or at least greatly support it. While some individual ice cream manufacturers are putting forth publicity efforts, some of which is very good and some very bad—mainly due to a difference of vision, or, perhaps—to state it more correctly—due to a vision in the one case, and a lack of vision in the other—one sees advertising of ice cream for what it really is, while, in the same city one sees advertising, the purpose of which is to create confidence in the product of one manufacturer, and to create suspicion as to the product of another. This kind of advertising is not constructive, and tends to bring down on the ice cream industry all sorts of effort for legislative and municipal regulation. I mention this because in the work of the council, in endeavoring to encourage the use of ice cream in the homes, in the workshop and in

POETICALLY SPEAKING.

Shall we gather at Twin Cities
In a week's vacation grand,
Where we'll meet the ice cream makers
Gathered from all o'er the land?

They will come from all directions
To attend the Dairy Show
And to meet in great convention
Makers of ice cream, pure as snow.

Shall we bring our wives and sweethearts,
Just to have a glorious week?
As we rest from season's business,
Thus the cool north we will seek.

There we'll meet and learn new systems
To improve our product grand,
Which is now a food delicious,
Recognized in every land.

They've prepared a splendid program,
And some entertainment great.
If you miss this, you'll be sorry
After it is all too late.

We are coming in a special
Chi-ca-go Great Western train,
Starting at Our Kansas City,
Center of Great U. S. A.

Yes, we are coming to Twin Cities,
We will bring our mascots, too.
Great big fine Kansas Jack Rabbits,
They eat ice cream, pure as snow.

Vanite

THE HYGIENIC CLEANSER

VANITE—The Hygienic Cleanser, renders a profound service to all who use it in the dairy industry.

An Invitation

A generous welcome is extended all visitors to the National Dairy Show and Conventions to make our plant and offices on University Avenue, Minneapolis, their headquarters.

The glad-hand of accommodation and welcome is inseparably attached to the knob of our front door. The minute you grasp it and enter you will find a spirit of "Service" predominating the surroundings and reflected in the quality and purpose of our products.

Come and see us, we will be glad to have you.

PYRAMID OIL COMPANY
ENDURING LUBRICANTS

the hospital, we are frequently asked: "Is it safe to eat all kinds of ice cream?"

The progress and development of the ice cream industry would be much more successful and rapid if everyone was talking and preaching the delicacy and food value of ice cream, and confined their efforts for improved quality and of criticism within the factory and the ice cream organizations.

According to government figures, 260,000,000 gallons of ice cream were manufactured during 1920—an increase of 30,000 gallons over 1919, or an increase of approximately 13 per cent. This output can be increased to one-half billion gallons by constructive and consistent educational effort on behalf of the industry.

Such effort in campaign work on behalf of milk, has shown an increase of over 15 per cent during the past six months, in one hundred cities in the United States.

I am not certain but that it would be easier to increase the consumption of ice cream than it is the consumption of milk. I am quite certain, however, that we should be consuming more than double the amount of ice cream we are, and that this result can be obtained if all ice cream manufacturers will join in a forward movement; by so doing, the industry will not only be helping itself, but will be rendering a service to humanity, as well as to the dairy industry.

ARE YOU GOING TO MINNEAPOLIS?

Yes, we know you are.

Last year we heard a learned man tell us how to "Keep step with the times," and now we are going to give you a few pointers on our own behalf on this subject.

First and foremost, Mr. Ice Cream Manufacturer, the principal way in which you can keep step with the times in your industry is to meet and mingle with your fellow manufacturers, discuss with them problems that may bother you, learn how they solved them and how you may do likewise.

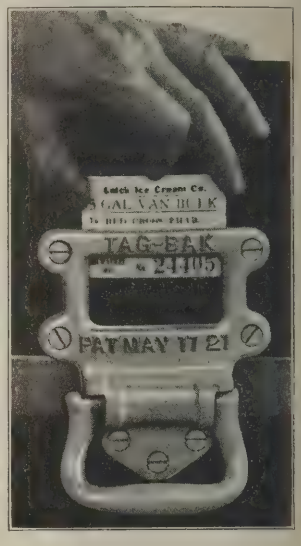
The papers that will be read at this convention will all deal with practical subjects of vital importance to ice cream manufacturers, and they will be presented by men who are fully qualified by experience to handle them.

It has been well said that "A successful man goes to the highest authority," so profit by this idea and at the convention make it a point to meet the men of highest authority in your industry. They will all be there.

A rate of fare and one-half for the round trip, on the certificate plan, has been secured. Dates of sale October 6th to 14th, inclusive. Return limit October 19th. Within a short time the Secretary's office will send out a letter detailing the procedure necessary when buying your ticket, in order to receive the benefit of the reduced rate.

The Ice Cream Manufacturers' De Luxe Special Train will leave Chicago on the C., M. & St. P. Ry. on the morning of Saturday, October 8th. This train will carry parlor cars, observation car, dining cars, and a coach for those not desiring parlor cars. No extra fare will be charged on this train.

The ladies have a special invitation to this convention, and extensive plans for their comfort and entertainment are now being formulated.



A copy of the completed program will be mailed out within a short time, but meantime a tentative outline is given herewith.

Make a note of the date of the convention. Arrange to attend. You'll enjoy every minute.

N. LOEWENSTEIN, Secretary.

EX-PRESIDENT OF NATIONAL ASSOCIATION TURNS INVENTOR.

The problem of checking back the returned ice cream shipping tubs and giving credit where credit is due has proved such a vexing one that Mr. W. F. Luick, who a few years ago was President of the National Association of Ice Cream Manufacturers, set to work on solving the problem in a way that has proved entirely satisfactory to his extensive ice cream business at Milwaukee, Wis.

The key to the whole problem, as many ice cream manufacturers have learned is the necessity of getting the tub returned with the original shipping tag having the dealers' address and shipping number. Mr. Luick accomplishes this through a unique tag holder. These holders are called "Tag-Baks" and, as their name implies, their purpose is to return the tubs with the tags as originally shipped.

"Tag-Baks" are not just a device for holding the tags, but form a part of a practical system for checking returned tubs, orders and shipments.

"Tag-Baks" are not just a device for holding the tags, but form a part of a practical system for checking returned tubs, orders and shipments.

The illustration shows a combination "Tag-Bak" for use on new tubs, or where broken handles are to be replaced. "Tag-Baks" are also made without the handles for use on old tubs. It is surprising how much trouble so small a thing as a lost tag can make, and the amount of service that can be developed from so simple a device as "Tag-Bak".

THE DAIRY SHOW AND ICE CREAM REVIEW COMBINE TO DISSEMINATE VALUABLE INFORMATION TO THE ICE CREAM MANUFACTURER.

By Elyria Enameled Products Company, Elyria, Ohio. B. E. Newell.

It is our belief that the National Dairy Show and its medium of publicity, the show number of the Ice Cream Review, act in combination, as a valuable means of disseminating information and advice on the latest and most improved processes and equipment of interest in the Dairy Field.

Some people may be inclined to look upon such an event from an advertising standpoint only, but it is our belief that it is a vital, influential factor in raising the standards of the industry and in combining the members of the various organizations into a body which can work inestimable good in furthering the aims of the industry.

It is for this reason that, year after year, we maintain space at the Show and advertise, to larger extent, in the show number of the Ice Cream Review. It is an opportune time to let the trade know what we have to offer in the way of service and equipment.

DAIRY SHOW MESSAGE TO ICE CREAM MEN.

By W. E. Skinner, General Manager, National Dairy Show.

The ice cream manufacturers in deciding to hold their convention in Minneapolis, Minnesota, during the National Dairy Show, October 8th to 15th, at the Minnesota Fair Grounds, builded big and have helped by this act very materially in delivering the big message of the National dairy industry the builders of the Northwest empire were desirous of having delivered to the men who are "carrying on" and making of this northwest country the seat of highest agricultural development in America.

The dairy cow is safely on her throne as the central figure around which successful agriculture revolves in the Mississippi Valley, and a trip through the northwest states of this rich valley is an inspiration to every dairyman privileged to make it. With a high resolve and a clear vision of the possibilities of carving riches out of this country, the farmers build their houses and barns permanently. They all look as though the owners had a firm belief in the eternity of things and their own ability to make the soil yield adequately. The homes are substantial and built for comfort; the barns are commodious and solid looking, intended to care for all farm development and to last forever. Every modern and sanitary device is installed therein and all these men who are operating these farms need is an opportunity to see this dairy industry of ours stacked up in national shape, to get under the better cow and better bull movement and to go on and improve the whole industry.

The strides they have made in dairy products production insures their right appreciation so that the conventions of the various integral parts of the industry and the Show will convey such an inspiration in a week that all of the fairs, and shows and instruction and research work going on in the entire nation could not give in years, and proves the proposition that when we all work together we are a power and an influence. When operating separately we are largely wasting energy.

Now all that remains to be done is for every man and woman interested in putting the ice cream business upon the highest possible plane for proper recognition in this big dairy industry as a whole, to constitute themselves as a committee of one to insure the success of all ice cream activities at their 1921 convention.

I have been privileged to get a glimpse behind the curtain of what is being prepared by the local manufacturers of St. Paul and Minneapolis for the visitors and I say it is great.

Come one! Come all! And let us make a showing of real strength and purpose that will be inspiring to each and all of us.

⚜

INDIANA ASSOCIATION STRONGEST IN ITS HISTORY.

In a bulletin to members, Secretary A. P. Holly, of the Indiana Manufacturers of Dairy Products, says that the membership of the association is the largest it has ever been. We might add that from all appearances it is still going strong.

⚜

The woman who marries a man to reform him would have equal success trying to sweeten rancid butter with cologne.

On Hand

We have always watched our stocks closely, never permitting them to become so low that we could not give immediate attention to your orders. And the trade has learned to appreciate this and depend on it. A good policy for both of us.

CANVAS PRODUCTS CORPORATION

FOND DU LAC, WISCONSIN

SEALRIGHT COMPANY, INC., SAYS, "COME TO THE DAIRY SHOW."

"Yes, siree," and most emphatically so, we believe in the National Dairy Show. We know of no single event in the dairy industry of such great importance to all of us as the Dairy Show. Here is the one big opportunity of the year to "meet up" with the doers, those who make for progressive dairy development.

It would be difficult to imagine how any wide-awake ice cream manufacturer, on the alert for better ideas and for means of making his business a better business, is not going to get full value received by attending the Dairy Show. With the splendid opportunity of rubbing elbows with progressive manufacturers, exchanging ideas, seeing the latest and best in equipment on display and having this new equipment thoroughly explained, surely every ice cream manufacturer will return to his business enthusiastic, stimulated and "full of fight" to make his next year a bigger and more profitable year.

We are strong for the Dairy Show. And we believe every reader of The Ice Cream Review who attends it and visits our booth will be impressed with the fact. Our faith in the Dairy Show and the extent to which we are glad to support it will be best expressed by these two facts: (1) We have taken considerably larger space this year. (2) Our display will be a most impressive one. We shall not attempt to describe it here other than to state it will be very much worth your while to visit it. It will give you some very vivid and striking ideas which you can take home with you and apply in a practical and profitable way in your business.

SUGGESTIONS WANTED.

To All Members:

You have received a former letter announcing the dates and city for the 1921 convention. In that letter we requested you to send in any suggestions for papers to be presented, and if possible to name some speaker whom you believe would be most competent to present the same.

It is the desire of your program committee to make these meetings both interesting and instructive. This is your convention and your co-operation is both required and requested.

Do you favor formal addresses of general interest to the industry, or would you prefer subjects of interest to manufacturers' problems to be discussed by men in our organization who are qualified to talk on such topics?

As the committee on arrangements will have charge of the local end of the convention, we will advise you later on just what has been done, but, when it comes to the program, don't say, after it is all arranged, you would like to have a certain subject discussed. Now is the time; send in your suggestions to the Secretary and it will receive prompt consideration.

We also wish to call your attention to the National Dairy Show to be held on the Minnesota State Fair Grounds, Oct. 8th to 15th. This will include the convention of National Ice Cream Manufacturers, the International Milk Dealers, and other branches of the dairy industry.

This is a wonderful source of information and instruction, with a royal good time thrown in. The West always sends a good delegation, so let's go and show "the boss"—Mrs. VanderBie Babcock, of St. Paul, chairman of the committee, we will do our part.

In the meantime, don't forget your own convention —Nov.. 14th, 15th and 16th, in Seattle, Wash. It is going to be some meeting, with a probable trip to Vancouver, B. C., as an oasis.

Headquarters: Hotel Washington. Bring your plant men with you.

HOME PROCESS FOR MAKING SODIUM HYPOCHLORITE.

On another page appears an advertisement by the Electro Chemical Company calling attention to their process of producing sodium hypochlorite for disinfecting purposes. It is claimed that by the use of electrolytic cells it is possible to produce the product at a very low cost. Where electricity can be obtained for two cents per kilowatt and salt at ¾-cent per pound electrolytic hypochlorite of soda can be produced for about one cent per gallon. This should prove of interest to large users whose plants are supplied with electric current.

Those who do not care how they spend their money are generally equally careless in the methods of acquiring it.

Jensen Creamery Machinery Company

BLOOMFIELD, N. J. OAKLAND, CALIF.

Southern Representative:
Blanke Mfg. & Supply Co., St. Louis, Mo.

ALLENTOWN, PA., TO GET NEW ICE CREAM PLANT.

The following is extracted from an article appearing in a local Allentown newspaper, relative to the city's newest industry:

"The M. & G. Ice and Ice Cream Company, their factory being located at Tamaqua, with service stations at Allentown, Bloomsburg, Wilkes-Barre, and Scranton, have decided to build a factory at Allentown to take care of their increased businss, to cost approximately $500,000. Plans are now being made by various architects, and the one most adapted will be selected. This will be a modern ice and ice cream factory, and probably the largest of its kind in the State of Pennsylvania. The building will occupy the ground purchased a year ago, 222 feet by 290 feet, located at the northeast corner of Union Boulevard and North Plymouth street, in the Fifteenth Ward of the City of Allentown, along the intended boulevard between Allentown and Bethlehem, and will be 160 feet frontage on Union Boulevard by 160 feet deep, with railroad siding adjoining.

This building will consist of a modern fireproof reinforced concrete and brick building, and will be three stories high. The building will be used exclusively for the manufacture of ice and ice cream, and will also have in conjunction with the factory a garage to store thirty trucks, a truck repair shop, a paint shop, cabinet shop, retinning can shop, and their own sign and advertising shop, and also a tub cooperage shop; or in other words everything used in the manufacture and service of ice cream will be made right under one roof. The plant will be designed with the foremost purpose of cleanliness, and their entire manufacturing process will be in full view of the public to show how M. & G. ice cream is made and where no hand touches the product from the time of its mix until it is delivered to the customer.

The ice cream freezers will be eight in number, and of 400 quart capacity each, which will give an output of 8,000 gallons in a ten-hour day, and working two shifts will manufacture 16,000 gallons a day, or an average yearly output capacity estimated at 29,200,000 gallons, working eight hour days. The hardening rooms will also be located on the same floor. These rooms are used to harden the ice cream after freezing. These rooms will be of heavy insulation and will hold approximately 40,000 gallons of ice cream.

The can washing and sterilizing machines which will be the most modern of their kind, where the can is placed at one end and comes out clean and sterilized at the other end, will be located on the same floor, and will be right in back of the freezing room.

The loading car will be loaded on North Plymouth street, with railroad siding adjoining, with platform capacity provided to load eight trucks at one time. Four mammoth ice crushers surrounding each conveyor will be installed to crush ice for loading these trucks to serve the customers. There will be thirty trucks used in serving Allentown, Bethlehem, Easton, Phillipsburg, Northampton, Catasauqua, Nazareth, Bath, Bangor, Kutztown and territory along into Reading. These trucks are of the A. B. C. type, made in St. Louis, and have special refrigerator bodies, which makes salted ice unnecessary and eliminated salt water from ruining asphalt streets in the town and cities wherever these trucks will serve.

On the second floor the main offices of the company will be located. These will be very large and roomy. There will be a general office, directors' rooms, president's room, sales office, purchasing department, advertising office and private offices for the executive office of the company. The laboratory will be adjoining this, where all ingredients used in the manufacture of ice cream will be tested, the same as tested at the factory at Tamaqua, Pa.

The mixing room on the second floor will have all modern appliances for the clean and sanitary production of the mix. It will be in tile floors and terazza. It will contain two 1000 gallon pasteurizers, two homogenizers, two clarifiers to clean the milk and cream, and four 2000 glass lined cooling vats for the holding of the mix until it is ready to freeze. Large sized elevators will be installed.

The raw cream storage room for the holding of the cream will be placed on the third floor. As all cream and milk in its raw state is bought in carload lots, same will be dropped inside the platform in the building in a large receptacle with pump connections which will pump this cream and milk into the vats on the third floor, eliminating a lot of handling of cans and assuring sanitary conditions.

Two hundred and fifty tons of ice tanks for the manufacture of ice, and two large ice storage rooms will be provided to hold approximately 5000 tons of ice. In addition to this the third floor will be used for the storage of all other raw materials and for the repair and making of cabinets, retinning of cans and laundry for laundry of clothing of the help who will be continually dressed in white, the sign painting department, and also the tub cooperage department.

The basement will have the most modern ice making refrigerator machines of 300 ton capacity also other auxiliary apparatus such as pumps and air compressors, which will be used in pumping the water through the buildings for which artesian wells will be

Some Special "Off Season" Business Opportunities for Progressive Ice Cream Manufacturers

There are always a lot of people demanding "something different" for card parties, dances, banquets and various other social functions. Ice cream novelties fit in where many other novelties fail.

Your ability to furnish a fitting novelty enables you to suggest your specialties for specific social functions.

Innumerable ways are open to the progressive ice cream manufacturer to promote sales through the use of assorted centers, using different designs and coloring to beautify the goods for the Fall and Winter season.

An outfit is inexpensive, offers big possibilities and the different attractive designs and combinations can be changed often.

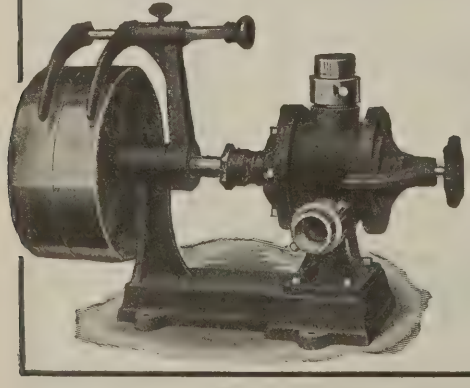
sunk, as M. & G. in all the factories that they build use their own water.

Operations to commence between September 15th and October 1st, and the plant is to be completed on or before March 1st, 1922. Just as soon as plans have been decided on bids will be asked for and work rushed to completion.

History of the M. & G. Company.

The M. & G. Company was organized as a partnership existing between John G. Mealey, the originator of this ice cream business, and John I. Goade, in May, 1919. Ground was broken for their plant at Tamaqua, Pa., May 12, 1919, and completed September 24th, 1919, making ice cream four months and twelve days after ground being broken. The remarkable growth of this company is evidenced by the fact that within less than two years' time the factory at Tamaqua has been overtaxed in the capacity of ice cream making and on January 1, 1921, the company was incorporated, taking in the following directors, to-wit: Carl Bauer, Oscar G. Tallman, John A. Nallin, Fred W. Weaver, Jacob Maurer and Joseph Gorman and J. H. Walker, with the co-operative plan in mind so as to enable them to expand and take on territory demanding the wonderful and superior product. Accordingly after the incorporation they established a service at Bloomsburg, which takes in that territory of twenty-mile radius of the towns of Nesquepeck, Berwich, Shickshinny, Danville, Sunbury and many other hamlets and and towns in that section. Later on, in February, they decided to open Allentown, and have made such remarkable success that the result is that they decided to build this factory here to take care of the increased business. Since having this in mind they are opening Scranton and Wilkes-Barre as one service station, September 1st, which next spring will be two separate service stations, and will take in all the towns in that territory. It is a wonderful achievement and shows good business methods that has made this great expansion possible, and when the plant at Allentown is finished the public in this vicinity will be invited through their dealers to go through this plant, and not only see how M. & G. ice cream is made but have a taste of the superior quality, and they state that they will assure the public that from time to time, as production increases, the service will be improved upon to the remotest territory.

If you are tired of your business, don't worry over it. Advertise it for sale in The Ice Cream Review Want Department.



REVOLUTIONIZING OLD ESTABLISHED IDEAS TO COMPLY WITH TWENTIETH CENTURY DEMANDS IN THE WHOLESALE MANUFACTURING OF ICE CREAM.

From time immorial the wholesale manufacturers of ice cream seemed to feel that the ideal type machine for manufacturing their product successfully was represented by what is known as the 40-quart machine; they based their conclusions entirely on the thought that any larger type machine was impractical, owing to the length of time consumed in emptying, which would tend to beat the swell out of the mixture to the detriment of its character and value, which theory was absolutely correct based on the old-fashioned principles of construction, etc., with the result that, as the demands on the ice cream factories developed, in order to accommodate the condition, the ice cream manufacturers naturally had to add additional space, capital, labor, etc., in order to take care of these demands, until a situation developed where a number of the factories have from a dozen to twenty 40-quart machines in a row occupying a space anywhere from 400 to 800 sq. feet, representing considerable investment, and calling for additional labor in order to take care of the many machines while in operation, as well as considerable expense devoted to the repairs and upkeep of such a number of machines, a condition which eventually brought the ice cream manufacturers face to face with the high cost of overhead and demand on space, a fact which demanded considerable amount of study as to the way of overcoming what was developing into an actual loss.

They very nicely adopted the sane method of taking up this condition with some of the reliable machinery manufacturers, who in turn have devoted the resources of their Engineering Department, their Drafting Room, their Shops, and personal experiences and knowledge, with a lavish hand, in an effort to overcome these trying conditions, with the result that the leading manufacturers of ice cream machines are to-day devoting their most earnest attention to developing a type of apparatus which, while constructed on the same general lines as the smaller machines in universal use, are capable of turning out large batches ranging up to more than four times the size of the smaller standard 40-quart, doing it with less cost of power, less labor cost, occupying considerably less floor space, costing considerably less money in proportion, and turning out as good, if not a better product in less time than with the smaller type machines.

The writer while making a personal investigation of this subject amongst a number of the leading manu-

Taber Creamery Pumps

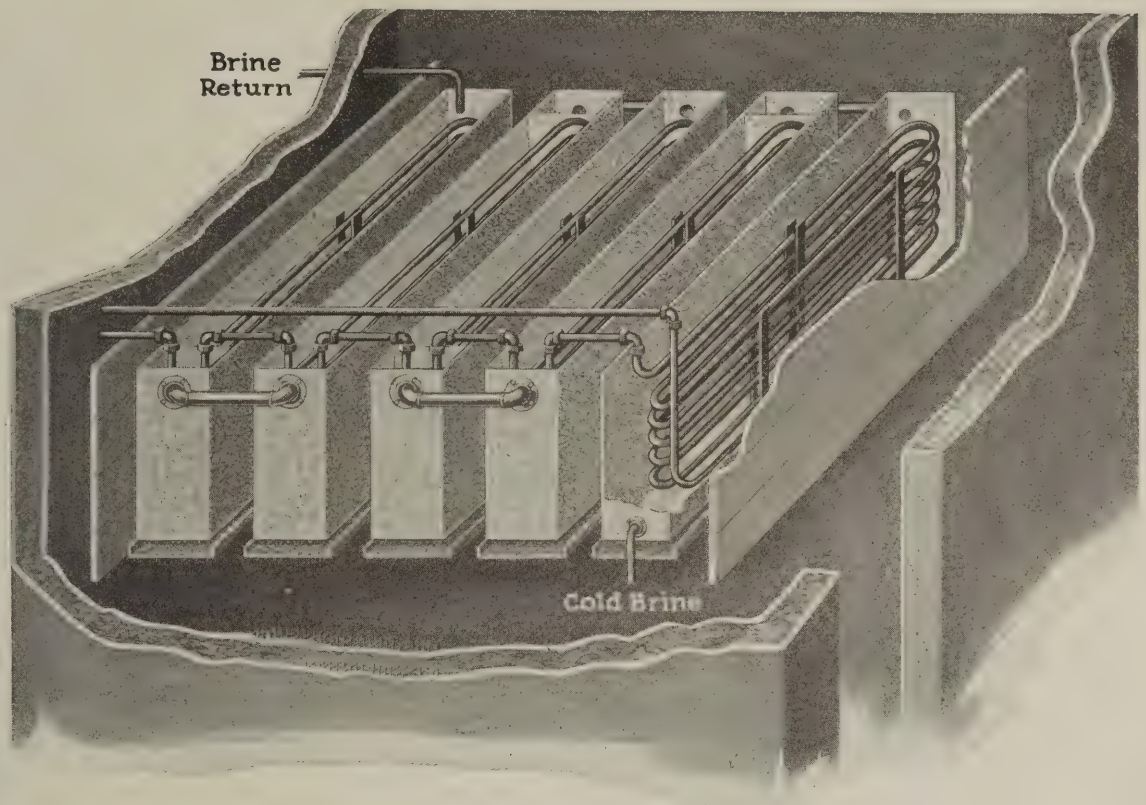
Automatic Cone Machines

with which you can make a better cone, at a less cost, than with any other known device.



Prepare now for 1921 cone business.

We also have several automatic machines of another make, as good as new, on which will make attractive prices.

Will thank you to write us.

The Cream Cone Machine Co.
CLEVELAND, OHIO

Do you maintain the same temperature in your brine from the start of cooling milk to the finish?

The above illustration shows the X L Refrigerating Co.'s brine storage system for pasteurizing and cooling milk and cream. This system consists of a series of tanks having direct expansion coils submerged in brine.

The tanks are connected from one to the other by large equalizing pipes in such a manner that the coldest brine comes in direct contact with the coldest ammonia, thereby giving you a steady even temperature of cold brine at all times from the discharge tank. Owing to the fact that the warm brine enters where the ammonia is the warmest there is a uniform difference in temperature in each tank between the expansion coils and the brine.

By using the X L system we can guarantee to store 3 to 4 times more temperature than you can get by using the double pipe or shell type brine cooler which is liable to freeze and burst at any time.

Important Facts You Should Know

More than double the refrigeration stored in the brine equal to our combined tanks.
More than double the radiation in your storage cooler after pasteurizing.

Our engineers are at your service at all times; they are experts in this line.

If you contemplate installing any new refrigerating equipment or making any changes, consult us before you buy. We will explain and show you a superior equipment which costs less and has less operating expenses.

facturers of ice cream during the past few weeks in an effort to get a clear cut expression from the factory heads, was amazed at the general approval of the new thought "that the larger size machines have come to stay";—they were doing everything that was expected, producing the swell, a smoother product, and, strange as it may appear, do the actual work in about the same time it took to freeze with the smaller apparatus.

During these investigations we found that one of the leading manufacturers of machines proposed to show one of their very large machines at both the National Dairy Show, and the Buffalo Convention as well. This apparatus, as designed, will be practically a "continuous performance machine," the capacity of which will be about twice the quantity of any other machine of its kind yet built, and as this concern is one of the oldest and leading manufacturers of the line, we feel that his assurance of the practicability of such a type machine is a forerunner of its success, which only tends to prove that this revolutionizing of the manufacturing end of the ice cream business apparently is yet in its infancy, and we would suggest to the readers of this article that while at either the Dairy Show or the Buffalo convention that they pay particular attention to the actual developments that have occurred in the manufacturing of these larger type ice cream machines during the past year, all of which has been done with the thought in mind of trying to keep astride of the demands of the 20th century wholesale ice cream trade.—Contributed.

IOWA DAIRY COURSE.

The six month's dairy course offered by the dairy department of Iowa State College will begin this year on September 26th. The fall quarter closes December 22nd. The winter quarter begins on January 2nd and closes March 22nd, 1922. Anyone desiring to take only three months work may register for work in either quarter.

The training acquired in the six month's course together with practical experience, enables the students to fit themselves to manage and operate dairy establishments. Butter, ice cream, and cheese factories and market milk plants all drawn upon the six months' course for men. Some of the students, however, engage in the dairy business for themselves upon completion of their course. A student desiring to enter the six months' course must be at least seventeen years of age, and must have satisfactorily completed the eighth grade of the public schools or its equivalent. Students with some experience may be recommended for positions by the department after one three months' term, but those without previous practical work are required to complete satisfactorily the six months' course before receiving the recommendations of the department. A certificate is granted to those who complete the course satisfactorily and give evidence of having successfully operated a dairy establishment for a period of two years.

Students may enter the six months' course in either the fall or winter quarter. The studies outlined for the two periods are as follows:

Fall Quarter	Credits
Dairy Practice	6
Buttermaking	2
Milk Testing	2
Manufacture of Ice Cream and Ices	2
Dairy Chemistry	2
Dairy Machinery	3
Dairy Cattle, Breeds, and Judging	2
Physical Training (Required)	0
	19

Winter Quarter	
Dairy Practice	6
Buttermaking	1
Cheesemaking	1
Milk Testing	1
Factory Management	2
Judging Dairy Products	1
Market Milk	1
Dairy Bacteriology	2
Dairy Cattle, Feeding and Management	2
Farm Crops Production	2
Physical Training (Required)	0
	19

The ten day short course for experienced operators and managers of dairy plants is given from February 8 to 18, 1922.

Standardization of Ice Cream

By Weight Per Unit Volume

De Raef weight standardizer tells you at a glance the correct weight per gallon, while the ice cream is still in the freezer, giving the ice cream maker full control of a standard weight per gallon as well as a given over-run.

No weights—no charts—no counter balances —no telescopic cups — no adjustments — no magnifying glass to read dial—no figuring—always ready for operator—water proof and rust proof.

Works automatically—reading can be made ten feet away—large black figures on white dial. Will give correct weight per gallon of ice cream, regardless of weight per gallon of mix.

De Raef Ice Cream Weight Standardizer circular sent on application to the Ice Cream Department

N. A. KENNEDY SUPPLY COMPANY
KANSAS CITY MISSOURI

MICHIGAN MEN MAKE MERRY AT BAY CITY.

Michigan Association of Creamery Owners and Managers Have As Their Guests Members of the Michigan Allied Dairy Association and Michigan Dairy Boosters.

By F. R. Frary, Secretary.

Thursday morning (Aug. 11) broke with the gray clouds hanging dismally close and a chilly northeaster doing her best to battle old Lake Huron into Saginaw Bay. But it takes more than this to daunt the courage of the Michigan bunch, and as we filed up Center street, from the hotel to the Board of Commerce building, our numbers and the attractiveness of our crowd (he was looking at the ladies then) bewildered the traffic cop to the point of holding up all cross town business awaiting our leisure in marching the three blocks. Old "Sol", too, smiled on us after his early morning bluff had failed.

When Lewie and his crew had completed their last lap in the distribution of fish laden plates, just 142 elbows were keeping time with hay-tedder precision to Charlie Porter's jazz orchestra, which, believe me, was going some.

After the smoke cleared away and the bones were removed, the same said Charlie Porter proceeded to further punish his captors by demanding that they actually sing three closely typewritten pages of home-made doxology, phrenology and bunkology designed with more or less evil intent to apply to local conditions and individuals.

After this very clever (?) stunt, it was discovered that the meeting was without a president, vice-president or even an acting chairman, so upon someone's suggestion, Mr. Seidel was quite appropriately selected to fill the Chair.

Martin's judgment in the past had never been questioned, but on this occasion he weakened and his first act was to call on a personal Bay City friend of his, by the name of O'Toole. Mr. O'Toole made a good fellow of himself all right by occupying the stage for twenty minutes and amusing the crowd by his perfectly natural can't-help-it exhibit of wit and humor. But the next act was the crucial one. O'Toole has two young sons who have been in the professional boxing ring for four years and he climaxed his part of the performance by pulling a four round, honest-to-goodness boxing match. The boys were well matched, and a knock out blow at near the end of the fourth round had the ladies holding their already fluttering hearts.

Strange to say a burly policeman who had stood in the door witnessing the major part of the fight, had been apparently unnoticed until he strutted into the middle of the floor and demanded to know the chairman of the meeting. Someone blurted Seidel's name, wherupon this 250 pounds of "beef" bore down upon our white-faced, quivering Seidel, like a wild buffalo would charge at a sick sheep. The charge was of conducting a prize fight in violation of a city ordinance, and, in spite of demonstrations, friend Seidel was rudely ushered out, the officer all but being mobbed by fury-flamed men and indignant women. A committee of influential men, with C. H. Parker at their head, was quickly organized, and was preparing to speed to the city hall to bail out our disgraced leader when they met in the door the same officer, but with another Seidel. The Seidel that left a few moments before was white with fright, but when he returned dressed in a prisoner's garb, a grin as of satisfaction played across his face. Some men shouted for joy, while others shouted with anger; women wiped their eyes, and, finally, when order was restored, the rest of the program was completed without interruption.

Professor Bouska, in a report of some right recent research work, told of quite valuable findings regarding the acidity of butter. His address was too long and too valuable to attempt to give even the essence of it here, but we shall attempt to send this to our members later in a comprehensive form.

Professor Reed, Professor Anderson, Chas. Hack, Mr. Wendt and others spoke briefly. The Treasurer's and Secretary's reports were read, and the meeting was abandoned.

Mr. Frary is too modest to send us a copy of the songs he mentions in the above report, but we have other means of getting a good thing when we want it. The following were composed by Mr. Frary:

Good Business.

Key of G.

(Tune: "Auld Lang Syne")

Come men around this festive board,
Do honor each to all.
We'll bury hatchet, sheathe the sword
And heed a common call.
And here in friendship's nobler aim
We join our voice and hand
To tell the world in simple strain
That we a unit stand.

True, nectar's cup of sweet revenge
Stands beck'ning on the bar,
And we have quaft it long and oft
But learned to cast it far;
For ere we vent our foolish wrath
On brother, friend or foe,
We'll use the X-ray's searching gaff
Lest we the guilt might show.

We design your new plant to fit or make your present one fitter

A thorough knowledge of ice cream making, together with our wide experience in industrial plants, enables our staff of engineers to design a low cost high efficiency plant for you, or to increase production in your present one. One of our engineers will call on request, without obligation.

CHICAGO
645 N. Michigan Avenue

FRANK D. CHASE, Inc.
ENGINEERS—CHICAGO

ST. LOUIS
Railway Exchange Bldg.

So brothers here we blend our song
In nobler, saner strain,
Admit the goods of being wrong
And bear three-fourths the blame;
For when we've thus admitted fault
We've only done our part
To heal the breach and call the halt
That saves our business heart.

* * *

Key of F.

(Tune: "There's a Long, Long Trail")

There are green, green fields of clover,
There's scent of new mown hay,
And the calves are loudly bleating,
And the chickens lay;
There's the purr of sep-a-rator,
And my dreams all come true,
For I cashed my check today and
We'll get a "flivver," Sue.

I love those green, green fields of clover,
The scent's sweet to my nose.
I love the calves and Rover
And the home's repose.
I love the farm and fields and friendships,
They're the hope of my dreams,
For the cows they pay the mortgage
And the whole world gleams.

* * *

(Tune: "What's the Matter With Father?")

What's the matter with Overton of Allegan?
What's the matter with Kroft and the whole darned gang?
They make up butter and barrel the milk,
They sugar the whey and gloss the silk.
What's the matter with Overton, so spick and span?

They say he's due to be married—this fine young man;
But it hasn't happened yet, and we doubt if he really can,
For he's got three children an' a pony cart,
A Cadillac an' an awful start.
What's the matter with Overton, the president of our clan?

HELP, OR MILLIONS DIE.

There is famine in Russia—one of the most appalling tragedies of want known to history.

According to official reports thirty-five million people are threatened with early starvation.

Out of this tragic misery twenty-five million women and children cry for bread.

We appeal to you to help us save these suffering millions.

Owing to our work of distribution in Russia being carried on through the American Friends' Service Commiteee—a non-political, non-sectarian and non-racial force of humanitarian workers already on the ground and actively engaged in relief service—we are in position to make your gift render quick and effective aid.

Do not wait. Hunger cannot wait. Send your contribution **to-day.**

DULUTH COOPERAGE CO.

DULUTH MINNESOTA

THE "WACHO" IS DEVICE FOR STRAIGHTENING CANS.

The "Wacho", a new type of machine, designed for straightening dented cans, has been invented by Walter Wachowitz, president of the Manitowoc Plating Works, Manitowoc, Wis.

This novel and timely machine, which is the result of his ingenuity, it is claimed, means the saving of

thousands of dollars to the manufacturers of ice cream and to the operators of hundreds of dairies throughout the world. The machine is very easily operated and requires no skilled mechanic. It is a comparatively simple device and weighs slightly in excess of 1,000 pounds and is equipped with three 18 inch 80-pound rollers which are operated by a lever. Two of the rollers remain on the outside of the can while the other circles the inside. The machine can be operated upon one and one-half horsepower and moves on high speed gears and sprockets.

Business men of the United States and London, England, have already made Mr. Wachowitz offers for his patent rights.

The advertisement, which concerns this machine, can be found on another page in this issue of The Ice Cream Review.

FRANK J. TOWAR WAS VETERAN IN CREAMERY BUSINESS.

The death of Frank J. Towar, the veteran creamery head of the Towar Creamery Co., of Detroit, Mich., is a great loss to that community, and he will be sadly missed by all who knew him.

Mr. Towar was 68 years old and came to Detroit with his father, Geo. W. Towar, in 1860. His father, at that time, founded the Towar Creamery Co. with which the son was associated and of which he became president and general manager in 1890 at the time of his father's retirement. He kept the active direction of affairs of the company until five years ago.

In 1882 Mr. Towar was married to Mrs. Elizabeth Sherwood Jelly, who survives him. There are three sons, Edgar T. of California, Albert J. and Frank J. Jr., and two daughters, Marion and Margaret, all of Detroit, left to mourn his loss.

Mr. Towar passed away at the Grace Hospital, where he had undergone a minor operation; his death was attributed to shock.

Another New Development in Condensing Pans

Which Increases Capacity 25% Reduces Labor—Easier to Clean—Lower in Cost

OUR new type pan evaporates more milk per pound of steam; it condenses the vapors with less water; it requires less height and can now be erected in most plants without building changes. The milk outlet of the pan is in the bottom close to the side and eliminates the necessity of getting under the pan to draw off the milk.

Another notable feature is the simplicity of cleaning. Both the pan and condenser are cleaned with minimum effort. The sides of the condenser are readily accessible and can be easily kept just as clean as the pan—and with no more effort.

Best for Condensed Milk—Evaporated Milk
Ice Cream Mix — Condensed Buttermilk

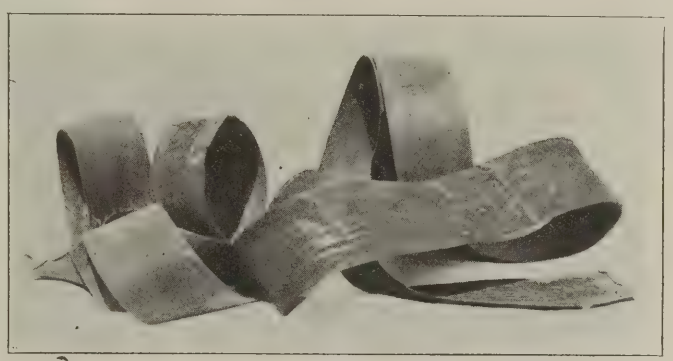
The Care of Leather

From Bulletin No. 1183, by F. P. VEITCH, Chemist in Charge, H. P. HOLMAN and R. W. FREY, Assistant Chemists, Leather and Paper Laboratory, U. S. Department of Agriculture, Washington, D. C.

FOR several years the supply of leather in this country has barely met the demand, even with an annual importation of hides and skins nearly equal to the domestic supply. This condition, due largely to extravagance, to fads, and to neglect, makes it highly important that the American people see to it that their boots and shoes, harness, and machine belts last as long as possible.

As a nation, we buy some 300,000,000 pairs of shoes a year. Our needs could be supplied by 250,000,000 pairs, if they were well cared for and kept in repair. As a rule, harness lasts the farmer far less than ten years. If the right kind of attention were given to its manufacture and use, it should last for 20 years or longer. Belts for driving machinery often become impaired, if not useless, within a few years, even on straight drives. A good leather belt, suited to the work to be done and properly installed, will run for from ten to thirty years.

Result of Lack of Care or Poor Quality of Leather Belting.



Every pair of shoes, every machine belt, and every piece of harness that is allowed to go to waste or that is not made to yield full service must be needlessly replaced by other leather, thus keeping prices high. Including leather made from imported hides, the leather supply in the United States is large enough to provide every one with an average of two, or even two and one-half pairs of shoes a year and to keep them in repair, as well as to replace all harness and machine belts every ten or 20 years, at reasonable prices. It is doubtful, however, whether the leather-making materials produced in this country, supplemented by those which can be imported, will suffice to meet the demand for three or more pairs of shoes a year for each person, for a new harness every two or five years, and for new machine belts every five or ten years, as is now too frequently the requirement.

The suggestions and directions given in this bulletin, if followed by the public, will go far toward conserving the supply of leather, and materially reduce the individual expenditures for leather goods.

Harness

Harness made of good leather and heavy enough for the work required of it will last for many years if cared for properly. It is more economical to buy harness that is too heavy than to buy that which is too light for the work. With good care, harness of the proper weight and quality will last at least fifteen years, and in many cases harness used on the farm has been in service for twenty-five years or longer. On the other hand, the Department of Agriculture has received many reports, especially from the Southern States, showing that harness lasts only from two to five years. This should not be so. It means that the harness used is too light, is of poor quality, or is not cared for properly.

Selection. Select harness with care. See that it is well made. Make sure especially that the reins, breeching, holdback straps, tugs or traces, belly bands, and yoke straps are sufficiently heavy and strong for the work required. A runaway team cannot be controlled with weak reins, nor will weak tugs and straps stand heavy work.

Effect of Proper Care of Leather Belting.

No portion of the harness should show cracks on the grain side when the leather is sharply bent. New leather that does this is worthless for harness or belts, and old harness or belts showing cracks are deteriorating and will soon fail if subjected to heavy loads. Since strong acids prove injurious to harness leather in time, it is to the purchaser's best interest to buy harness which does not contain such materials. Grease in moderate quantities, up to 20 per cent, protects, preserves, and strengthens harness leathers. More than 25 per cent is not necessary.

Care. Neglect of harness results in injury that greatly lessens its durability. The sewing, which should have been done with strong waxed linen thread, must be kept in good condition. All buckles should remain solidly in place. It is advisable to wash and oil harness frequently.

For washing, use tepid water, a neutral soap, such as castile or white toilet soap, and a sponge or fairly stiff brush. Hardened grease is very conveniently removed by scraping with a dull knife. Rinse in clean, tepid water, and allow the harness to hang in a warm place until it is no longer wet, but still damp. Then oil it and leave it in a warm place for 24 hours before being used. Harness should be oiled or greased while still damp; otherwise, it may take up so much grease that it will pull out of shape or take up sand and grit, which will injure it, as well as spoil its appearance. Harness should never look or feel greasy.

Neat's-foot or castor oil, or a mixture of these with wool grease, is good for driving harness. For heavy harness use a mixture of tallow and cod oil, or neat's-foot oil and tallow, or a mixture of any or all of these with wool grease to make a paste having about the consistency of butter. Apply the grease lightly to driving

Tell Your Friends and Neighbors You Are Going To The WORLD'S GREATEST DAIRY SHOW, MINNESOTA STATE FAIR GROUNDS, October 8-15

The Home of "Vanite"

The Pyramid Oil Co., whose general offices and part of their plant at 2424 University Ave., Minneapolis, is shown in the above picture, has capital stock of one-half million dollars.

At the present time this company operates 80 tank stations throughout the northwest, Minnesota, Wisconsin, Iowa, North Dakota and South Dakota. It also has distributing agencies as far west as Seattle and San Francisco. The plant in Minneapolis has a storage capacity of 300,000 gallons of gasoline and 175,000 gallons of lubricating oils. It is fully equipped for the manufacture of high grade soap and soap products, core oil, greases, auto oils and other lubricating oils.

Recently the Pyramid Oil Co. took over the manufacture of the celebrated polish, Waxit, and they have increased the use of this commodity until it now has a National distribution.

Among the other lines manufactured by this company are Vanite, the great water softener, which is very popular in the dairy industry. Its use is constantly increasing and is endorsed by many leading ice cream factories, milk bottling plants, creameries, cheese factories, etc.

Officers and directors of the company are as follows: W. M. Jacobson, president; Dudley Warner, vice president; G. N. Mitchell, vice president; C. O. Teisberg, secretary; C. E. Ekstrom, treasurer; J. N. Knutson and Chas. J. Hedwall.

Sales Department: G. N. Mitchell, sales manager; F. A. Kortsan, assistant sales manager and advertising manager.

---

such preparations may be recommended, avoid them. Their use will hasten the rotting of the leather.

Should any part of your harness break under circumstances that indicate leather of poor quality, you are asked to send about one foot of the broken strap to the Bureau of Chemistry, United States Department of Agriculture, Washington, D. C., with a full and careful statement as to how long you have had the herness, what care you have given it, and the conditions under which it broke.

Driving Belts.

Selection. Belts for driving machinery should be selected with particular care, bearing in mind the character and continuity of the work each is to do. The selection of the proper belt for a given installation involves consideration of load, width, thickness, length, speed, ply, size of pulleys, and horsepower. Ordinarily the competent belt maker's advice as to the proper belt for a given installation should be followed.

It is more economical to use a belt that is too wide than one that is too narrow. If the belt is not suited to the work it gives trouble continually, causing shutdowns of machinery that will quickly cost more in loss of time and wages than many good belts. A belt should always be sufficiently flexible to cling closely to the smallest pulley over which it passes. If it does not, it is not adapted to the work, and, in addition to loss of time due to frequently running off, it may crack on the grain within a short time, thus weakening it as well as causing it to stretch (fig. 1). Furthermore, it will slip on the pulley, thus losing power and becoming heated, which hastens its deterioration. A belt should run slack rather than tight.

Note carefully the condition of the belt when it is new. While it evidently contains grease it is not greasy. It should be flexible and feel firm, mellow, and smooth. An effort should be made to keep the belt as nearly as possible in its original condition. Do not allow it to become hard and harsh. It will run from ten to twenty-five years or longer, provided, of course, it was well made from good material, is adapted to the work, and is kept in good operating condition (fig. 2). Heavy, wide belts last longer than small belts.

Care. Satisfactory service cannot be expected from a belt that is too light or too heavy or otherwise not adapted to the work. Neither can a belt be made to give satisfactory results if it slips, does not run true, is not properly laced, is run too loose or too tight, is subjected to rapidly alternating light and heavy loads, is alternately wet and dry, is run on pulleys that are not true or are too small for the weight and thickness of the belt, or is neglected and allowed to deteriorate for lack of grease. Keep the belt clean and free from excess of grease and belt dressings. Unless frequently wiped off, dust and dirt work into the belt and damage

[1] Castor oil will not mix well with mineral waxes, such as petrolatum or paraffin.

Great Educational Value as Well as Business Opportunities Offered by National Dairy Show

By U. S. Freezer and Machine Corporation

THE big National Dairy Show is, by virtue of its size and scope, one of the most impressive spectacles offered in the course of the business year, as befits one of th largest industries of the land — the dairy business.

The convention of the National Association of Ice Cream Manufacturers, being held at the same time and place that the big National Dairy Show takes place, gives ice cream manufacturers double reason for being there. Tremendous strides have marked the progress of the ice cream industry in the course of the last five years, and it is now one of the most active and progressive in America. The National Dairy Show offers an ideal opportunity for giving expression and showing the results of this wonderful spirit of improvement and expansion.

There is no better opportunity for all those interested — cattlemen, dairymen, jobbers, dealers, manufacturers, restaurant keepers, confectioners, retailers, the general public, and all others interested in dairy products and the epuipment for manufacturing them— to meet on common ground and learn from each other and the numerous displays, what new developments have taken place in the past year. It gives all visitors a chance to grasp, in the course of a few days, educational information covering the whole field, or any special division of it, which it might otherwise take weeks and months, perhaps even years of study, research and traveling to get. Buyers and sellers can transact business under ideal conditions for making comparisons and using good judgment in making all decisions.

The ice cream business has now reached the sound commercial basis of an established industry, and is at present showing an irresistable trend toward huge plants and large scale production. More improvements have been made in the last year in the equipment for manufacturing ice cream than in any other branch of the dairy industry. These are necessary that lower prices for ice cream may be established to stimulate business and help to make ice cream a more and more standard article of food. It is therefore of the utmost importance that ice cream manufacturers expecting to remain successful in the future must keep themselves informed about the new machinery and equipment in their line, that they may the better see to it that their plants are equipped with the most up-to-date labor saving devices, so they can easily meet price competition, fill all orders, and yet not lower the good quality of their product.

The Colonial Ice Cream Company, Philadelphia, have this season ordered altogether nine 160-quart giant freezers. Six have already been installed, and the other three will be added shortly. These machines represent the very latest in ice cream freezer construction, including Hyatt Roller Bearings and the Automatic Batch Control. This company is one of the most progressive in the country, and decided in favor of U. S. Heavy Duty Giant Freezers to replace smaller units only after thorough tests in actual service.

This year the U. S. Freezer and Machine Corporation will exhibit at the Show as in the past, and show at least three of the six- different sizes of freezers they manufacture, namely, the 40-quart Commercial, 60-quart Majestic and the 160-quart Giant. If possible, they will also show either a 50, 100 or 120 quart machine.

In the building of U. S. Heavy Duty Freezers, it has always been sought to produce a machine which is reliable, easy and convenient to handle in every respect, economical in power and saving in space; a machine that will multiply the productivity of labor, and does not require such skilled high priced labor to operate it as is ordinarily necessary. It can be had in any size necessary to fit each manufacturer's conditions from the largest ice cream freezer in the world (the 160-quart U. S. Heavy Duty Giant) to the regular 40-quart Commercial size.

The supreme importance of always turning out the finest texture and the correct overrun in ice cream has always been kept in mind.

The U. S. Freezer was a pioneer in the introduction of the automatic batch control and the hinged cylinder cover, (now standard equipment on all sizes), and it was the first to embody roller bearings. It is unique in its rapid vertical discharge, brine cooling system and control, and chargng arrangement.

Its new method of introducing fruits and flavors, its improvements towards making it easier to inspect the process of freezing, and the new type of automatic batch control and brine regulation are among some of the entirely new features that will be shown at the

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION.

Portland, Ore., Sept. 1, 1921.

Ice Cream Review:

I believe it is the duty of every ice cream manufacturer throughout the United States to partake of the different opportunities that are given to study and learn of the problems that are before them.

I am particularly interested in the shows that are put on by the National Association of Ice Cream Supply Men, and I should like very much to see them assembled with the National Association of Ice Cream Manufacturers and other affairs of this kind, so that they would in this way have one central location.

The advantage that we enjoyed from the exhibit of the National Association of Ice Cream Supply Men in this end of the country will last for many years to come.

I believe that too little attention is paid by the men who are engaged in this great industry, to the conventions, which deserve their most earnest consideration and thought, and should have their fullest support. I hope it is the most largely attended convention that has ever been held. I believe it is the most profitable vacation and investment that any man in this industry can give to himself or one of his employees.

Truthfully yours,

J. E. DUNNE, President.

WANT DEPARTMENT

Orders for this Department must reach our Office not later than the 10th of the month. Orders received after that date will be carried over to the following months issue.

"WANT" AND "FOR SALE"

Notices will be published at the rate of 2 cents per word, cash with order. For blind address 15 cents extra.

NOTE: Names and addresses of advertisers using blind address cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of "The Ice Cream Review."

NOTICE.

The Ice Cream Review disclaims any responsibility for the reliability of parties advertising in the Want and For Sale Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting any suspicious dealings to us at once.

HELP WANTED

Superintendent Wanted—Have position open for high class experienced man who is not only an expert ice cream maker and manager, but is also an expert caterer, and who can also qualify for responsible position of Superintendent of large ice cream department, includig fine catering work. City of 500,000 population. Address: R-53, Ice Cream Review. 9-21

SALESMAN WANTED—Who can sell machinery and supplies to creameries, dairies, ice cream makers and poultry dealers, no others need apply. N. A. Kennedy Supply Co., Kansas City, Mo. 9-21

SALESMAN WANTED—For flavoring extract specialties. Familiar with ice cream manufacturers, manufacturing confectioners, bakers, etc., in middle west territory. Salary and expenses. None but men familiar with this trade and territory need apply. Give full particulars to avoid unnecessary correspondence. Address: R-64, Ice Cream Review. 9-21

POSITION WANTED

HIGH GRADE ICE CREAM MAKER, capable all around dairyman, open for engagement. Thirty years' practical experience, expert on testing, standardizing, pasteurizing milk, cream. Thoroughly experienced in all departments inside, and outside work, steam, refrigeration; good mechanic; reliable; best of references. Will guarantee to save and make you money in your plant. Desire position with reliable firm. Address: R-48, Ice Cream Review. 7-21tf

POSITION WANTED—As an ice cream maker, superintendent or manager. Thoroughly competent to turn out first class product. Understand refrigerating machinery, emulcification, standardizing, pasteurizing and testing of ice cream mix. Can come on short notice. Please state salary and particulars in first letter. Address: R-52, Ice Cream Review. 9-21

POSITION WANTED—By an ice cream maker of 16 years' experience, who is capable of taking charge of the manufacturing department of any ice cream plant. Thoroughly understand all modern methods. Married and can furnish the best of references. Address: R-69, Ice Cream Review. 9-21

POSITION WANTED—Thorough knowledge in manufacture of all dairy products. 20 years' experience. Address: Edwin Hauk, 225 E. 55th Place, Chicago, Ill. 9-21

POSITION WANTED—By thoroughly experienced person who understands modern methods of ice cream making as superintendent or ice cream maker. Address: R-68, Ice Cream Review. 9-21

POSITION WANTED—Young man, college graduate, seventeen months' practical experience, at present foreman and assistant manager of ice cream factory, has twelve hundred dollars he desires to invest on profit-sharing basis in progressive ice cream plant or creamery where he may go to work also. Address: R-66, Ice Cream Review. 9-21

POSITION WANTED—As butter or ice cream maker or creamery and ice plant combined. At present foreman in up-to-date creamery. Not afraid of work. Single; age 25. Best of references. Three years present position. Good mechanic, do own repair work. Answering, describe plant and salary expecting to pay. Come twenty days' notice. West preferred. Address: R-57, Ice Cream Review. 9-21

FOR SALE BARGAINS

FOR SALE—Modern, newly equipped ice cream factory. Nearest competitor 70 miles. Just installing viscolizer and tubular cooler. Up to date in every way. Address: R-54, Ice Cream Review. 9-21

FOR SALE—Ice cream plant donig a 45,000 gallon business each year. Capacity 400 gallons per day. Two Miller Brine Freezers; Automatic Refrigerating Machine; 500 large tubs and cans; two trucks and everything necessary to run an up-to-date ice cream plant. Profits were $11,000.00 last year. Will sell right, if taken at once. Address: R-58, Ice Cream Review. 9-21

FOR SALE — One complete small ice cream plant, will sell whole or in part.

Two 200-gal. motor driven Davis-Watkins batch pasteurizers.

One 40-qt. belt driven direct expension freezer.

One 20-qt. belt driven C. & B. brine freezer.

One 5-ton Frick Compressors, together with condensors and coils for same.

One 10-H. P. direct current motor and starter.

One 2½-H. P. direct current motor starter.

One No. 4 Crese ice crusher.

One 1000-lb. milk cooler.

Address: P. O. Box 257, New Orleans, La. 9-21

FOR SALE—Up-to-date Ice Cream Factory in Oklahoma town of 7,000 population with two railroads to ship on; all machinery used one year; $8,000.00 outfit; will sell right if taken at once. Partners can't agree. Address: R-55, Ice Cream Review. 9-21

FOR SALE—A modern ice cream factory located in a good growing Texas town of about 11,000 and with three railroads. Daily average is over 200 gallons. Have $25,000.00 invested. Will sell; worth the money. Bad health reason for selling. Address: R-62, Ice Cream Review. 9-21

FOR SALE—A dairy and ice cream factory. A new plant, and there is room for ice making and cold storage. For further particulars, address: R-70, Ice Cream Review. 9-21

FOR SALE—A real business; small creamery and ice cream plant, in connection with a retail coal and ice business. All in a new concrete building, 32x52 feet, located in a southern Illinois town of 2500 population. Four ways out for shipping. I am an old man; I want to sell. Address: Grayville Coal & Ice Co., Grayville, Ill. 9-21

FOR SALE—Creamery business and equipment, in Pennsylvania city of 50,000. Selling weekly over 1,500 gallons of cream and homogenized ice cream mix. Low rent, good lease. Cash, $8,000. Address: R-67, Ice Cream Review. 9-21

FOR SALE—Three new Cherry model "I" 60-quart freezers; motor driven. Rich Ice Cream Co., Buffalo, N. Y. 3-21tf

MACHINERY AND SUPPLIES AND

BOILERS, NEW AND SECOND HAND—Electric Motors, Engines, Pumps, Pipes and fittings, Valves, Belting, Shafting, Bearings and Pulleys. Money Saving prices. Harris Machinery Co., Minneapolis, Minn. 12-20tf

FOR SALE—Cottage cheese in one, two or five tub lots, shipped date of make. Rock Lake Creamery, Lake Mills, Wis. 1-21tf

FOR SALE—One Cherry ice cream freezer, one ice crusher, one 8 H. P. motor, shaft and pulleys, $500 cash. Address: F. Wenzil, 3037 West 19th St., Chicago, Ill. 9-21

FOR SALE—One 3x2 CP concentrator. Good as new. In use only four months. $1,000 cash, F. O. B. St. Charles. No surplus, reason for selling. St. Charles Dairy Co., St. Charles, Mo. 9-21

FOR SALE—DeLaval No. 1 belt drive emulsor, capacity 200 gallons per hour. In excellent mechanical condition and will guarantee to do work satisfactorily. Price $225.00. The Gassmann Ice Cream Co., Olney, Ill. 9-21

FOR SALE—Perfect sanitary all metal vat, never used. Dual churn, No. 5, used about two months. Strain Bros., Lamar, Colo. 10-21

FOR SALE—3 80-qt. Miller motor drive freezers, equal to new; also all other makes of belt and motor drive freezers; two, three and five hundred gallon vats, 80, 200 and 400 gal. homogenizers; all at very attractive prices. Send for complete list. Philadelphia Retinning Co., North Philadelphia, Pa. 9-21

The Want Department of The Ice Cream Review is a market place for your used machinery; turn it into cash.

FOR SALE—In excellent condition, one 1000-gal. copper tinned Cherry ice cream batch mixer with direct connected A. C. 220-volt, 3-phase, 60-cycle motor. Immediate shipment. Address: Box 250, Elyria, O. 9-21tf

FOR SALE—One four-foot copper pan with two copper forewarmers. Equipment is in excellent condition and is a bargain for anyone who can use this outfit. Oatman Brothers, Inc., Aurora, Ill. 11-21

75-TON MOTOR DRIVEN ice machines, over 1 75-ton York horizontal refrigerating machine, motor driven, and 1 75-ton De La Vergne horizontal ice machine, motor driven, including high side. $18,000 for both machines loaded on cars; hardly been used. Charles S. Jacobowitz, 1382 Niagara St., Buffalo, N. Y. 9-21tf

FOR SALE—One York 35-ton refrigerating machine, 11½x15, steam driven, 16x15; one York 45-ton refrigerating machine, 12½x18, steam driven, 18x18; one Frick 30-ton refrigerating machine, 10½x18, steam driven, 15x18; one Frick 40-ton refrigerating machine, 12x20, steam driven, 18x20; one battery; two 125 H. P. water tube Erie boilers. I. N. Hagan Ice Cream Co., Uniontown, Pa. 10-21

The Olsen Publishing Company

Printers and Publishers

210 Sycamore Street

Milwaukee Wisconsin

FOR SALE—Owing to Camp Grant leaving Rockford, we offer for sale about 100 20-quart, galvanized iron brick cans. Cans are in good condition and we can make you a special low price by addressing: Allen Ice Cream Co., Rockford, Ill. 10-21

FOR SALE—Immediate shipment, ten-ton belted Creamery Package machine, with high side complete. One 8-ton Remmington belt driven refrigerating machine, with high side, complete. One 5-ton Baker refrigerating machine, with high side complete. These machines have been overhauled and are good as new at a very cheap price. W. C. Hardy, 1215 Filbert St., Philadelphia, Pa. 9-21tf

WANTED TO BUY

WANTED—Second hand butter tubs by the hundred or carlots. Address: Rock Lake Cry., Lake Mills, Wis. 1-21tf

WANTED TO BUY—Ice cream factory in Southern Illinois, preferably one doing shipping as well as local business. Describe equipment, location, and give price in replying. Address: R-51, Ice Cream Review. 9-21

WANTED TO BUY—Small ice cream factory in a live town, with good shipping facilities; must be cheap for spot cash. Address: R-64, Ice Cream Review. 9-21

WANTED—Ice cream, dairy and ice plant owners investigate new invention that has proven to be success. Your brine can be cooled down from 10 to 14 degrees colder after it has been used for ice cream freezing, cooling off milk or cream. This machine can be attached to your present refrigeration plant and it will not cost you any additional operating expenses. If you are having any trouble keeping your brine cold or other trouble with refrigeration plant, write me at once. Address: R 65, Ice Cream Review. 9-21tf

WANT TO HEAR from owner having ice cream or other business for sale. State cash price and particulars. John J. Black, Chippewa Falls, Wis. 10-21

GREAT EDUCATIONAL VALUE AS WELL AS BUSINESS OPPORTUNITIES OFFERED BY NATIONAL DAIRY SHOW.

(Continued from page 183)

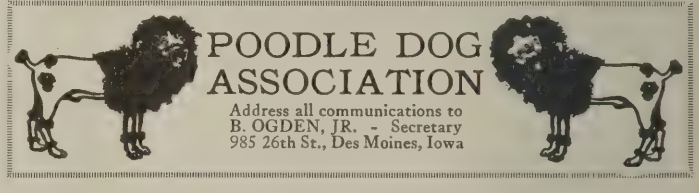
National Dairy Show for the first time, and represent some of the most striking advances made in the last year in ice cream freezer construction.

We are confident that the Dairy Show of this year will be the same great success that it has been in other years, and that all who attend it will feel that any expense incurred in connection therewith will be money well invested.

THE CARE OF LEATHER.

(Continued from page 182)

it. Never let the belt remain dirty or dusty overnight, nor leave an excess of grease or oil on it.



Belt Dressing. A good belt grease or dressing is one which gives the belt sufficient flexibility and at the same time causes it to cling to the pulley, but does not harness and liberally to work harness. Rub the oil or grease, warm to the hand, thoroughly into the leather while it is still damp from the washing. After the harness has hung in a warm room overnight, remove, with a clean, dry cloth, the excess of oil which the leather is unable to take up.

In case the oils and greases mentioned are too expensive or too difficult to obtain, they may be mixed with not more than an equal quantity of heavy mineral oil, petrolatum, or paraffine, or a mixture of these substances.[1] In no case, however, should any grease or other preparation containing mineral acids or oxalic acid be used on harness or belts. No matter how highly subsequently stiffen or injure the belt in any way. Among the best belt dressings are mixtures of cod and neat's-foot oils with tallow and wool grease, free from mineral acid.

Clean the belt well, especially on the pulley side, by washing it with warm water and a good neutral soap, such as castile or white toilet soap, and, if necessary, scrape it on the pulley side to remove dressing and dirt that may be caked on it. Wash rapidly, and do not permit the belt to become wet, as it will then stretch and slip. Dressings never should be allowed to cake on the belt because caking causes the belt to run unevenly and also injures it. The dressing should be liquid at ordinary temperature, should be applied to the outside of the belt while it is at rest, and should be allowed to soak in overnight. It should be applied very evenly and should be rubbed in with cotton waste, a piece of felt, or with some similar material. If absolutely necessary, a very light dressing may be applied to the pulley side of the belt, using cotton waste or felt lightly greased with the belt dressing. Even distribution and penetration should be secured as far as it is possible to do so. Avoid resin or greases containing resin. They weaken the belt and shorten its period of service. Do not use belt dressings excessively, as they will cause undue stretching and loss of grip. Belts should never look or feel greasy. They should never be more greasy than they were when installed.

Mildewing of Leather.

Any leather article is almost certain to mildew if kept in a warm, damp, and dark place, such as a closet, cellar, or stable. This mildewing probably will not reduce seriously the serviceability of the article, unless it is allowed to remain on the leather too long. It may, however, change the color appreciably, thus injuring the appearance. The simplest way to prevent mildewing is to keep the leather in a well-ventilated, dry well-lighted place, preferably one exposed to the sunlight. Mildew cannot make much headway in the sunshine. When mildew develops, it should be washed off with soap and warm water, or simply wiped off with a moist cloth, drying the leather well afterwards. These simple measures are preferable to the application in the home of preparations designed to prevent the growth of mildew.

To Members of Poodle Dog Association of Iowa:

The time for the National Convention at Minneapolis, Minn., is fast approaching and many members will be there.

In a recent conversation with Mr. W. S. Wilcox, President of the Association of Ice Cream Manufacturers of Iowa, he stated that most of the Iowa manufacturers will headquarter at the Hotel Dyckman. This affords an excellent opportunity for us to meet our old friends and customers, have a good fellowship meeting, and discuss our plans for the next State Convention to be held at Cedar Rapids.

Extensive plans are being made for the entertainment of the ladies and many Iowa manufacturers will be accompanied by their wives, so let us help to make their stay in Minneapolis as pleasant as possible. Come, and bring your wife.

Don't forget the dates — October 10, 11 and 12. Let's have a big attendance.

Trusting you have enjoyed a prosperous season, and with kindest personal regards, and hoping to see you in Minneapolis, I am,

G. H. BULGER,
President Poodle Dog Association.

Large New Catalog Coming

For Milk Dealers, Ice Cream Makers and Creamery Men

DURING the last year our General Advertising Department has been building a large comprehensive catalog in loose-leaf form. This is being used throughout our entire organization with such success that we have decided to issue it in book form about the first of January, 1922.

It will include more than three hundred pages of photographs-drawings, information and prices. It will show many pictures of Davis, Watkins Equipment in actual operation in milk plants, ice cream factories and creameries. It will illustrate and describe in detail the many machines constructed in our several factories. Also information as to how the most progressive men in the Dairy Industry do the work at low cost of operation.

This is a period of retrenchment. Not in the building of new plants, nor the purchasing of new machinery; but, in doing those things which must permit a reduction in the money spent in operating the "spread." Handling costs must come down. You can do this only in one way—by equipping and routing the work so as to shorten up the distance between cost and selling price.

That is what this NEW CATALOG is for—to help you plan your work; and handle it at low cost. To show you the modern automatic equipment which will handle your work at much less cost for labor, time and losses. To guide your selection of the machinery best fitted for your needs. To show you just how well equipped we are to give you a a SERVICE worth more than it costs.

We are now making up the mailing list for this NEW CATALOG. We want to know how many to print. If you think you can make good use of this book, write us on a postal card, or in a letter "Put my name down for NEW CATALOG"—sign your name, name of company, and address; and mail it to

OCTOBER 1921

BULLETIN OF EVENTS

Eastern Exposition, Association of Ice Cream Supply Men—At Elmwood Music Hall, Buffalo, N. Y., October 31st to November 5th, inclusive. Roberts Everett, Secretary, 1328 Broadway, New York City.

Association of Ice Cream Manufacturers of Pennsylvania—Fifteenth Annual Convention, Erie, Pa., October 31, November 1, 1921. Following the meeting Nov. 1st, the association will adjourn to Buffalo to inspect the Eastern Exhibition. J. W. Neuman, Secretary, care of H. L. Neuman Co., York, Pa.

Pacific Ice Cream Manufacturers Association—Annual Convention, Nov. 14, 15, 16, 1921, Seattle, Washington. Bert H. Walker, care of Royal Ice Cream Co., Tacoma, Wash., Secy.

West Virginia Association of Ice Cream Manufacturers—Annual Convention, at Wheeling, W. Va., November 21st and 22nd. C. F. Jamison, Huntington, W. Va., Secretary.

Southern Exhibition—Association of Ice Cream Supply Men, Auditorium Armory, Atlanta, Georgia, November 28-December 2, inclusive. Roberts Everett, Secretary, 1328 Broadway, New York City.

Southern Association of Ice Cream Manufacturers—Ninth annual convention, Atlanta, Georgia, Nov. 29, 30 and Dec. 1, 1921. J. W. Clopton, Decatur, Ala., Secretary.

North Carolina Ice Cream Manufacturers' Association—Annual Convention, at Atlanta, Ga., in connection with Southern Exhibition, November 28th to December 1st. Headquarters, Ansley Hotel. A. E. Dixon, Fayetteville, N. C., Secretary.

National Association of Practical Refrigerating Engineers—Twelfth Annual Convention, Hotel Lorraine, Philadelphia, Pa., November 30, December 1, 2, 3, 1921. Edward H. Fox. 5707 West Lake St., Chicago. Secretary.

Texas Ice Cream Manufacturers' Association—Fourteenth Annual Convention, Ft. Worth, Texas, December 7, 8, 9, 1921. Headquarters, Texas Hotel. H. F. Owsley, Dallas, Secretary.

Oklahoma Association of Ice Cream Manufacturers—Annual convention, Oklahoma City, Dec. 12-13-14, 1921. Secretary, M. T Cochran, Altus Ice Cream Co., Altus.

Kansas Association of Ice Cream Manufacturers—Annual Convention, Kansas City, Mo., December 15, 16, 1921. B. T. Perkins, Pittsburg, Secretary.

Louisiana Association of Ice Cream Manufacturers—Second Annual Convention, New Orleans, January, 1922. Newton F. Manning, Monroe, La., Secretary.

Michigan Allied Dairy Association—Annual Convention, in Municipal Auditorium at Saginaw. Tentative dates, Feb. 14, 15, 16, 17, 1922. H. D. Wendt, General Secretary, Lansing.

IN DEVOTING a considerable part of this issue of The Ice Cream Review to the Eastern Exposition, put on by the Association of Ice Cream Supply Men, we feel that we are not only giving our readers interesting information, but we are recognizing in our humble way a most worthy effort on the part of that association to serve a great industry.

The stage is set for the greatest meeting of its kind ever held in the east, and Buffalo will know that a bunch of live business men are in its midst October 31st to Nov. 5th, inclusive. Secretary Everett advises us that interest in the event insures the best meeting ever held and the ice cream man who fails to be there is going to miss more than he will be missed.

The ice cream supply man is playing a most important part in the development of the ice cream industry and the man in the business who does not realize this fact doesn't have a very clear understanding of what is going on. True, he is interested in developing his particular business, but who is not? Through his various organizations, state and national, he joins hands with others to boost everything that is for the good of the industry. We take off our hat to him.

NOT all of the profiteers in the retail ice cream business have been made to see the light. In most of the large cities they have been forced to lower their prices, but this applies only in a general way to the large retailers. In the outlying districts the retailer has been left to follow his inclinations along that line. In most cases he has been wise enough and honest enough to inaugurate lower prices.

There are exceptions, however. We encountered one of these exceptions the other evening right near home. We visited a nearby parlor and were astonished to note the war-time prices which still prevailed. We courteously asked the reason for such prices and were informed that "you don't have to buy anything here if you don't want to." In this we concurred and we didn't buy anything.

This parlor is near a public grade school and a high school. Most of the patronage is furnished by the children. There is a robber who makes a specialty of robbing children and he is getting away with it because most people choose to be robbed rather than to protest. If justice were done such a robber would be behind the bars instead of profiteering at the expense of school children. Some of these days we will have laws that will curb the operation of all robbers, whether they operate with a dark lantern or behind a soda fountain.

In the meantime the consumption of ice cream is not what it might be if fair retail prices were maintained everywhere. The manufacturer of ice cream suffers lower gallonage and the people have less ice cream to eat. All because of consciousless retailers who rob little children. Shame on them!

IN A RECENT number of confectionery magazine we find an idea that should be equally as applicable to ice cream as candy.. The suggestion was made to feature an attractive box of candy as a window display along side of a variety of regular printed calling cards, which might be obtained from your local printer, then having a neat card on the box of candy, which should be the conspicuous feature of the window display, read "Your Best Calling Card."

Surely a brick of ice cream is a welcome calling card, and the highly attractive appearance of present day ice cream packages should make a brick of ice cream an equally presentable calling card as a fancy box of candy.

Likewise can a window display be made attractive with ice cream cartons to stop passers-by and convey a desire to "take home that brick of ice cream." Now while the natural consumption of ice cream is on the down grade, can't the progressive ice cream manufacturer well afford to start a campaign among his dealers for competitive window displays embodying the foregoing idea?

⚜

DELEGATES to the Annual Convention in Minneapolis were treated to a wonderful talk by Prof. E. V. McCollum, of Johns Hopkins University, relative to the food value of dairy products. He told them some facts about their business which every ice cream manufacturer in the country should have heard. He didn't mince words at all and we will take pleasure in publishing his address in a subsequent issue.

He frankly told the ice cream manufacturers that he was going about the country extolling the superior virtues of dairy products as human food, but he was not saying very much about ice cream. He let them understand that until they put the emphasis on quality in making ice cream he could not conscientiously give it his unqualified endorsement. By inference at least he let them understand that, in his opinion, too many manufacturers are trying to see how cheaply they can make ice cream, instead of trying to see how good they can make it. We wish that more could have heard this remarkable address.

⚜

THERE are altogether too many ice cream manufacturers who are satisfied with making money during a few weeks or months of the year. They concentrate all their efforts on getting a big gallonage during the summertime and then let the business "go to pot" the rest of the year.

By their actions they assist the consumers to reach the conclusion that ice cream is a hot weather confection instead of a food. They take it for granted that their customers don't want ice cream except during the hot weather, when they should go and tell their customers what they are missing by not making ice cream a regular item of food purchases for the family table all the year round.

THE Ice Cream Review will be in evidence at the Buffalo Exposition, and we hope to feel better acquainted at the close than at the beginning of the big doings. The business end of our organization has sent out an S. O. S. call to the editorial department for help and it has fallen to our lot to be at the Buffalo meeting in person—and undisguised as far as Nature has permitted. The Review editor will be there and hopes to meet every reader. Please call around at our booth and introduce yourself. We are a bit bashful—that's why we make such hard work of an editor's job—and we will appreciate it if you will come around and help mess up our headquarters. We want to get acquainted.

⚜

ONE could not fail to be impressed by the spirit of progress which prevailed at the annual convention. Serious minded folks were in quest of information and methods which will further advance their industry. True, they had a good time, but they were there for a different purpose. It was a great convention and will result in greater things for the association and the individual member.

⚜

EX-PRESIDENT MARTIN retires with the respect and admiration of every member. To have served such an association so well is an honor to which any man may well aspire.

⚜

IN THIS issue of The Ice Cream Review are printed a number of the addresses delivered at the convention of the National Association of Ice Cream Manufacturers. Other addresses and discussions following will be published in later issues.

⚜

JUDGING from gossip at the Dairy Show, the boys in Dixie are going to put on the biggest convention ever held in the South. Keep your eye on Atlanta.

Known bondholders, mortgage and other security holders, holding 1 per cent or more of total amount of bonds, mortgages, or other securities,—None.

Signed, H. P. Olsen, Manager.

Sworn to and subscribed before me this 16th day of September, 1921.

C. J. Linden, Notary Public, Milwaukee Co., Wis.

(My commission expires February 1st, 1925.)

NOTE:—This statement is made in duplicate, both copies to be delivered to the postmaster, who will send one copy to the third Assistant Postmaster General (Division of Classification), Washington, D. C., and retain the other in the files of the post office. The publisher must publish a copy of this statement in the second issue printed next after its filing.

Eastern Exhibition---1921's Mecca for the Progressive Ice Cream Manufacturer

WHAT the automobile shows in Chicago and New York are to the automobile industry, what the annual exhibition of the railway equipment makers means to the railway builders and operators of the world, what the Dairy Show is to the producers of milk, the Eastern Exhibition of The Association of Ice Cream Supply Men in Buffalo, opening the last day of this month, is to the ice cream industry of the United States and Canada—its industry's greatest expositional event.

The Eastern Exhibition this year will be the biggest that the Association of Ice Cream Supply Men ever has managed. It is expected to have the greatest attendance ever recorded. Coming at the close of a season that has been marked by strenuous efforts toward plant economies and general operating and sales readjustments this exhibition has a potential value for the ice cream manufacturers within fourty-eight hours ride of Buffalo that can safely be termed incalculable.

There are few ice cream manufacturers in the country who do not know something about the exhibitions promoted and managed by The Association of Ice Cream Supply Men. These exhibitions assemble beneath a single roof for five or six successive days every product and service that an ice cream manufacturer needs. From an architect's blue prints for an entire new factory down to the smallest piece of metal equipment needed in it, the visitor to one of these exhibitions can inspect his present or future needs. The newest freezers, vats, mixing aparatus, are all there. Sales services are arrayed for inspection. Every variety of packaging and shipping apparatus, motor trucks, refrigerated bodies, tubs, cabinets, cans, salt, milk, sugar, gelatine, extracts, fruits, hardening room eqiupment, moulds, paints, cleaning specialties, essential oils, fittings, floorings, gums, improvers, laboratory equipment, tools, specialties, etc., etc., are there to be examined and compared and tested. Every variety of machinery employed in an ice cream plant is displayed. In fact everything used in, around or in any way connected with the operation of a plant is included in the comprehensive expositions of the industry which the national supply men manage.

It is the greatest of any of these exhibitions that is to open in Buffalo Oct. 31st and to close Nov. 5th.

"Will Promote Economies," Says President Jordan.

That it will be not merely the biggest in size but also in dollars-and-cents value to those who visit it is the opinion of O. S. Jordan, President of The Association of Ice Cream Supply Men, who believes that it will be seen, in looking back in after months, to have held greater importance to the industry than any other exhibition that has ever been assembled because of the peculiar value held this year of anything tending toward rock bottom in management and processes.

"The great value of the Eastern Exhibition this year," according to Mr. Jordan, "is in the opportunity it gives the owners and executives of 700 or 800 different plants to visualize their next year's problems in a physical way in advance of their peak season. Everything at the Eastern Exhibition will be tangible, demonstrable, and that is what is needed now. There will be not merely the ideas there that have been evolved by many able minds, but the physical accessories and expressions of these ideas will be right there too, to touch, to inspect, to compare and valuate. Manufacturers interested in greater production or in getting their present production more economically can actually go over everything employed for that purpose, from one end to another. With condition of reconstruction existing throughout the country as they do end with ice cream competition tending naturally all the time to become more scientific, the owners of plants need an oppor-

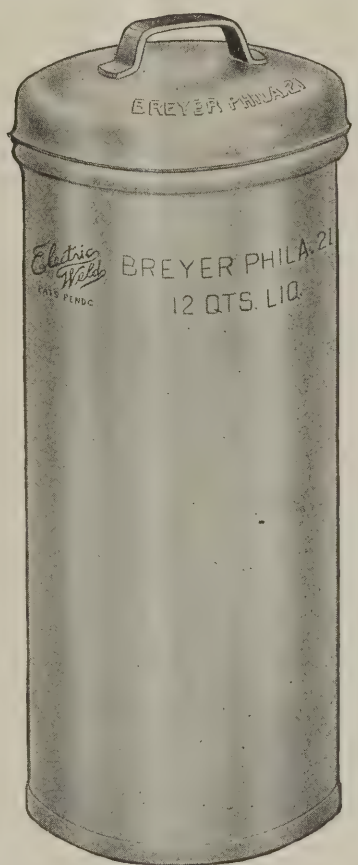
FOR A GREATER ICE CREAM INDUSTRY—Eastern Exhibition, Buffalo, October 31st - November 5th, inclusive.

WRITE FOR NEW LOW PRICES



NO Solder Electric Weld NO Rivets

Trade Mark, Registered

"Low Maintenance Cost" Ice Cream Cans
The Weight is in The Plate—All Steel and Tin

The Electric Weld GUARANTEE

1. That no solder, lead or rivets are used in the construction of Electric Weld Ice Cream Cans.
2. That all Electric Weld cans are made of a specially prepared copper-bearing, rust-resisting steel known as "tinning" or "dairy plate" and made of the same gauge material as specified in our advertising.
3. That all welds, being subjected to hammer and pressure tests, are sound and will not crack, break, leak or come apart.
4. That the can is completely assembled in the black before tinning and that it is coated by soaking the entire can in one piece in pure "straits" tin by the old-style hand dip, triple coating process.
5. That Electric Weld cans are of exact capacity and that each can is carefully examined and stamped by our Inspection and Test Department before shipping.

Patent Allowed.

The Electric Weld Ice Cream Can.

The Retinning Feature

Electric Weld Ice Cream Cans may be retinned over and over again at small cost. They are made complete in the black, leak-proof and ready for long service. Every time you retin an Electric Weld you can save approximately 30 cents. Write for prices, list of "Repeat order buyers" and other data pertaining to the **Solderless Can.**

The Non-Deforming Lid

Non-deforming edge keeps the lid round. THE RIM: One-piece expanded bead rim reinforces and protects the can from hard knocks and affords a positive grip for wet, slippery hands. SEAM: Butt welded, solid fusion of the joint that will not crack, break or leak. BOTTOM: A solid flanged leak proof bottom for hard wear and tear. No interstices or rolled edges to collect dirt. Affords a fine grip. Easy to clean. The strongest as well as the most sanitary bottom, three thicknesses soundly welded and solderless.

In 1920 the Horton Ice Cream Co., of New York, bought 2000; in 1921 a repeat order called for 5000 more. In 1920 the Breyer Ice Cream Co. of Philadelphia, Pa., bought 14,000; in 1921, 10,000. In 1920, Colonial Ice Cream Co., Philadelphia, Pa., 1000; in 1921, 30,000. Proof of quality and service in a nut shell.

tunity to get down to actual physical facts, as these represent manufacturing and merchandising development, and this exhibition is just that opportunity and one that can exist in no other way for them.

"With 150 booths leased in the Elmwood Music Hall and with more than 100 makers of equipment, machinery, supplies and services ready to install displays the Buffalo exhibition will offer in greater variety than ever before the essentials of ice cream manufacture. Numbers of elaborate machinery displays have been prepared, among others. The companies which will have exhibits include among them practically all of the best known supply houses in the country."

The 700 or 800 ice cream manufacturers referred to by Mr. Jordan are expected, on the basis of attendance at previous exhibitions, to register at the Buffalo show from at least twenty-five different states and Canada, and to represent 700 or 800 different ice cream manufacturing enterprises in that territory. Altogether an attendance of well over 1,000 persons is anticipated and Buffalo hotels already have reserved nearly all their available rooms for the week.

The annual convention of the Pennsylvania Association of Ice Cream Manufacturers will be held in Erie, Pa., a short journey only from Buffalo, October 31st and November 1st and its members will adjourn to visit the show in Buffalo in a body on the latter day. An attendance equally widely representative of the various states is expected from New England, New York, New Jersey, Delaware, Maryland, West Virginia, Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa and at least a dozen other states and Canadian provinces.

The site of the exhibition, the Elmwood Music Hall, is at Virginia street and Elmwood avenue in Buffalo. Just outside the active business center of the city, set among trees and attractive buildings and yet within a six-minute ride of the principal hotels and within a ten-minute walk of the Lafayette, the official hotel headquarters for the week. It is the building used throughout the winter for important concerts and civic entertainments and is one of the best conditioned buildings in the United States for the holding of a large exhibition, being ideally lighted, spacious and attractive.

Elmwood Music Hall, Buffalo, N. Y.

In this connection the exhibition management has announced that its decorative plans provide for a combination of color tones and specially arranged exhibition properties that will be in keeping with the nature of ice cream as a product that is pleasing to the eye and suggestive of a definite yet insubstantial daintiness.

In addition to the Lafayette Hotel which will house several hundred ice cream manufacturers and supply men, the hotels Statler and Iroquois have each made many reservations for visitors to the exhibition.

Diversified entertainment will be at hand for all who register at the show, informal social activities hav-

The Association of Ice Cream Supply Men---A Record of Constructive Work Well Done

THERE is not an ice cream manufacturer in the country today, probably, who does not know about the activities of The Association of Ice Cream Supply Men. This trade organization has accomplished so much during the last two years that it is really a justice done to the history of the industry to put together, in as permanent a form as a monthly publication can offer, a brief review of what it is and what it has accomplished.

It is a national organization of the allied trades upon which the ice cream manufacturing industry is dependent for its machinery, equipment, supplies and special services. It embraces such a diversity of interests as the makers of refrigeration equipment, the great salt mines, tubs and cabinets, the motor truck manufacturers and the makers of refrigerated truck bodies, architects, nationally-known merchandising experts, special counselors in advertising, flavor producers from the owners of California fruit groves to the importers of rare oriental gums, sanitary paper products manufacturers, the greatest gelatine producers of America and, through importers, those of Europe also, manufacturers of chemical cleansers and detergents, manufacturers of glass enameled vats, makers of steel cans, makers and producers of milk and the manufacturers of powdered milk and powdered cream, paint and varnish manufacturers, and other houses lending still greater variety to the combined products of its members.

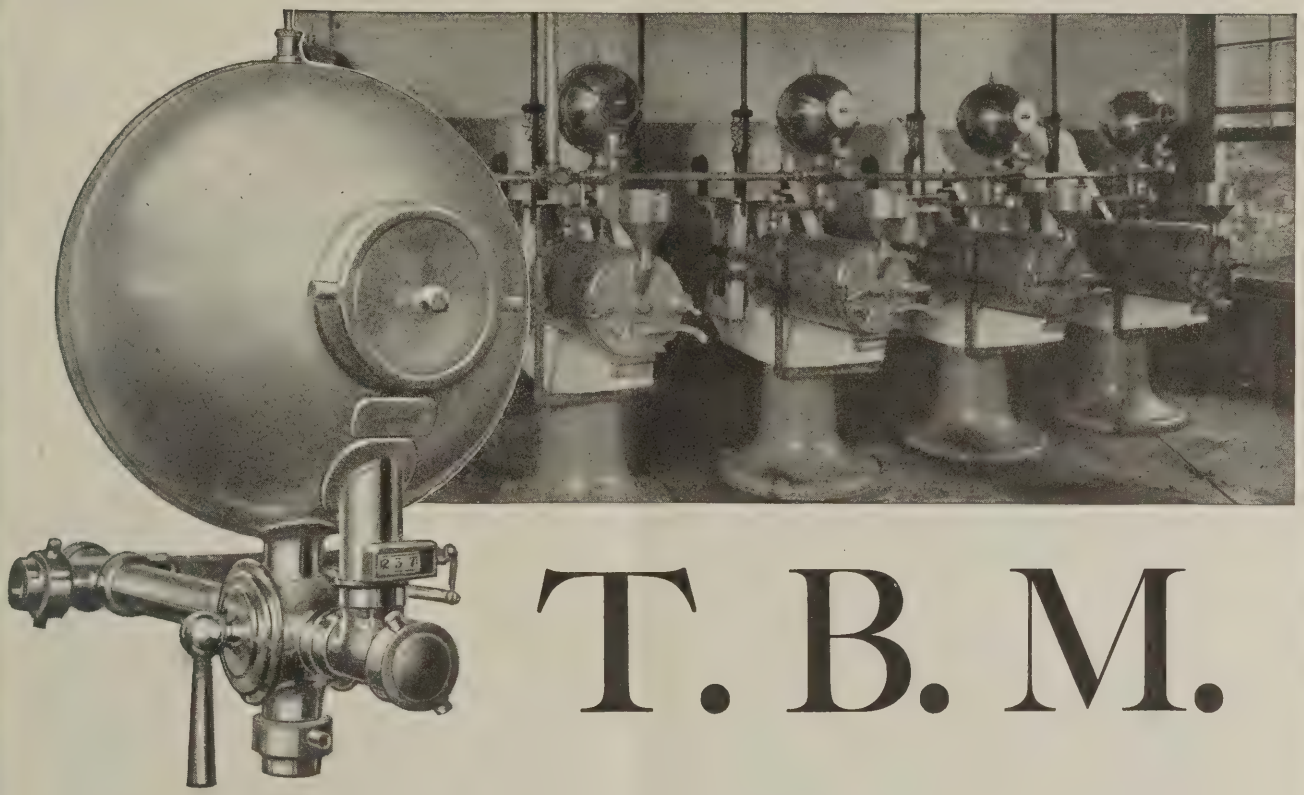
O. S. Jordan, President, Assn. of Ice Cream Supply Men.

This organization, with its amusing diversity of products and interests brings to a common purpose—that of intensive service to and development of the ice cream industry—a combination of industrial knowledge and aggressive habit perhaps unequaled in any other large industrial association in the country.

It has been in existence in its present form two and one half years. That short time has been long enough to attract to it the attention of many of the important industrial figures of the country. Its distinctive policies and purposes and the progressive manner in which these have been pursued explain the eminent place it holds today.

Few Americans—and this can be said of many of those Americans who are engaged in it—know the real romance of the ice cream industry. Oliver S. Jordan, President of The Association of Ice Cream Supply Men, recently referred to it as "that industry peculiarly American—as American as Bunker Hill or the Monroe Doctrine". Ice cream as it is known today is entirely an American product and the appetite of the American for it is seemingly as characteristically national as is his love for baseball or his election night parade. No other nation takes instinctively to ice cream as does the American. The children of no other lands naturally smack their lips at sight of the frozen delicacy which every American youngster knows as part of its heritage of youthful delights. Ice cream is literally an American confection.

But the romance does not lay wholly in the national character of ice cream. The story of the ice cream industry is a romance as great as any that business has ever known. Within the memory of men still in their thirties' the commercial ice cream of the country was largely sold on small dishes by hand purveyors on the streets.



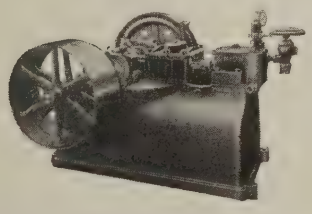
Yet today ice cream plants are among the show places of the largest cities. There are several $5,000,000 or greater ice cream manufacturing corporations. Every man, woman and child in the United States eats an average of more than three gallons of ice cream in a year. Ice cream is served at presidential banquets; it is eaten by the lowliest of Americans. It is sold from palatial retail stores in the fashionable sections of every city, and no mining camp in the Rockies is too far from civilization to have the cook serve ice cream for dessert. From investments of a few scattered thousand dollars, the industry has grown to represent producing investments of over $300,000,000. This year alone the ice cream manufacturers of America will pay out more than $200,000,000 in merchandise and labor bills.

Devoted to an industry with a history so unique and with potentialities so great, The Association of Ice Cream Supply Men in its comparatively short existence has accomplished many things. Its nation-wide, intelligently planned and persistently carried out work has been punctuated, as it were, by important industrial exhibitions in Philadelphia, St. Louis, Atlantic City and Portland, Ore., and will soon be further so accentuated this year by an eastern exhibition in Buffalo the latter part of this month and by a southern exhibition in Atlanta the week of November 28th, which latter will be devoted to the interests of the ice cream manufacturers of the South. These industrial exhibitions, important as they are, however, are accentuations only of an aggressive undertaking pursued week after week throughout the year—a work of industrial development which is constantly eliciting from many sources, some of them not even indirectly concerned in the ice cream industry, such comments as, ". . . you are doing much more active constructive work than most associations of this kind", "from what we have heard the ice cream supply men have one of the most aggressive wide-awake organizations that exist", ". . . we want to say that we are heartily in sympathy with such aggressive methods", ". . . the Association is a great help to the whole ice cream industry", ". . . . we certainly commend you on your constructive efforts".

No description of the Association of Ice Cream Supply Men and its unique standing in the world of organized industrial betterment would be complete without a consideration of its remarkable Code of Fair Practices. Believing that it could hasten the growth of the ice cream industry in no one surer way than by making it as nearly impossible as might be for ice cream man-

FOR A GREATER ICE CREAM INDUSTRY—Eastern Exhibition, Buffalo, October 31st - November 5th, inclusive.

THE C-B CALENDAR



T. B. M.

T. B. M. stands for the successful Thomas Batch Measures, and Thomas Batch Measures stand for **economy, accuracy,** and **cleanliness** in the freezer room.

In just a few years from today the rows of round, nickel plated T. B. Ms mounted on freezers will be as customary a sight as brine freezers themselves now are. Ice cream manufacturers everywhere are rapidly installing them. Why? Because it doesn't take very long for **ice cream** manufacturers to adopt a proven time saver and waste preventer. And these new Batch Measures have clearly demonstrated at least one interesting and important fact: no brine freezer, regardless of make, can be run at maximum efficiency without a Thomas Batch Measure.

Thomas Batch Measures are not expensive. They may be bought with new freezers, and if the costs of the old time batch tanks are deducted, it will bring the total costs of the freezers only slightly higher than if ordered without them. And, too, first costs are insignificant compared with the saving in labor, mix, flavoring and operating time, accomplished by using these Batch Measures.

Directors of Eastern Distribution for the Viscolizer

To get the whole story send for our new booklet. It shows a number of installations, explains just how a T. B. M. works, and tells what some representative users think of the attachment on their freezers. Find out what it will cost to equip your freezer room with them. No obligations incurred. Send for the booklet and quotations. Note: State the size and make of your freezers.

CHERRY-BASSETT COMPANY

PHILADELPHIA BALTIMORE

ufacturers to stand losses in equipment purchased, the Association unanimously adopted a Code of Fair Practices which has been described by prominent industrial experts as the ultimate expression of a real conscience in business, and which has been used as a model in several other industries for the drawing up of similar codes of fair commercial dealings. So remarkable is this Fair Practices Code in its expression of "Let the buyer be protected" spirit that the business press of the country has given much voluntary attention to it. Any violation of the Code by a member of the Association results in that member's expulsion.

The Code is in two sections, the first relating to dealings as between buyer and buyer and the second to dealings of competitor as against competitor, and is as follows:

Part of the Floor of the First Eastern Exhibition in 1919.

SECTION I.

1—Misbranding of articles as regards the materials or ingredients of which they are composed, their quality, their method or place of manufacture or origin: "inferential" misbranding, i. e., using trade names or descriptive terms which stimulate trade names or descriptive terms of unadulterated or geniune goods.

2—Bribery of buyers or other employees of customers, with the payment of specified percentages of purchase price of all goods bought, with money, presents, excessive treats, etc., to obtain new business or to induce the continuance of patronage.

3—Commercial bribery of customers by money, long term credits not in keeping with trade custom, excessive entertaining or any other means.

4—False or misleading advertising concerning prices, advertiser's status as a manufacturer, methods employed in the advertiser's business, false claims to Government or other endorsements, etc., or any advertising, printed, written or oral that comes within the definition of "undesirable advertising" laid down by the National Association of Ice Cream Manufacturers.

5—Trade boycotts or combinations of traders to prevent buyers from obtaining goods through customary channels.

6—Sale of rebuilt articles as new products.

7—"Leader" selling—i. e., selling one piece of goods at less than cost and recouping on others sold at the same time.

8—Making up and disseminating false cost sheets.

9—"Lottery" premiums—i. e., giving or offering premiums of unequal value, the receipt of any particular premium to be determined by lot or chance.

10—Discrimination in prices between different purchasers or different localities, based upon other than legitimate cost, sales and delivery considerations.

11—Selling food, or a product to be put into food, which, because of its nature or method of manufacture, or for any other reason, violates a local, state or federal ordinance or law.

12—Consigning unordered goods to a possible buyer, with the hope that they will be used and paid for.

13—Distribution of samples of a better grade than the product they are supposed to represent.

14—Any wilful misrepresentation as to market conditions or supply, either as to finished products or raw materials, tending to induce buyers to overbuy their requirements or contract for future deliveries to their plain loss or disadvantage.

SECTION II.

1—Bribery of customer's employees to introduce foreign substances into a competitor's goods already purchased.

2—Tampering with or misadjusting goods sold by a competitor, for the purpose of discrediting him with a customer.

3—Bribery of competitor's employees or spying on competitor's plant, trailing of competitor's delivery and sales agents, bribing railroad employees for information about competitor's shipments, stealing or copying competitor's blueprints, or any other means to the end of procuring a competitor's business or trade secrets.

4—Procuring breach, withdrawal or delay of competitor's contracts with customers by misrepresentation or by any other means.

5—Inducing competitor's employees to leave in such numbers as to disorganize, hamper or embarrass a business.

6—Making false or disparaging statements, either written or oral, respecting a competitor's products, selling prices, business, financial or personal standing, etc.

7—Threats of suits of patent infringement for selling or using alleged infringing products of a competitor, unless such threats are made in good faith.

8—Threatening to sue a competitor for the purpose of intimidation.

9—False claims to patents or misrepresentation of the scope of patents.

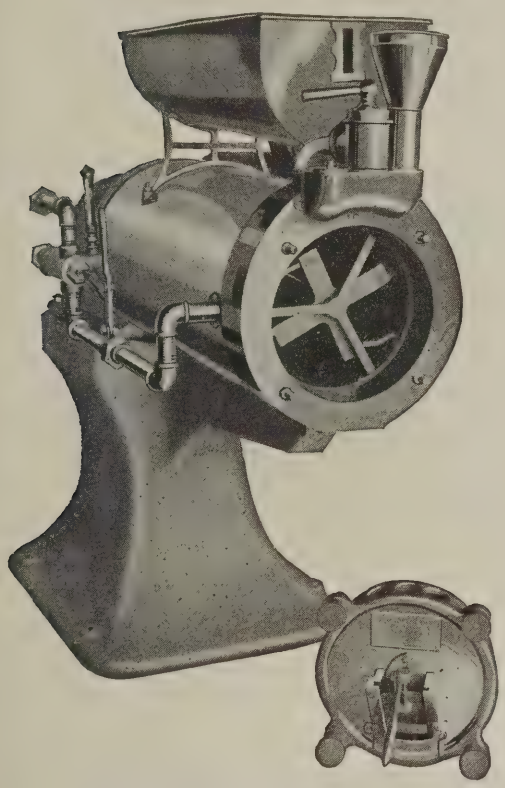
The Buyer's Page

Standard Equipment for Ice Cream Plants



Immediate Shipment from Chicago or St. Paul

Creasey Ice Breaker

Every manufacturer of ice cream, large or small, needs this sturdy machine. Built over-size throughout—stands up under hardest service you can give it.

The size of the broken ice can be regulated by the use of fine or coarse combs—furnished with each machine—which prevent passage of the ice until it is broken to a certain fineness. This is a special feature, and one of great value. Picks are easily removed from drum when necessary, but they cannot become detached when in operation. No rivet heads or bolts or nuts to work loose.

More than 16,000 Creasey Breakers in use; why not put one to work in YOUR plant?

U. S. Brine Freezer

A large capacity freezer, heavily built throughout, with ample bearings and large gears. Furnished for either belt or motor drive, or can be converted from one to the other in your own factory when desired. Electric machine equipped with 3 H. P. motor.

The hinged cylinder cover is standard on all sizes of U. S. Freezers; makes them quickly accessible for cleaning. The brine jacket passages are designed for the greatest efficiency in cooling the cylinder and arranged to avoid all clogging and stopping. The brine flow is controlled by a valve of special design which gives complete control of the rapidity of the freezing process.

U. S. Freezers are made in 40, 60, 80, 100, 120, and 160 quart capacities; there is a size that will exactly meet your needs.

A handsome and practical machine that will pay for itself repeatedly in your plant. Let us give you further details and prices.

Have You This Catalog?

It is one of the most complete catalogs of ice cream machinery and supplies ever published. You will find between its covers the best of the things made by many of America's leading manufacturers —a valuable book for reference. We'll gladly send you copy on request —without obligation.

Buffalo, "Queen City of the Lakes"

ICE cream manufacturers and members of the Association of Ice Cream Supply Men who attend the Eastern Exhibition at Buffalo, which will be held October 31 to November 5, inclusive, will see on every hand the material evidences of the great strides which Buffalo, at the eastern gateway of the Great Lakes, and the western terminus of the new barge canal, has made in the opening years of the twentieth century. This will be the first time this association has held an exhibition in the Queen City-of-the-Lakes, and those who remember Buffalo at some previous time will be astonished at its progress and development.

Niagara Falls from American and Luna Falls.

Ice cream men will find comfortable hotel accommodations awaiting them, of which the city is justly proud, because they are equal to the best in the world in appointments and service. Both European and American plans are represented, and visitors have a wide choice in rooms and locations; comfort at little cost, and luxury at modest prices. Rates for rooms are fixed and never are increased because of the presence of a convention in this city. Among the more prominent hotels are the Statler, Iroquois, Lafayette, Genesee, Broezel and Touraine.

Buffalo's convenient location, unexcelled facilities and attractions have made it one of the great exhibition and convention cities of the United States. Buffalo being accessible to more than half the people of the United States and Canada in twelvehours, or less. For this travel there are the fastest and best equipped trains of the great trunk lines, no less than seventeen railway systems entering the city, and in summer the added facilities of ten steamship lines, which bring many thousands of convention visitors and tourists to Buffalo.

In summer and autumn Buffalo is a paradise for the automobilist. Buffalo leads in asphalt paved streets, and in addition there are many miles of beautifully macadamized parkways, connecting a splendid system of public parks. In Delaware Park, the largest of the city's recreation grounds, are located the Albright Art Gallery, one of the finest examples of Grecian architecture in America, the white marble building of the Historical Society, a zoo, a casino, green houses and other buildings. Provision is made in Buffalo's parks for the lover of outdoor sports, including baseball, golf, lawn tennis and lawn bowling. They are intended for the use of all people and "Keep Off the Grass" signs are not used.

At the front is a splendid view of lake and river, and in the distance suggestions of Buffalo's greatness as a commercial and manufacturing city. Many children find delight in the wading pool at Humboldt Park. An unsurpassed collection of rare plants and flowers is housed in the great botanical garden in South Park. In each of the larger parks there is a band pavilion and free daily concerts are given by the Park band.

Many millions of dollars have been spent by New York State in the improvement of highways, and Erie county, in which Buffalo is located, has co-operated and contributed liberally for the creation of good roads in this section, with the result that brick and macadam roadways radiate in all directions far into the country, and to the east, across the state. One of these improved roadways connect Buffalo with Niagara Falls, practically a suburb of this city, and an objective point for thousands of tourists who never tire of witnessing the majesty and grandeur of the cataracts and the wonderful gorge and rapids below. Niagara Falls also is accessible from Buffalo by train or trolley, with frequent and rapid service.

While advancing their material interests the people of Buffalo and city officials always have considered the social needs of the community, and this city always has been among the leaders in this service. The first organized charity work in America was begun by the Charity Organization Society, which still exists. The first, or one of the first public bath houses in the United States was established by the City of Buffalo. Buffalo is amply provided with public and private hospitals, and in the past few years has co-operated in the war against the white plague. The city has built and maintains at Perrysburg, in the hills to the southwest of the city, a splendid hospital for the treatment and care of both adults and children suffering from incipi-

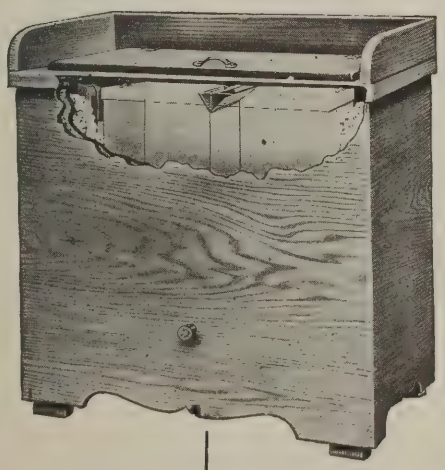
Nelson (Patented Ice Cream Cabinets

"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"



C. Nelson Brick Cabinet
Patented May 8, 1906

Three Compartment Cabinet

42 Qt. Brick Cabinet with Ice Rail

Patented Nov. 11, 1919—1321120

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Plan on your season's requirements now, and have your supply on hand when needed.

C. Nelson Manufacturing Co.

2308 Division St. **St. Louis, Mo.**

ent tuberculosis. Contracts have been let for a million dollar hospital for those in advanced stages of this scourge. Altogether there are more than one hundred agencies and institutions in Buffalo for the care, treatment and maintenance of the unfortunate and misguided. These matters have received the careful attention of the Chamber of Commerce, and through the activities of its Charities Bureau fake solicitors have been practically driven out of town, and much waste prevented.

With her growing iron and steel industries, and hundred of other stable and established manufacturing plants, Buffalo affords steady and remunerative employment to a great army of workingmen, and at the same time every facility for a most comfortable living.

It is not a city of tenements, the few existing being vigorously regulated, and many hundreds of the city's workingmen are comfortably housed in their own cottages, with an abundance of air and light, and usually a lawn and garden.

Since the beginning of the present century, the system of instruction in the public schools of this city has been extended to include training in arts and crafts, so that the children are no longer taught solely to become clerks or bookkeepers, but if they wish they have the opportunity of learning the fundamental principles of a number of valuable trades. Nor have the girls been overlooked in this improved training, and they are taught cooking, sewing and domestic science.

Aside from all of her material advantages, natural and acquired, Buffalo regards as her greatest asset the loyalty and enthusiasm of her citizens.

EASTERN EXHIBITION—1921's MECCA FOR THE PROGRESSIVE MANUFACTURER

(Concluded from Page 8)

ing become a recognized feature of the industrial shows held by the Association of Ice Cream Supply Men. A definite entertainment program will not be announced until shortly before the exhibition opens, however.

The exhibition will not be open evenings except that on one evening it is planned to invite the public of Buffalo to inspect the displays in order that it may gain a true idea of the magnitude and scientific progress of the industry. The exhibit will close on Saturday, November 5th.

The Association of Ice Cream Supply Men has not restricted exhibition privileges at Buffalo to its own membership but has extended them to non-member houses with goods or services of value to the industry. Among exhibitors will be the following individuals and firms:

WILL EXHIBIT AT BUFFALO

Davis-Watkins Dairymen's Mfg. Co., along with the many other progressive supporters of the big show, will exhibit their Progress Ice Cream Equipment at the Buffalo Exposition.

Marking the Progress of the Ice Cream Industry

The Association of Ice Cream Supply Men

Previous "supplymen's exhibitions" have brought home, to attending ice cream manufacturers a most comprehensive understanding of this association's service to the ice cream industry. These exhibitions are "not merely selling shows," but rather regarded as educational, inspirational and broadening, reflecting the spirit back of The Association of Ice Cream Supply Men—that of furthering the progress of the industry. It will pay you well to attend.

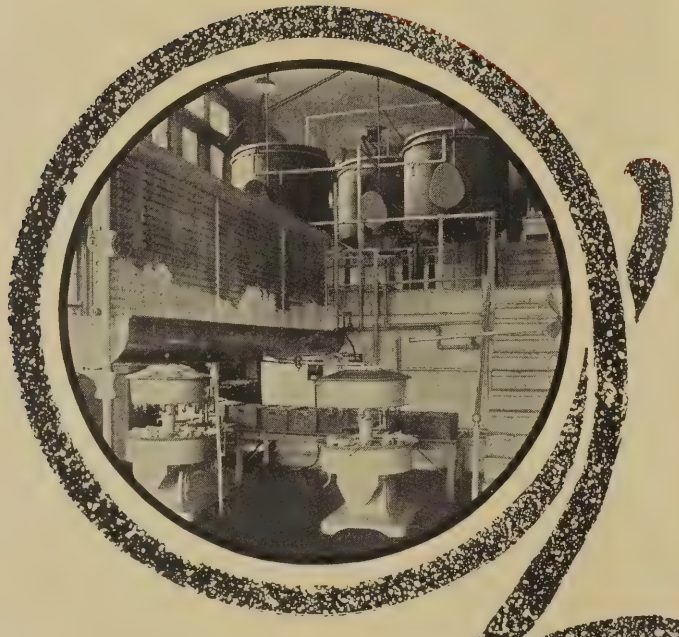
See our exhibit and meet our representatives at the Eastern Exhibition of the Association of Ice Cream Supply Men, Buffalo, N. Y., Oct. 31st to Nov. 5th.

Up-to-date-ness!—

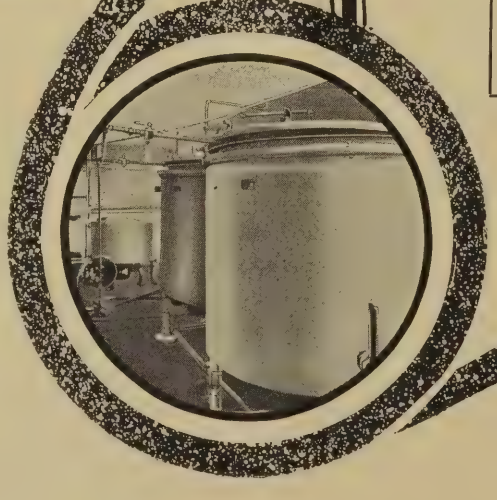
Up-to-date-ness has more than merely the fashionable idea attached to it now-a-days—this is one angle, of course, but we have the *greatest* respect for the man who will be among the *first* to change his methods, when he really sees a chance for improvement, (despite what his competitors may be doing.) This usually results in his making up the expenditure involved by a new increase in trade.

Look around you!—and see what your neighbors are doing. Are they buying new equipment? If they are, then for competitive reasons you, too, should buy.



If they are NOT—then here is a wonderful chance for you to get in ahead. Remember, that with your price remaining level every fraction of a cent per unit of production that you are able to reduce your costs, will mean additional profit for you without charging your customer any more.

Pasteurization, for example, is one of the items which many dairymen have sought to avoid as an expensive overhead which netted them nothing. The Pfaudler Company has proved the fallacy of any such attitude and, on the basis of showing economies gained has sold a very considerable number of its pasteurizers within the last few months. We are sincere in our belief that we have the best pasteurizer on the market and have prepared a limited edition of a booklet—"Pasteurization." This will tell you about the new Pfaudler Pasteurizer, and the manner in which it simplifies the process of pasteurization, making it a comparatively inexpensive operation.



Fill in and mail this coupon.

Pfaudler Glass Lined Pasteurizers—Sanitary Milk Products Co., Indianapolis. This company is well satisfied with their Pfaudler Pasteurizers, as is indicated by the following quotation from one of their letters recently received: "Wish to advise that the three 500-gal. Pfaudler Pasteurizers have been installed since June 15, 1921, and we are very much pleased with them. We believe the flavor of the milk is much better since using your tanks, also the bacterial count is much lower; we also find them to be labor savers."

Pfaudler Glass Lined Pasteurizers—Sanitary Milk and Ice Cream Co., Peru, Ind. Quoting a recent letter from the above: "We wish to remark that we are highly pleased with the tanks, as they are satisfactory in every way."

ACKNOWLEDGMENT IS DUE

Editor Ice Cream Review:

It is customary at all times to give proper credit wherever credit is due. The practice of claiming credit for something which someone else has done is manifested in all lines of activity more or less. Priority of publication of an article representing considerable study and experimentation is usually sufficient evidence as to who should receive credit for the work. The use of such an article once before published and presenting it at another time by someone else without crediting the author of the same, is, in the professional world considered not only very discourteous but apparent stealing of a commodity.

In the July 1920 issue of the Ice Cream Review was published an article entitled "Should Gelatine be Pasteurized with the Ice Cream Mix or Added After the Mix is Pasteurized", by Professor A. D. Burke, Oklahoma A. & M. College. On page 94 of the June 1921 issue of the Ice Cream Review appeared the same article word for word, purporting to have been an address delivered by John T. Cunningham of Chicago, before the Illinois Convention of Ice Cream Manufacturers, 1920.

It is evident that many readers of the Review have the impression that Mr. Cunningham was the author of the paper. Mr. Cunningham has refused to sign an acknowledgment and apology to Professor Burke and I believe that the readers of the Review should understand the situation. The following is the note of apology which Mr. Cunningham was asked to sign and publish: "Apologies to Professor A. D. Burke:

On page 94 of the June 1921 issue of the Ice Cream Review appeared a paper entitled "Should Gelatine Be Pasteurized With the Ice Cream Mix or Added After the Mix Has Been Pasteurized." This is a paper which I presented to the Illinois Ice Cream Maker's Association Convention and it undoubtedly has appeared to the readers of the Review that I personally am the author of this paper. This same paper was published word for word in the July 1920 issue of the Review by the author of this paper, Professor A. D. Burke, Oklahoma A. & M. College, Stillwater, Oklahoma. I desire to offer my apologies to Professor Burke for presenting this paper at the Illinois Convention without the proper acknowledgment of it's source and without mentioning the author of the paper.

SIGNED————————"

Yours truly,

A. C. BAER,

Professor of Dairying and Dairy Husbandry
Oklahoma Agri. & Mech. College,
Stillwater, Okla.

WILL MAKE ICE CREAM FOR VINTON

The Bryan-Leverich Motor Co. sold their new brick building on West Fourth street to the Hutchinson Ice Cream Co., of Cedar Rapids.

The purchase of this building by the Cedar Rapids company means a new industry for Vinton, Ia. They expect to establish an ice cream factory which will be in operation by the first of October, or a little later. Several thousand dollars worth of machinery will be installed for handling the milk and cream and making the frozen delicacies for which this company is noted.

The building purchased by the Hutchinson company is ideally constructed for their line of business and is conveniently located.

"DOC" Advises Users to Run Germ-X Through Entire System

Dear Customer:

A large number of the users are running a Germ-X solution through the entire system of their plant after cleaning. Those who do this are receiving no complaints about spoiled, moldy or off-flavored products. Their plant is sterile and sweet smelling.

Simply make a Germ-X solution—one ounce of concentrated Germ-X to one gallon of water—and run it through all equipment, pipe lines, etc., just as you run your milk or cream.

P. S. We have recently issued an instructive folder on the use of Germ-X. Send for it and we'll also send you a free sample.

"DOC" GERM-X.

Why the Compressor Loses Capacity When Operating on Brine and Hardening Room

A Practical Talk by a Representative of the Baker Ice Machine Company of Omaha, Nebraska

THE proper design of the refrigerating equipment for the ice cream manufacturer necessitates a very careful study on the part of the refrigerating engineer. This is true also of the design of plants for creameries and dairies. But when ice cream duty and cream or milk cooling duties are combined extraordinary care must be exercised in the selection of the ammonia compressor and in the design of the expansion side of the equipment, so that the work may be performed in the most economical and satisfactory manner.

We will assume that the reader is familiar with practical refrigerating methods as ordinarily applied to each of the above classes of service, independently, so that we will confine our remarks to the points which must be considered when applying mechanical refrigeration to these various services combined.

Of foremost consideration is the extremes in temperatures required, ranging from zero degrees Fahrenheit in the hardening room to 25 degrees brine for cream and milk cooling.

In order to secure a temperature of zero degrees in the hardening room the temperature of vaporization of the ammonia should be about twenty degrees below zero. This cannot be obtained unless the vaporization pressure or suction pressure is about 3 pounds gauge.

On the other hand 25 degrees brine is ordinarily obtained with 15 degrees ammonia, which represents a suction pressure of about 28 pounds gauge.

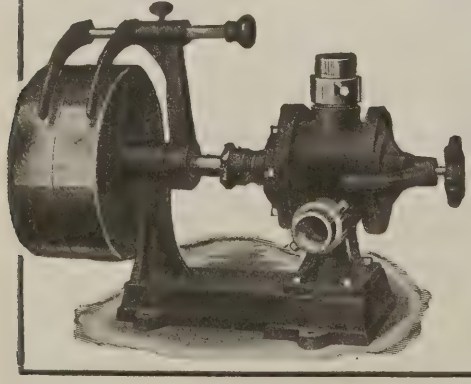
A knowledge of the relation of ammonia pressures and temperatures is very essential to a thorough understanding of the workings of the machine. Frequently we hear an engineer complain that he cannot hold his hardening room temperature down while his compressor is working on the brine. This is due to the fact that the suction pressure has been raised above the pressure, corresponding to the temperature at which the ammonia will evaporate. As a result the liquid ammonia lays in the coils of the hardening room without doing work until the temperature raises sufficiently to evaporate it, or until the suction pressure has been again reduced.

In plants having two compressors—one machine can be operated on the low pressure work and the other on the high pressure work. But small plants have one compressor only and the hardening room work and cream or milk cooling duties cannot be economically performed at the same time, unless the compressor is fitted with two independent suction lines which can be operated at different suction pressures.

Of next importance is the relation of suction pressure to the capacity of the ammonia compressor.

All compressors are rated at 15.6 pounds suction pressure and 185 pounds discharge pressure. We cannot expect a compressor operating at 3 pounds suction pressure to deliver more than 58% of its rated capacity, while at 28 pounds suction pressure it should deliver 142% of its rated capacity.

A ten ton machine, for example, operating with 3 pounds suction pressure on milk or cream cooling duty and trying to hold hardening room at the same time could not deliver more than 5.8 tons of refrigeration in 24 hours. The same machine would be able to deliver 14½ tons refrigeration on the milk and cream duty.



These facts demonstrate clearly why it is that a compressor originally installed to perform work on high suction pressures (20 to 25 lbs.) is incapable of taking care of low temperature work in addition. The low temperature work may require only a small percentage of the capacity of the machine, but it cuts the possible tonnage of the compressor about 40%.

The Baker Ice Machine Company has taken care of this feature in a most practicable way. They have made special provisions in the construction of their compressors enabling them to attach a double suction arm with valve between, which makes it possible to operate the cylinders at different suction pressures. By this arrangement, extremely low temperatures can be maintained with one cylinder, and high temperatures can be maintained with the other, without the consequent loss of efficiency incident to the entire operation at low pressure, thereby getting full rated capacity from the compressor. This arrangement also permits throwing the two cylinders on either the low temperature or the high temperature work at the discretion of the operator.

It serves the functions of two compressors, and for the ordinary creamery or dairy that is engaged also in the ice cream business this arrangement is ideal.

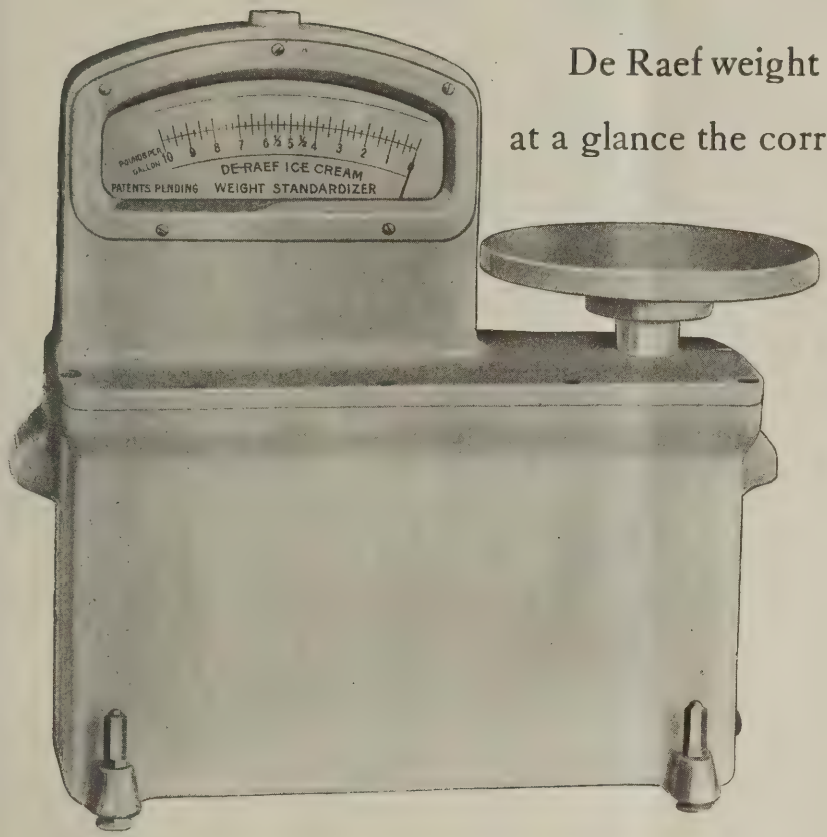
The Baker Ice Machine Company will have an Exhibit at the National Dairy Show and will be pleased to receive their friends and parties interested in Dairying products.

Taber Creamery Pumps

are the most sanitary because they are entirely dissectable. Demand a Taber Pump from your jobber. If he cannot supply you we will sell you direct. Address:

Taber Pump Company
297 Elm Street
BUFFALO, N. Y.

FOR YOUR PARTY.



Of course ice cream is served at all parties! In fact, it is that very course which is awaited most eagerly during the repast, as least, by the fair sex, (and since prohibition, we think we can vouch the same for the "opposites").

At a recent party, ice cream was served in a manner both unique and attractive and we are going to pass it on to our readers so that their wives and sweethearts may try it at their next party.

Take the allotted number of small flower pots, and after a thorough scrubbing, line each one with waxed paper and pack with ice cream. Then, to represent the earth, grated chocolate is thickly sprinkled on top, and a gay flower on a stem is stuck into the "earth". This will be a real ice cream surprise held in a flower pot.

Standardization of Ice Cream

By Weight Per Unit Volume

De Raef weight standardizer tells you at a glance the correct weight per gallon, while the ice cream is still in the freezer, giving the ice cream maker full control of a standard weight per gallon as well as a given over-run.

No weights—no charts—no counter balances —no telescopic cups — no adjustments — no magnifying glass to read dial—no figuring—always ready for operator—water proof and rust proof.

Works automatically—reading can be made ten feet away—large black figures on white dial. Will give correct weight per gallon of ice cream, regardless of weight per gallon of mix.

De Raef Ice Cream Weight Standardizer circular sent on application to the Ice Cream Department

SERVICE—NOT JUST EQUIPMENT

A One-Floor Ice Cream Plant that Saves Space and Reduces Cost

A FEATURE of Elyria Equipment installations is the compactness of plant layout and consequent ability to save valuable floor space and overhead room which can be devoted to other purposes. ¶The Elyria units in the Hayes Ice Cream Plant [illustrated above] consist of two 1000-gallon storage and aging tanks and one 500-gallon mixing tank—all direct connected under one continuous operating system with the freezers—a plan which eliminates rehandling and assures rapid, uninterrupted flow of materials. ¶Elyria Engineers are specialists in designing just such plants as this. They can recommend for your approval a layout which will give you maximum daily output with minimum use of floor space, labor and time. ¶And, they will prove to you the advisability of using Elyria Glass Enameled Steel Equipment because it is the most thoroughly and most scientifically constructed equipment in its class.

Economy

Elyria Glass Enameled Steel Equipment is easily cleaned and kept clean; it will not crack or chip; it neither gives flavor to or takes flavor from the product. Its use heightens the general efficiency of the plant.

The mechanical improvements of Elyria Tanks and the systems under which they are installed guarantee continuous maximum production with minimum cost. Elyria Engineers will prove this to you.

You will be interested in having complete information on Elyria Equipment—mixers, storage tanks, weight tanks, pasteurizers and etc., for the Milk and Ice Cream Plant. A letter will bring proof of Elyria superiority at once.

Condensed and Evaporated Milk Market Report

By Bureau of Markets and Crop Estimates, U. S. Department of Agriculture.

Manufacturers Wholesale Selling Prices of Condensed and Evaporated Milk (September)

The wholesale prices given below are based on reports made by manufacturers covering actual sales of condensed and evaporated milk to jobbers, wholesale grocers and similar buyers, delivered at manufacturers' distributing points on basis of cash or short time credit. Foreign prices are given as F. O. B., or F. A. S., points of export in section in which sales were made.

MOVEMENT OF EVAPORATED MILK MUCH HEAVIER THAN CONDENSED MILK.

The most noticeable feature revealed by a review of the latest available reports from milk manufacturers is the activity in the movement of unsweetened evaporated stocks as compared with sweetened condensed during the past month. Business in the former class of goods was of much more satisfactory volume than the latter, and the tone of the market correspondingly better. This applies to case goods primarily, as the approach of cooler weather has naturally reduced the demand for bulk goods, especially from the ice cream trade.

Manufacturers' reports of total stocks on hand Sept. 1 indicated approximately the same surplus of condensed case goods as the previous month, but show a notable decrease in the quantities of evaporated case goods of over 35 per cent. The same comparison holds with reference to unsold stocks also, condensed case goods being practically the same as August 1, while unsold stocks of evaporated case goods September 1 were almost 50 per cent lower. Stocks of both classes of case goods were less than half of those reported a year ago.

The export movement during August apparently served to give considerable relief to the situation. As will be noted from the accompanying figures, exports of evaporated milk more than doubled those of July, amounting to 22,803,000 lbs. Exports of condensed milk were but 7,557,000 lbs., although this was 2,000,000 lbs. heavier than July. The United Kingdom received 12,716,000 lbs. of evaporated and 3,232,000 lbs. of condensed, thus ranking as the country to which by far the heaviest shipments were made. France and Germany received approximately 3,000,000 lbs. each of evaporated milk, but aside from these countries mentioned no unusual shipments appear to have been made. It is of interest to note that during the first eight months of 1921 exports of condensed milk were but 62,000,000 lbs. compared with over 221,000,000 lbs. during the same period in 1920, while exports of evaporated milk this year amounting to 116,000,000 lbs., are some 5,000,000 lbs. heavier than 1920.

Manufacturers' selling prices to domestic trade during August remained practically the same as during July, but reductions occurred in prices to foreign trade. The greatest cuts were made in prices of sweetened condensed which averaged 34c lower per case. Unsweetened evaporated prices to foreign trade were not so generally reduced by all manufacturers, as some seem to have advanced these prices slightly with the result that the average was but 4c less per case.

No Wonder They Smile!

—for ice cream stabilized by ESSEX Gelatine looks as delicious and wholesome as it invariably proves to be. No separation of fats from the milk and its water content—hence perfect digestibility and no ice splinters.

Your customers will wish their friends to try an ice cream that is uniform; pure; smooth as the cream it is made from!

NEW PLANT NEARLY COMPLETED

Water mains and plumbing have been put in the building and floors are laid, so that with the installation of the heating system, the factory of the Berlin Ice Cream and Dairy Products Company, Berlin, Wis., will be practically complete. The company does not plan to move the machinery from its present location into the new building until next year.

"It would interfere too much with our current business if we were to transfer the machinery now," said Frank Feiner, Secretary. "Our decision is to remain in our present location until the colder months when the volume of business is less, and then to move the machinery and begin in the new factory. The West side building will be painted white during the spring, and with machinery and other necessities installed, we will be ready to manufacture ice cream and dairy products in the most sanitary way possible."

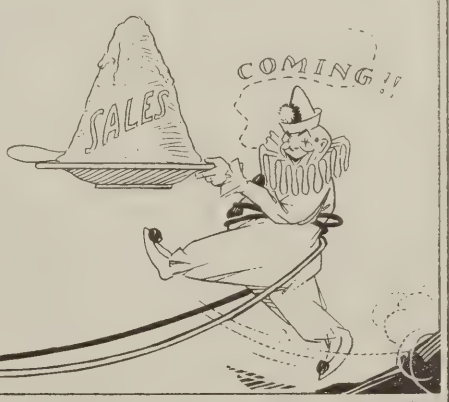
The volume of business transacted by the company has increased greatly since the inception of the local ice firm.

Don't miss a single copy of The Ice Cream Review. We'll see that you do not if you send us two dollars for a year's subscription.

What Sells One Brand Over Another?

Taste?—Yes
Advertising?—Yes

——But the advertising that sells depends on **newness** in art and message.



New Ideas—that's the problem!

It's only natural for the dealers to prefer to handle the ice cream whose manufacturer backs it up with original advertising ideas.

And the dealer finds his selling immensely easier when the decorations in his store and his windows connect up in the public's mind with the advertisements they have seen on the poster boards, in the street cars, and in the newspapers.

The problem, of course, is to originate the ideas and plan the campaign that will make the dealer yield to the demand for **your** ice cream. That is where the Nordhem Company, as a specialist in ice cream advertising, will assist you.

Nordhem Service originates sales-producing ideas.

Why not talk over your advertising questions with the Nordhem representative at the convention?

Stricter Regulations in Ohio

STRICT enforcement of the new code of rules and regulations provided in the new Kryder ice cream bill will take place in the future, according to reports from Columbus.

The regulations are as follows:

SANITARY CODE AND REGULATIONS FOR ICE CREAM MANUFACTURERS

Re-Amended Substitute Senate Bill No. 105

1. All ice cream shall be made from fresh sweet cream and dairy products and shall not contain fats other than dairy or milk fats nor more than one-half of one per cent, of vegetable gum and shall be composed entirely in accordance with Re-Amended Substitute Senate Bill No. 105.

2. All work rooms shall be thoroughly cleaned and free from dust, dirt and contamination and debris of every kind and character, including unused tools, utensils and apparatus; shall be well lighted and well ventilated. Basements shall not be used for workrooms unless these provisions can be met.

3. Garbage and all waste material subject to decomposition must be removed daily to the outside and deposited in a can provided exclusively for this purpose, composed of impervious material and provided with a tight fitting cover. Covers must be kept on the cans at all times except when entering or removing the material.

4. The sidewalls and ceilings of all work-rooms shall be well plastered, tiled or wainscoted or ceiled with metal or lumber and shall be well painted to the end that they may be readily cleaned and they shall be kept free from dust, dirt and foreign matter.

5. The floors of all work rooms shall be impermeable and be made of cement, tile laid in cement, or other suitable non-absorbent material which can be flushed and washed clean with water. Floors shall be sloped to one or more drains which must be properly connected to the sewerage system.

6. Doors, windows and other openings of every work room shall be screened during the fly season with screens not coarser than 14 mesh wire gauge.

7. All factories or shops shall have convenient toilet rooms, separate and apart from the work rooms, and no toilet rooms shall be within or connected directly with a work room, either by a door, window or other opening. The floors of the toilet room shall be of cement, tile or other non-absorbent material, and shall be kept clean at all times. Toilet rooms shall be furnished with separate ventilating flues or pipes discharging into soil pipes or on the outside of the building in which they are situated. Lavatories and wash rooms shall be adjacent to toilet rooms and shall be supplied with soap, water and clean towels and shall be maintained in a sanitary condition. Work room employees before beginning work and after visiting toilet rooms shall wash their hands and arms thoroughly in clean water.

8. No person shall live or sleep in any building used as a factory or shop, unless the factory or shop is separated by impervious walls, without doors or windows or other openings from the parts of the building used for living or sleeping purposes. No horses, cows or other animals shall be stabled or kept in any building where ice cream is made, unless the factory or shop is separated from the places where the horses, cows or other animals are stabled or kept by impervious walls without doors, windows or other openings.

9. No person suffering from or afflicted with tuberculosis, a venereal or contagious disease, shall be employed in or about any part of an ice cream factory and to this end the proprietor or manager of any ice cream factory shall require him or her to handle or come in contact with any material used in such ice cream or the product thereof, to furnish a certificate from a reputable physician showing him or her to be free from any infectious or contagious disease.

10. All work room employees shall be clean in person at all times and shall wear clean washable clothing and caps. They shall not smoke nor chew tobacco while at work. They shall not touch the product with their hands at any time. Employees may be specially designated to cut and wrap brick ice cream and to fill fancy moulds and as this work necessitates some handling of the product, such employees must be scrupulously clean and wear clean, washable clothing and caps.

11. All wagons, trucks, drays, cans and tubs, platforms and racks, shall be constructed that they may readily be cleaned and they shall be kept clean. Utensils must be of smooth non-absorbent material, as tin, or tinned copper, the seams of which are flushed smooth with solder. Freezers, vats, cans, mixing cans or tanks, piping and all utensils used as containers for ice cream or raw material, and all tools used in the making or the direct handling of ice cream shall be thoroughly cleansed after use with hot water and sterilized with steam or other sterilizing agent.

12. Soft or melted ice cream or any other ice cream shall not be refrozen under any circumstances.

13. Store and storage rooms for materials must be kept clean and free from objectionable odors. Decomposed, decayed, fermented, contaminated or rancid material shall not be used.

14. All cans, packers or receptacles used in the manufacture, transportation or storage of ice cream must be free from dents and rust and must be properly tinned inside and the use of liners for ice cream packers is hereby discouraged.

15. All creamery and condensory operators, ice cream manufacturers and all other dealers in milk and cream, and their customers must cleanse all receptacles used in shipping milk, cream or ice cream as soon as they are emptied in order to prevent the development of dangerous bacteria to threaten the health of the consumers of the product. No person shall use any vessel used in the manufacture and sale of ice cream for any other purpose.

CONDENSED MILK MACHINERY

The Better Kind

We teach you to make condensed milk.

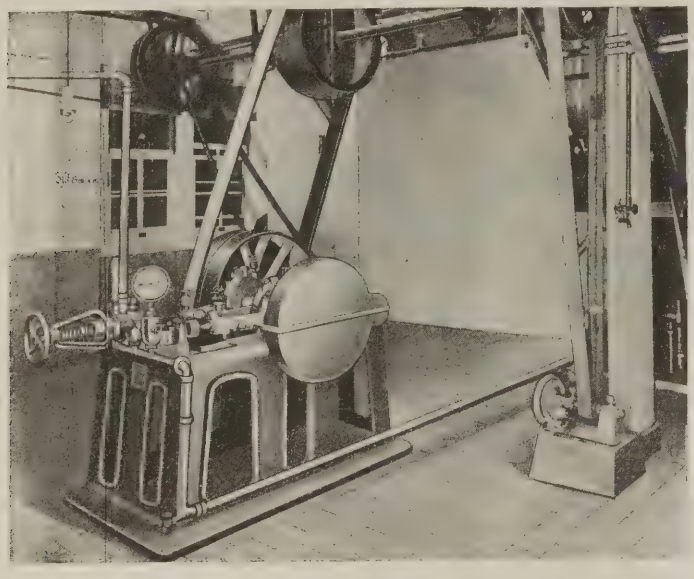
Builders of Better Condensing Equipment

8731 Witt St. Detroit, Mich.

MANY manufacturers are spending thousands of dollars each year for signs, bill boards, window trims, newspaper space and general advertising. This money in most cases is well invested because it helps your sales force get new stops.

However the value of this advertising is lessened unless your ice cream is so uniformly good that your customers can distinguish your ice cream from your competitors' when they taste it.

C. W. Brand Vanilla will improve your present mix to such a degree that your customers will easily be able to taste the difference.



The consumer will go past one store to buy ice cream at another if the other man's ice cream tastes better.

The Widlar Company of Cleveland, Ohio who manufacture C. W. Brand Vanilla will be glad to show you that your ice cream can really be made to taste better.

CALIFORNIA PLANT USES HOMOGENIZER.

It is quite certain Californians consume as much ice cream per capita as is consumed by the inhabitants of any other state. For this reason an ice cream business in California is a pretty fine investment.

There is but one "fly in the ointment". Competition is exceedingly strong. But many of the ice cream manufacturers there have found out, as have Marshall Field in the departmest store business, Cadillac in the automobile business and the leaders in other lines, that nothing pays like quality goods—nothing gives complete assurance of growing and permanent success as the public knowledge that this or that particular concern manufactures the best goods obtainable.

A Gaulin Homogenizer Installed in Plant of Peerless Ice Cream Co., Sacramento, Calif.

One of the California ice cream makers that recognized the business building value of quality ice cream was the Peerless Ice Cream Co., at Sacramento, Cal.

This concern always prided itself on the excellence of its product. They found it difficult to make a product that was always free from graininess and always had as rich a taste as the quality of the mix deserved. The trouble, they discovered, was because their product was not homogenized. Furthermore, they found that the best procedure was to homogenize the whole mix at a pressure of from 3000 to 3500 pounds. To make a long story short, they ordered a Gaulin homogenizer.

Since the installation of the Gaulin, their business has grown by leaps and bounds and they expect it to grow for many years to come.

NATIONAL ASSOCIATION OF PRACTICAL REFRIGERATING ENGINEERS

The twelfth annual convention of the National Association of Practical Refrigerating Engineers will be held at Hotel Lorraine, Philadelphia, Pa., on November 30 and December 1, 2 and 3, 1921. This is the first meeting of the Association to be held in the East, and it is confidently expected that it will eclipse any previous gathering of refrigerating engineers, even the successful convention which the Association held at Chicago last December.

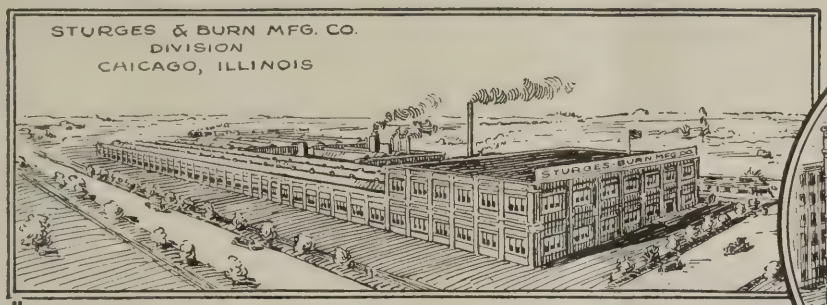
The gratifying growth of the Association during the past few years, with its membership representing every section, and almost every state in the Union, makes it reasonable to expect a record attendance, and anticipating this the committees in charge of the convention arrangements are making preparations on a greater scale than ever before.

The program to be provided will include papers by men of world-wide reputation, who are being chosen because of their familiarity with the particular subjects in which the membership, and refrigerating engineers in general, are interested. Also, there will be papers of interest to all groups of the refrigerating industry, including the employers and managers who will be welcome to attend as visitors. Each year is showing an increase in the number of plant owners and plant managers who attend the sessions of the convention. They are commencing to realize that during the few short days the Convention is in session they can obtain most valuable information as to plant operation. Along the same line of reasoning, many employers are making a practice of sending their engineers to these annual meetings. They have learned that it is a good investment.

The Educational and Examining Board of the National Association of Practical Refrigerating Engineers has recently had prepared under its supervision a Lecture Course on "The Principles of Refrigeration", in twenty parts, for the benefit of its members. Starting with Lacture No. 1, the Course is sent to them at intervals of two weeks. It is the most valuable work on that important subject thus far contributed, and the Board is to be highly commended upon the results of its efforts.

Refrigerating engineers who are not now members of the Association would do well to write the National Secretary, Mr. Edward H. Fox, 5707 West Lake St., Chicago, for information, with a view to joining and availing themselves of the educational work it is carrying on, including the Lecture Course.

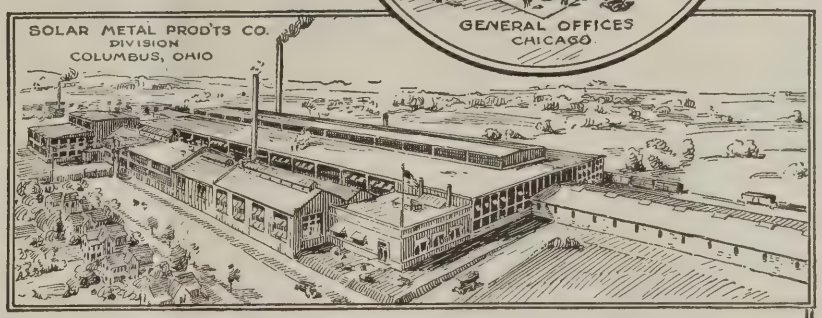
ICE CREAM REPORT FROM M. T. COCHRAN.



Mr. M. T. Cochran, secretary of the Oklahoma Association of Ice Cream Manufacturers, sends in the following report:

"The weather for July and August was ideal for the ice cream men, and all plants heard from report a nice business. Some report an increase over 1920, while others report around 70 per cent output. Taking the state as a whole, do not believe that the output will be as large as 1920."

WILL OPERATE IN BUTTER AND ICE CREAM



Tomahawk, Wis. — The Tomahawk Co-operative Dairy company has sold its creamery to A. A. Searl of Tomahawk and Joe Levin of Chicago, who will operate a first class creamery and ice cream factory.

Improved Service, Enhanced Quality and Lower Prices

ENAMELS

BRICK SLABS

TWO factories—one, at Chicago, The Sturges & Burn Mfg. Co., the world's largest makers of milk cans; the other, at Columbus, Ohio, The Solar Metal Products Co., Inc., leaders in the manufacture of ice cream cans—are now working under one management, the Solar-Sturges Mfg. Co.

ICE CREAM TUBS

The bringing together of the manufacturing equipments, the skilled managers and workers, the accumulated experience and knowledge, and other advantages, results in an organization through which can be offered to old and new friends and customers—better service—better quality—better prices. To this aim the new company is dedicated.

BRICK TANKS

We invite correspondence and extend invitations to visit our offices and factories at all times. If you attend the National Dairy Show at St. Paul, October 8th to 15th, we will welcome your visiting our booths Nos. 114-115-124-125 and 102.

THE MANNING-TAIT CAN STRAIGHTENER.

The Manning-Tait can straightener was invented by Mr. Harry Tait, of the well known firm of Tait Brothers, ice cream manufacturers and milk dealers of Springfield, Mass., after considerable experiment to perfect an apparatus that would take all the dents out of cans, especially the small dents that are nearly always found near the bottom hoop and the hook at the neck of the can.

Mr. Tait was granted a patent on this machine on June 26, 1917, and assigned his right, title and interest in the invention to the Manning Manufacturing Co., of Rutland, Vt., as manufacturers.

In 1917 and previously the milk dealers bought their milk by measure instead of weight, and many of them lost money because of dented cans, which would not hold full measure. A badly dented can could not honestly be passed by any sealer of weights and measures. Milk dealers realize that a dented can cannot be washed absolutely clean because only the high spots are reached. This fact has made the Manning-Tait can straightener very popular in milk plants. It is necessary for cans to be straightened before they can be successfully retinned. The majority of the largest retinning concerns in the country have used Manning-Tait can straighteners ever since they were first introduced. One large firm has 25 of these useful machines in use.

Mr. Tait and other milk dealers and can manufacturers experimented with pressure rolls and other devices and came to the conclusion that such apparatus would not take all the dents out of the cans although it would take out the large dents and restore the cans to their original shape. Mr. Tait, however, devised a machine which would do the work and do it well. A bronze hammer operating against an anvil conforming to the true diameter of the can will straighten cans with astonishing accuracy. This is the principle on which the Manning-Tait can straightener is constructed.

A great deal of experimenting was necessary to develop the proper curves for the hammers and anvils and to regulate the power of the blow to best perform the work, but the perfected machine takes the dents out no matter how large or small they are. It also makes the cans absolutely smooth to conform to their true capacity. The hammer strikes 250 blows a minute, so it is apparent that cans are straightened quickly—the exact speed depending of course upon the condition of the cans. The machine is built for either pulley or direct connected motor drive.

Several of the original can straighteners invented by Mr. Tait are still in use in the Tait Brothers plants throughout New England and their use has spread to all parts of the country.

CENSUS SHOWS GREAT INCREASE IN MILK SUPPLY.

In the United States census report on dairy products on farms just issued, the loss of farm made butter in pounds in ten years is remarkable. It shows, says the report, that the making of butter has gone largely from the farm to the factory. It is noted, also, that there is a 32 per cent reduction in the number of pounds of cheese made on farms in the same period.

Milk production in Wisconsin increased in the 10 year period from 1909 to 1919, 69.5 per cent, the figures for 1919 being 858,258,521 gallons. Of this there was sold 473,816,832 gallons. On Wisconsin farms in 1919, 8,666,037 pounds of butter were made, and in 1909 more than 27,000,000 pounds. The farmer ate most of the butter because only 2,933,300 pounds off the farm were sold. But when it comes to butterfat sold, the figures show a large increase, being almost double what it was ten years previously. The dairy farmers sold 82,727,323 pounds and the losses elsewhere in farm-made products of the dairy were made up many fold in this item.

BIGGER GALLONAGE AT ANAMOSA, IOWA.

The Anamosa Farmers' Creamery, Anamosa, Ia., is making great quantities of ice cream this season. Up to this time the output has been 30,000 gallons, which is nearly four times as much as was made during the entire season of 1920. During that season the output was 8,162 gallons. The company makes a fine grade of ice cream, and has no difficulty in placing its output. The figures indicate something of the growth of the ice cream and soda fountain business during the past few years. Ice cream used to be considered a confection. Now it is handled as a food.—Anamosa (Iowa) Eureka.

The man who does not keep appointments will generally keep everything else if he can borrow it.

A GOOD ADVERTISEMENT.

The average man buying space in a newspaper for advertising purposes uses the space to exploit his wares. It is his space, he has or will pay for it and he has a message for the reader about his product, or whatever he is advertising. He is courting favorable attention.

It is not our intention to pose as a judge of advertising. Few people agree on what constitutes effective advertising copy. With this brief introduction, which may serve as an excuse for reproducing the advertisement below, we ask that you read the following which we clipped from the Pittsburg Leader. A quarter page space was used in displaying it in big type. Note how little is said about Rieck's ice cream, yet we submit that it is interesting and effective advertising copy:

THIS IS THE REWARD
THAT LABOR BRINGS.

From the whittling of a stick to the building of an empire, man's labor, intelligently expressed, is the root and base, the body and blood, the bone and tissue of existence.

Without labor, nothing is or nothing could have been. It is the food in our mouths, the clothing on our backs, it is light and heat, shelter and protection. It is part of all we have, or are, or ever hope to be.

So it is that as a man expresses himself in labor for the benefit of fellow men he prospers in material reward and grows contented in the joy of tasks well done.

But, his labor must be constant and progressive, else, like clay which hardens under idle hands, the object of his task will never see the fullest glory of expresion.

He must not only work long hours and many, but he must seek out new methods and better plans, that he may "make two blades of grass grow where only one grew before."

If he is a manufacturer he must improve his plant, his equipment and his facilities. He must often go far afield for materials and ingredients that will be in keeping with the standards he observes. He must plan his production and his distribution so that the finished product of his labor will conform with the ideals of quality and service that brought him his success.

In short, his is the obligation to combine the powers of equipment, materials and systems, and co-ordinate them into a smoothly working whole.

Then, while he labors on, achieving honor that is real and tribute that is lasting he knows that there are always the clever few who believe in a short and pleasant by-way to success.

But, one after one he sees their claims disproved. Quality that is assumed, service that is superficial, value that has no basis in fact all die and pass away while humanity, old as the ages in experience, sits at judgment.

And so the worthy laborer grows strong with the years, gathering his reward about him, and prospering in the kind esteem of fellow men.

This week all of the more than 2,000 Rieck dealers have on sale a few Private Brand Brick—Maple Nut—an Ice Cream of surpassing goodness—just right for warm weather dessert.

Friends are good things to have in reserve, if you can depend on yourself for the present.

Increases Winter Business

Think what it would mean to you to ask thousands of customers their first choice of fruit, and flavors, and then offer those same customers a combination of a dozen or more of those first choice fruits and flavors, made into a **Supremely Delicious Ice Cream.**

Blanke-Baer Honey Fruit Salad

The Marvelous Fruit Combination means much in overcoming Winter Selling difficulties as Honey Fruit Salads adds to your Ice Cream just the Fruit and Flavor your customers want.

Put up in gallons cans, 10 gal. kegs, ½ bbls. and bbls.

Don't lose time or wait for sample. Order TODAY a case (6 gal. cans) of this heavenly mixture. You'll be surprised at wonderful results and low cost.

A Vanilla Products Display at Buffalo

"Yes, indeed," says Mr. Gabe Wegener, President Hudson Mfg. Company, Chicago, "we will be at Buffalo, the Third Annual Eastern Exhibition of the Association of Ice Cream Supply Men. We have just two products to display—Hudson's Ice Cream Flavor No. 52 Special, and Hudson's Ice Cream Flavor Concentrated No. 52 Special. In other words, our exhibit will be a 'Vanilla Products' display, showing the products both in the raw and finished stages. Though we have been furnishing the ice cream industry with Vanilla Products for over thirty years, and enjoy, consequently, a thoroughly established business, we are keen for the Association of Ice Cream Supply Men. We are convinced that the purpose back of this organization, the character of their exhibitions, and the several activities of the organization throughout the year, all materially benefit the ice cream industry as a whole. And we are eager to do our part to further the good already accomplished. Simply stated, we will be at Buffalo because we value and appreciate that the ice cream industry has reached a point of development where such an organization, as above mentioned, is a prime necessity."

Illustration above shows the Hudson Display Booth at the First Eastern Annual Exhibition of the Association, held at Philadelphia.

A NEW BOOKLET ON CAR TANK TRANSPORTATION.

The Pfaudler Co., Rochester, N. Y., has recently issued a booklet describing their car tanks, which will be of special interest to plants where large quantities of materials are transported from one branch to another. A copy of this booklet will be furnished on request by the Pfaudler Company.

"....our continued business"

Excerpt from *the* letter attached to our salesman's order

Confirming a verbal order recently given one of our salesmen, a very complimentary letter accompanied the order, part of which we quote herewith.

"We would like to take this opportunity to express our appreciation to you and your firm for the service we have received on our recent shipments and also on the uniform quality of your product. "We receive compliments daily on the true delicate bean flavor your Vanilla produces and it is our belief now that we have a Vanilla that will earn us a reputation. Convey to your firm our sentiments and you may rest assured of our continued business so long as we receive the same high quality Vanilla we are now getting."

Naturally, we want that "continued business," and of course we know we will be assured it only so long as Hudson's Vanilla runs true to its established standard.

"Distinction does not consist of self-asserted claims." Leadership in any particular line is not a thing to be decided by the "Leader." His supporters attend to that. Our present position in the Vanilla Business comes from others —those whom we have served during these thirty-three years of consistent, earnest, constant effort to deliver a good product, on time, at a fair price.

The expressions of genuine satisfaction we are constantly receiving from users of Hudson's Famous Ice Cream Flavor Vanilla and Tonka Blend No. 52 Special, lead us to believe that there is a pleasant surprise awaiting your first trial of it—which later will become a firm conviction that in Hudson's Vanilla Products you, too, will have found "a Vanilla that will earn us a reputation."

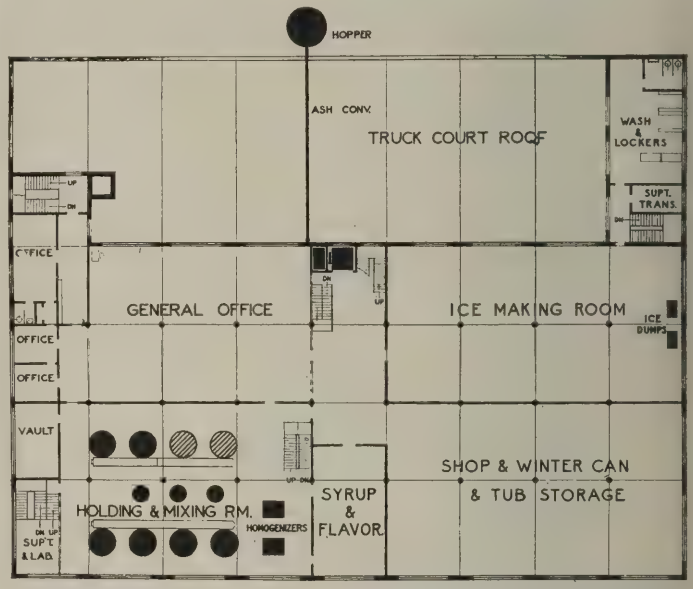
The Layout and Design of a Modern Ice Cream Plant



By FRANK D. CHASE, President, Frank D. Chase, Inc., before the National Association of Ice Cream Manufacturers, Minneapolis, Minn.

SOME day some one will write "The History of an American Industry," and the student thereof will learn some valuable lessons applicable to his own business. The ice cream industry is comparatively a new one, but, through the lessons of other industries many ice cream manufacturers are going to profit, not only by their own mistakes and those of their competitors, but by the history of other lines of manufacture.

The ice cream industry is going to follow other American industries through a period of radical evolution. Nearly every manufacturer, regardless of his product recognizes this, and the more progressive and

FIRST FLOOR PLAN FRANK D. CHASE Inc-ENGINEERS CHICAGO

SECOND FLOOR PLAN FRANK D. CHASE Inc-ENGINEERS CHICAGO

far and clear thinking men not only recognize this fact, but understand just what this is and what it means to them.

To continue in business, to exist as a going concern, one must meet this revolutionary situation and master it. For generations American manufacturers have prospered and expanded, and it has not been extremely difficult to do so. The markets for products have grown faster in scores of instances than the manufacturer could supply. Raw material and labor were abundant and cheap. Competition was usually negligible. Horse sense and hard work counted about 99%.

All this is changed. Raw material prices are usually controlled by interests powerful enough to dictate prices. Labor is paid more; is organized and demands, deserves and is receiving more than in the past. Advertising is a necessity. Competition is keen—new plants, some small, many with large capital, are entering the field. Scientific management, in two words, is the summation of this radical revolution.

While horse sense and hard work still bulk large in the successful business, in fact, no business prospers without them, there is one more factor to be taken into account in modern business. This factor is science. We all know that the ice cream factory would not function long without the laboratory. This is science. The milk engineers have developed equipment which can only be built or operated with a knowledge of chemistry. This is science. Your raw materials and your process and finished product are dependent upon refrigeration. This is science. And I now mention one other branch of science which is to-day recognized in almost every industry in this country. I refer to plant engineering as playing an essential and increasingly necessary part in not only the layout and design of the ice cream plant, which the title of my paper mentions, but in its location, layout, design, finance, operation and management. These factors, properly engineered, make scientific management.

This subect is big enough to fill volumes, so I can only describe briefly and in outline the development of a plant, and while it all seems obvious as we run over it, I can assure you, from the experience of one who has been laying out plants for 20 years, that a scientific analysis of these factors is, at least until very recent years, usually neglected.

Consider then, briefly, the following factors:

Location.

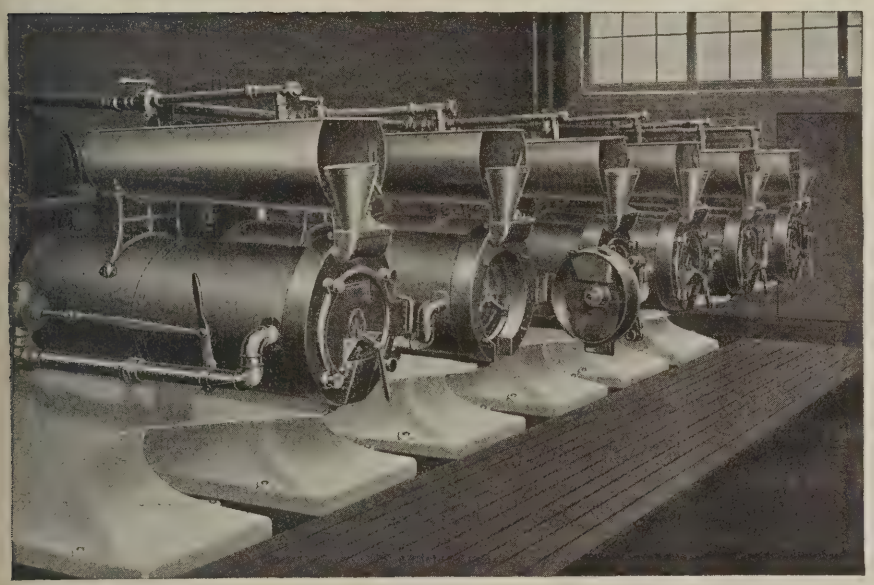
First: The city—its market, supply and cost of raw materials; its climate with consequent annual per capita consumption. The kind of distribution and its cost, availability of capital and of labor; the competition and consequent size of market. These things determine the proper city and the size of the plant which may be operated profitably.

Secondly: The site. Practically the same problems localized, i. e., supply of raw materials at the right cost. Track and truck receipts and deliveries. Labor, proximity to market.

Layout.

We are all familiar with plants which are properly laid out; their operation is joyful and profitable, and alas, we are more familiar in the ice cream business, as in every other business, with plants which are not well laid out, and these pay daily a tax which is worse than a government tax because competitors do not all pay it.

The old adage that "the longest way 'round is the shortest way home", does not apply to the modern factory. It should read: "The shortest straight line



DON'T BUY NOW!

Wait Until You Have Seen the Latest

U. S. Heavy Duty Freezer

at the National Show

New Features to be Shown for the First Time

1. An advanced form of batch control that is based on entirely new principles, and satisfies every requirement of correct modern ice cream manufacturing. (Standard equipment on all of the larger sizes from 100 qts. capacity up; optional on smaller sizes.)

2. The old Fruit Hopper is done away with, and greatly improved facilities to make it easy to fill in the fruits and flavors, and inspect the process of freezing are provided.

3. A new cream control which is a great improvement over the old. The moving parts are few in number. They are easy to disassemble and put together again for cleaning, and their action is precise and reliable.

4. The cream passages have been very much simplified, and the old style cream inlet valve on the cover has been eliminated.

5. A rotary brine control valve having several distinct advantages over all former designs.

Our Exclusive Features and Special Advantages

Adjustable Motor Table.
Guard with Chain Running in Oil.
Easily Converted from Belt to Motor Drive and Vice Versa.
Shafts, Bearings and Gears of Finest Materials and Extra Heavy Construction, machined by the most approved scientifically correct methods.
Brine Jacket and Passages that do Not Clog Up Easily or Leak, Yet are Readily Accessible for Inspection and Cleaning.
No Soldered Joints to Open up and Leak.
Bolted-Together Unit Principle of Assembly, all parts interchangeable.
A Really Heavy-Duty Machine.
Roller Bearings (on all large sizes—optional on smaller sizes.)
Widest and Most Complete Range of Sizes— 40, 50, 60, 100, 120 and 160 quarts.
The Largest Ice Cream Freezer in the World is a U. S. Heavy Duty Freezer.
Rapid Vertical Discharge.
Whipping Device of most approved double dasher type, easily removed, cleaned and replaced and developed to give the finest velvety texture to the finished cream and the desired overrun.
Patented Removable Bearing and Support, independent of cover, for front end of dasher.
Hinged Cylinder Cover on All Sizes.
Quick, Thorough Mixing of Fruits and Flavors insured by Special Arrangements.
No Iron or Other Corrosive Metals to wear or Come in Contact with the Cream Inside the Freezer.

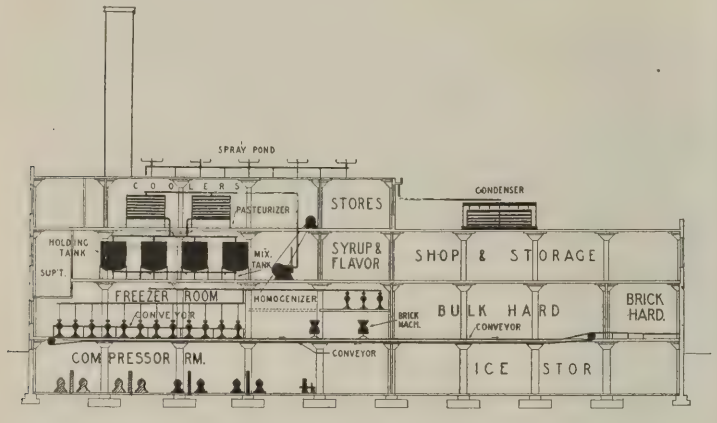
Where 9 160-Qt. U. S. Heavy Duty Giant Freezers Were Ordered in One Season

The Colonial Ice Cream Co., of Philadelphia, have this season ordered altogether **nine** 160-qt. Giant U. S. Heavy Duty Freezers. These machines represent the very latest in ice cream freezer construction, including Hyatt Roller Bearings and the automatic batch control. The Colonial Ice Cream Co. is one of the most progressive in the business, and decided in favor of U. S. Heavy Duty Giant Freezers to replace smaller units only after thorough test in actual service.

U. S. Freezer & Machine Corporation

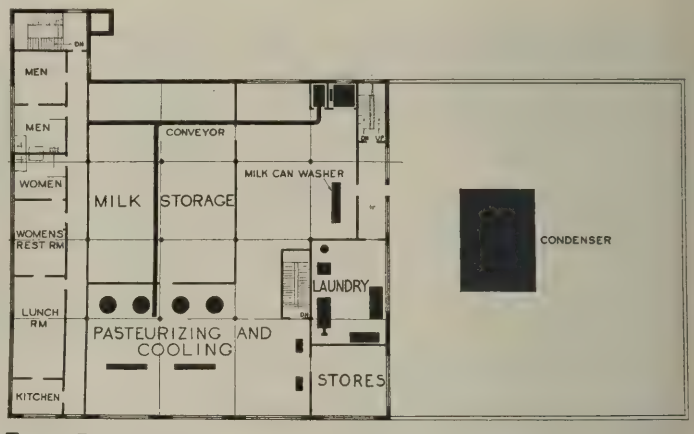
Union Avenue and Frost St., Brooklyn, N. Y.

Representatives and Distributors in all Parts of the United States and Canada



No. 18

between the points of receipt and delivery is the shortest way home to profits", and in the ice cream factory we have a factor to help and one which is often forgotten, i. e., the law of gravitation. Let nature handle your materials. It is cheaper than pumping.



With these simple principles in view, follow the processes through the diabramic plant herewith illustrated.

The capacity of the diagramatic plant illustrated is approximately 20,000 gallons maximum per day. It is, of course, possible to make the problem a specific one by making a large number of assumptions and working out in detail each department. This seemed unnecessary.

The successful plant is the one which is individual in its planning. Within limits standardization is a good thing, but it is frequently carried too far.

LONGITUDINAL SECTION FRANK D CHASE Inc-ENGINEERS CHICAGO

THIRD FLOOR PLAN FRANK D. CHASE Inc-ENGINEERS CHICAGO

These diagrams are primarily to suggest simplicity and co-ordination in layout.

The short straight line of processes may easily be traced through these plans in the following steps:

1. Receiving: Milk and cream delivery by truck or car, in covered court of size to permit of rapid handling of trucks.

2. Continuous milk can elevator carries cans of milk to the top floor of the building, where they will be discharged automatically on to a roller conveyor which acts as a magazine for feeding to can storage or pasteurizer.

3. Sugar and stabilizer are added in the pasteurizer, from store room adjacent. These stores and other supplies being handled by the freight elevator.

4. Homogenizers follow the pasteurizing from which the mix goes to coolers on the top floor and again by gravity to the holding or aging tanks on the second floor.

5. Freezers are fed from the batch mixers on the second floor by gravity, and these in turn are filled by gravity from the holding tanks. Overrun testers, gelatine kettle and other equipment is shown on space provided.

6. Bulk and brick hardening, packing and storage is provided and final delivery made at the platform. Ice is manufactured on the second floor, stored on the first and basement floors, and crushed and conveyed to truck loading spouts.

7. Power plant is located in the high basement, with facilities for coal and ash handling. A score of other essential facilities include a machine shop, can and tub shop and storage, laboratory, laundry, store and stock rooms, salt receipt, storage and delivery. Employees welfare facilities. Compressors are, of course, adjacent to the power plant and condensers are on the roof.

These are the essentials of the manufacturing layout. The cost of the plant and its equipment, as well as its profit, may vary 50 per cent, dependent on the economy and skill displayed by the engineer in coordinating all of these departments.

The utilization of our friend, so often slighted, the law of gravity, induces us to build vertically instead of horizontally—an advantage in decreasing the cost of property, smaller properties, too, being easier to secure.

Another consideration often overlooked is an anticipation or provision for the future. Fifteen years ago the average manufacturer gave little thought to large increases in business.. To-day the plant builder who neglects the consideration of the future is courting failure. We know that we must grow to keep in business, and we must plan accordingly, bearing in mind not only population or market, but its location with attendant delivery costs. Before a plant is designed, a comprehensive plan for 2, 4 or 10-fold growth through central and branch plants should be carefully worked out.

Subsidiary lines of manufacture which balance the daily or seasonal demands on equipment and organization, must be developed in connection with plant design. Ice, milk and beverages are logical lines as we know, and there are others becoming more common.

The structure which houses the machinery of an ice cream plant is, itself, a most important piece of equipment. The process, that is, our shortest straight line to profits, must first be worked out and the building slipped between and around this equipment.

There is no line of demarkation between the frame of the building as equipment and the machines themselves. Let me prove this:

Sanitation.

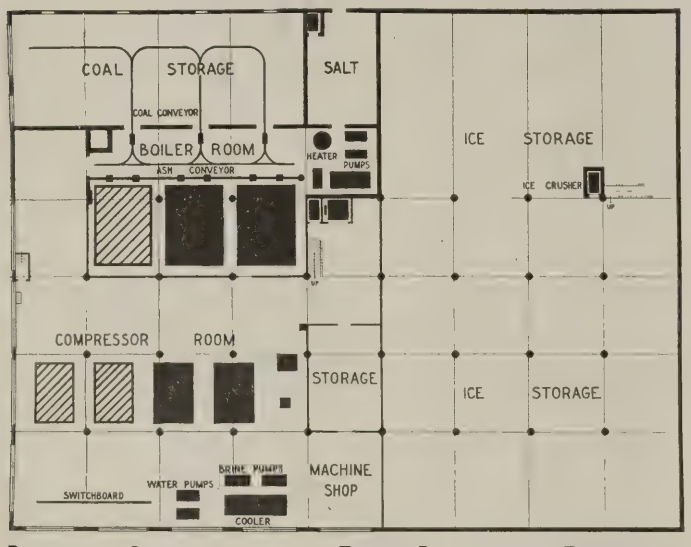
Proper drainage and absolute cleanliness are lrst essentials. Not only must walls and floors be of proper, and incidentally economical materials to permit of thorough and easy cleaning, but every piece of apparatus must clean readily, and preferably by gravity, into or onto the building itself, at a particular place. It is surprising how many floor drains do not drain.

Refrigeration is the big item of expense in the ice cream factory. It's a question of insulation vs. coal, and the engineer can, or should figure, not only the refrigeration required for every operation, but should design every square foot of insulation with specific

of the year and the news you want to hear!

The EASTERN EXHIBITION of the Association of Ice Cream Supply Men is to be held in Buffalo October 31st to November 5th inclusive. Machinery —equipment — services — supplies — the representative supply houses of the nation participating — a Show to serve the ice cream industry exclusively— one thousand persons of the industry attending—150 booths—150 varieties of essential articles and products — promoted, managed and its constructive character assured by the non-profit-taking organization which has given the buying ice cream manufacturer a "Seal of Safety,"

THE SEAL



OF SAFETY

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
1328 BROADWAY NEW YORK CITY

reference to that profit consumer, the boiler. It does not take many tons of coal, or many days' operation to pay for a bit of insulation, which then becomes a dividend payer instead of a tax..

The type of building for a given plant depends on local conditions, location, city ordinances and funds available.

Concrete gives us for the heavy loads carried, the cheapest, most sanitary, water tight and durable construction. It has one feature which emphasizes the unity of building and equipment. It's extremely difficult to cut or change. Pipes in concrete usually stay put, and if incorrectly placed are expensive to move. The location of every pipe and every piece of machinery must

BASEMENT PLAN FRANK D. CHASE Inc-ENGINEERS CHICAGO

be incorporated into the plans of the big piece of equipment, that is, the building.

The large and heavy units must be located to permit of properly and economically designed floor slabs, columns and foundations. Settlement breaks pipe lines.

Labor has been mentioned as a factor in plant operation and therefore in costs. This is especially true of the ice cream plant and I have shown the numerous items of conveying equipment, which the large plant cannot afford to be without. Even small plants can profitably install many inexpensive units of labor-saving conveying equipment. Conveying equipment properly designed is absolutely essential to the profit-making plant. Its first cost and savings in operation over labor can always be pre-determined. Conveying equipment, too, must be designed as an integral part of the building.

In the modern plant, the laborer increases his production by virtue of his operation of proper equipment and earns more for his employer and himself.

Much has been written and said about "productive" and "nonproductive" labor. Non-productive labor, I believe, can be easily classified as labor which can be eliminated through proper equipment. All other labor is productive of some results, regardless of whether or not the work in question results in a change of the character of the material handled.

There is to-day in most ice cream plants the opportunity for the elimination of non-productive labor through the installation of proper conveying and material handling equipment.

The modern ice cream factory, lighting, heating, plumbing, ventilation and welfare requirements are a study in themselves. State and municipal laws are becoming more and more rigid, and the number of men and women employed, their location in the plant and their comfort and well being, must be considered in connection with each department, and in the design of the building.

The equipment of an ice cream plant forms an imposing array. For the sake of bringing a realization of the scope and complexity of this problem, I simply tabulate herewith a list of the more important units. The connections, valves, motors, etc., multiply this list by many fold: Boilers, stokers, ash-handling equipment, breeching, vacuum pumps, process pumps, air compressor, damper regulators, instruments, draft gauges, thermometers, etc., valves, traps, blow-off tanks, heating system, plumbing and sewerage system, fuel, coal handling equipment, stack, feed pumps, water heaters, heater for process work, temperature control, soot blowers, scales, piping layout, fittings, bilge pumps, pipe covering, ventilation.

Type of System — Compression — Absorption.

Compressors: Type—Vertical or horizontal, double acting or single acting. Drive—Motor or steam.

Direct or belted, high or low speed.

Condensers: Atmospheric or double pipe, condensing water, temperature range, spray pond, cooling tower or wells.

Brine Pumps: Centrifugal and reciprocating, steam driven or motor driven.

Condensing Water Pumps: Centrifugal or reciprocating, method of drive.

Ammonia and Brine Piping Layout: Type of valves, type of fittings, type of receivers, type of oil separators, type of scale traps, type of accumulators, type of insulation.

Ice crusher, ice conveyor, elevators, freight and passenger, salt elevator and hopper, can conveyors, ice cream conveyors, can washers (ice cream), ice cream freezers, bricking machines, holding tanks, batch mixers, pasteurizers, mixing kettles, homogenizers, coolers, milk can washers, sanitary piping system.

Capacity and dimensions, system of refrigerating, type of agitators, type of cranes, can dumps, ice chutes or lowering devices, cans, can fillers, system for air agitation.

Source of Supply (if private plant): Character of current A. C. or D. C., distribution voltage, generator equipment, switchboard, power distribution system, number, size and type of motors, motor location, load centers, present and future load requirements, type of lighting system, proper intensities of illumination, lighting layout location of outlet, mounting heights and spacing of lamps, reflector equipment.

If Public Service—Location of lines, class of service available, service requirements, line extensions — cost if any, reliability of service, power company special rules if any, local codes if any, departmental metering, telephone systems, auto-call systems.

Laundry Equipment: Washing machines, ironing machines, extractors, dryers.

The financing of the plant is not entirely outside the scope of this paper and a word may be permitted. For years the investment house and your personal banker have bought and then sold securities and financed industrial loans on the statement of the client that a profitable going business was entitled, for certain purposes of enlargement or new construction, to funds or loans. The auditor and appraiser established the value of the business and its record of profits and the lawyer established the legality of the transaction, and investigation stopped at this point.

Present day conditions require more than this. There is many a plant which has a successful record of

W. B. Wood Mfg. Co.

Correspondence Solicited.
We Furnish The Taste.

earnings covering years, which will never earn another dividend without rehabilitation or remodeling to cut costs—to meet modern competition.

A prominent New York banker recently wrote an article, which has been widely circulated, on "The Engineer and the Banker," explaining the function of the engineer in connection with the issuance of industrial securities. To-day engineers are called upon frequently to pass upon the physical capacity of plants to continue to earn dividends. Had this been the practice generally during the past few years, there would have been fewer instances of passed dividends and decreased earnings. The engineer can help in financing and refinancing through intelligent estimates of plant costs and by honest and competent endorsements.

Plant operation and management can be strengthened and made easier by the engineer. He can introduce into the going plant the economics which can be effected by the improvement, simplification or balancing of equipment, by the introduction of labor-saving equipment and the modernization to meet the new competition.

Layout and design is the one big activity around which center the manifold needful activities of the engineer who hopes to help in the development of a most promising and profitable industry—the manufacture of ice cream.

BIG OPENING OF NEW CREAM AND DAIRY CO.

On the evening of September 1st the modern plant recently completed by the Ironton Ice Cream and Dairy Co., Ironton, Ohio, was thrown open to the inspection of the people of Ironton and vicinity. Splendid music was engaged for the evening.

The new plant is equipped with the most modern machinery available for the manufacture of ice cream. The company is justly proud of their new plant and the public were cordially invited to avail themselves of that opportunity to observe the manufacture of ice cream under the most modern and sanitary conditions.

REVIEW BEST OF ALL.

Mr. F. Fellows Mason, of Dunmore, Scranton, Pa., when remitting for the renewal of The Ice Cream Review for a period of two years, penned the following testimonial on the invoice which he returned to us: "The best paper of ALL I receive." We hope all of our readers are of the same opinion, and we mean to make it our business to endeavor to have you think the same as Mr. Mason.

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION

To All Members.—Since you received the second notice of your own Pacific Convention to be held in Seattle, November 14th, 15th and 16th, your program committee have made progress, and we have been able to secure some real live speakers, both locally and from the East, and we can assure you something very interesting and instructive, put over by men who know how to make their arguments count.

We want you to bring as many of your plant men as possible; they are the ones who are in daily contact with the subjects that will be discussed, and after listening to the papers and the discussions to follow they are going to make more efficient members of your organization.

Try and keep on speaking terms wtih your wife until this big event, as we want the ladies to attend. The Seattle boys are going to see there is nothing lacking for their comfort and entertainment.

Make no other engagements for the dates marked. This is your Convention, and you must do all you can to make it the success it should be.

Yours truly,

PACIFIC ICE CREAM MFR'S ASSOCIATION,
J. E. Dunne, President,

Attest: Bert H. Walker, Secretary,
Jay H. Kugler, Field Secretary.

WHAT IS SALES MANAGEMENT?

That salesmanagement is inclining more and more into a financial phase of business and that the salesmanager instead of being a developer of business must be a producer of business at a profit, was the keynote of an address made to the Baltimore Ad Club by A. H. Deute, General Sales Manager of the Borden Company of New York.

Mr. Deute pointed out that during a period of years the salesmanager has developed from a head salesman who checked over the daily reports of salesmen into an executive whose real work it is to find ways and means for so placing the production of a house that the greatest immediate profit may be realized while at the same time the future good will of the organization is developed. It was further developed that the salesmanager who fails to appreciate his responsibility toward the financial side of the business is falling far short of his opportunities because the problem of business houses to-day is not volume but a stabilization of earnings.

URGES ICE CREAM FOR PUPILS

Yakima, Wash.—Ice cream may take the place of milk in school children's luncheons if the suggestion of Superintendent A. C. Davis, Yakima, Wash., is favorably acted upon. There would be no increase in the cost, dairymen say, and the dish would be more palatable than milk during the warm season. A committee, consisting of Dr. W. L. McClure, Dr. H. H. Smith, Secretary B. F. Kumler of the school board, and Superintendent Davis, was appinted to determine the standard for this year's milk supply.

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want Department.

Filled Milk Legislation

THE following is a report of the House Committee on Agriculture in connection with Representative Voigt's Bill (H. R. 8086) to prohibit the transportation across state lines of bogus milk compounds. This bill is of great importance to dairy interests of the country and the National Milk Producers' Federation will greatly appreciate your endorsement of this legislation.

CHAS. W. HOLMAN,
Acting Secretary National Milk Producers' Federation.

* * *

The committee on agriculture, to whom was referred the bill (H. R. 8086) to prohibit the shipment of filled milk in interstate and foreign commerce, having considered the same, report it back to the House without amendment, with the recommendation that the bill do pass.

Purpose of the Bill.

During the last five or six years the manufacture of so-called filled milk has assumed considerable proportions in this country, and the bill proposes to prohibit the manufacture of this compound in the District of Columbia, the territories, and insular possessions, and to prohibit its shipment in interstate and foreign commerce. Filled milk is defined to mean "any milk, cream, or skimmed milk, whether or not condensed, evaporated, concentrated, powdered, dried, or desiccated, to which has been added, or which has been blended or compounded with any fat or oil other than milk fat, so that the resulting product is in imitation or semblance of milk, cream, or skimmed milk, whether or not condensed, evaporated, concentrated, powdered, dried or desiccated." The bill provides a penalty of a fine not exceeding $1,000, or imprisonment for one year, or both, and has the usual provision that the act, omission, or failure of any person acting for or employed by another, within the scope of his employment or office, shall be the act, etc., of the principal, as well as of the agent or employe.

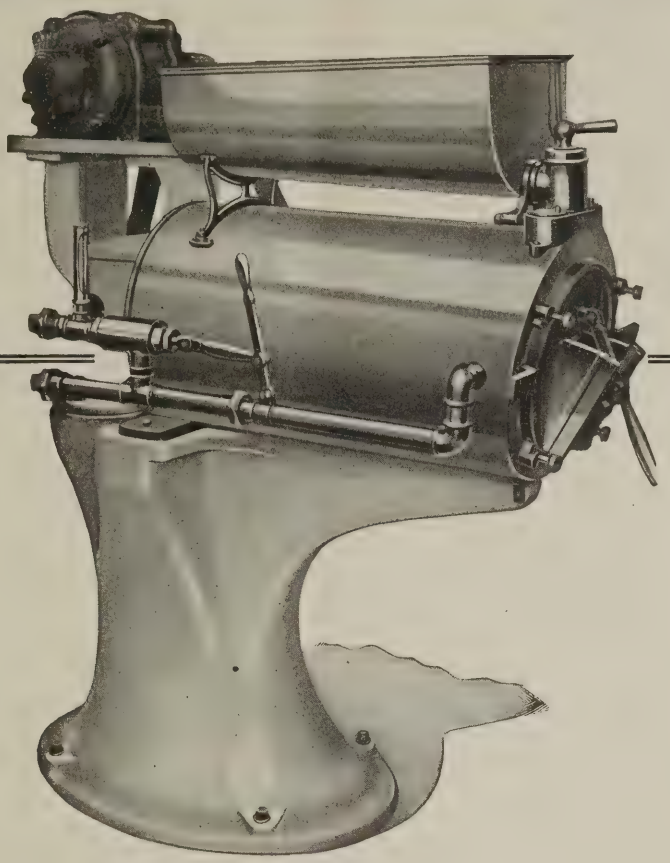
The Compound.

Filled milk is an imitation of condensed or evaporated milk made by mixing condensed skimmed milk and cocoanut oil. The skimmed milk is reduced by evaporation to about half its bulk, and after this operation there is added from 6 to 8 per cent if cocoanut fat. The resulting mixture is an exact imitation of pure evaporated or condensed milk; it has the same consistency, the same color, the same taste, and the difference in the two products can only be detected by an expert or by chemical analysis. The compound can be made more cheaply than the regular article, and, in view of the fact that the imitation is perfect, many people buy it in the belief that they are getting full condensed or evaporated milk. According to the testimony of the leading manufacturer, skimmed milk has recently sold for 35 cents per hundred and refined cocoanut fat at 12 cents per pound. The cost of a quantity of skimmed milk and cocoanut fat sufficient to fill 48 1-pound cans of the compound is a little over 80 cents, or less than 2 cents per 1-pound can. The retail price of the 1-pound can is from 10 cents up. The Bureau of Markets gives the following figures of the production of the compound in recent years:

Evaporated, part or full skimmed, modified with foreign fat (case goods), 1920, 84,044,000 lbs.; 1919, 62,262,225 lbs.; 1918, 50,619,163; 1917, 30,488,262 pounds.

Evaporated, part or full skimmed, modified with foreign fat (bulk goods), 1920, 2,517,000 lbs.; 1919, 2,748,120 lbs.; 1918, 3,861,097 lbs.; 1917, 4,543,640 lbs.

In 1920 nearly 8,000,000 pounds of cocoanut fat were used in the manufacture of filled milk, taking the place of that many pounds of butterfat, injuring the market of the American farmer, and bringing his product in competition with a decidedly inferior product produced by oriental and other cheap labor and handled in many instances under shockingly insanitary conditions.



Fraud on the Public.

Filled milk is sold under various trade names, such as "Hebe," "Carolene," "Enzo," "Silver Key," "Nutro" and "Nyko." The manufacturers can not sell it as milk, but it is put up in the same size cans as regular condensed milk, and the evidence before the committee shows that it is advertised by the retail dealers as milk and evaporated milk. Storekeepers sell it with the statements that "it takes the place of milk," "just as good as condensed and much cheaper," "nothing better on the market," "takes the place of condensed milk." Instances have been found in which the cocoanut fat was mixed with milk and sold for cream; the compound has been used for making ice cream, and recently a company has been formed at Pittsburgh to manufacture an artificial cream from skimmed or fresh milk and cocoanut fat. The company states in its prospectus, "we can wholesale our Kream for 100 per cent less than cow's cream and still make a profit of over 100 per cent." In many cases retailers sell the compound for the same price as the straight evaporated milk, although the price per 1-lb.

JUST MAKING IT CLEAR TO THOSE THAT HAVEN'T HEARD

That the Southern Exhibition of supplies, machinery and equipment in the Auditorium-Armory, Atlanta, Ga., November 28th to December 2nd, inclusive, is in the service of the ice cream industry of the South—the country where the sun itself is ice cream's friend. As great, as important as a National Industrial Fair is to a country—for it will be the heart and the soul for a week of the growing industry of a growing section, where the entire range of methods, materials, ideas and suggestions that an ice cream manufacturer can use will be at hand. One hundred and twenty booths—20,000 square feet of floor space — experts in supplies, machinery, equipment, merchandising and advertising service from the entire country—a serious, dignified and epoch-making Show, made possible through the national co-operative work of

THE ASSOCIATION OF ICE CREAM SUPPLY MEN.

Emery Thompson Brine Freezers

are built stronger than the heavy motors that operate them.

The Emery Thompson is qualified for accuracy and high production.

If you want to get the most out of your sweet cream, you can always rely upon an Emery Thompson for giving the cream smoothness and fullness of body.

"Write for catalog and prompt delivery"

Our machines will be shown at the Minneapolis, Buffalo and Atlanta Fall Conventions, and we cordially invite you to call on us.

can to them is about 3 cents less. A number of surveys in various parts of the country show that the compound is sold largely in sections inhabited by people unable to read English and sections inhabited by people of limited means, and not sold at all in better residential districts. The fact that it is largely sold in the sections mentioned shows that the statements on the label that the article is a compound is not a sufficient protection to the public.

It appears that even the United States government was defrauded into buying this compound. At Camp Willis, Ohio, in 1913, two carloads of it were furnished at this camp for the use of the troops, and the mess sergeant stated that he had been informed that it was better than milk.

There is ample evidence that the compound is sold at retail as milk, but the interstate shipment can not be prohibited under existing law because the manufacturers label it under a trade name, and not as milk. There is no doubt that the sale of the compound violates the spirit, if not the letter, of the pure food and drugs act. The act provides (sec. 7) that an article of food shall be considered adulterated "if any substance has been mixed and packed with it so as to reduce or lower or injuriously affect its quality or strength," or, "if any substance has been substituted wholly or in part for the article," or "if any valuable constituent of the article has been wholly or in part abstracted," and shall be considered misbranded (sec. 8) "if it be an imitation of or offered for sale under the distinctive name of another article," but the manufacturers escape under a proviso to section 8 that an article shall not be considered adulterated or misbranded, "in the case of * * compounds * * under their own distinctive names, and not an imitation of or offered for sale under the distinctive name of another article." * * *

The regulations prescribed by the Department of Agriculture in pursuance to the pure food and drugs act contain the following:

"Condensed milk, evaporated milk, concentrated milk, is the product resulting from the evaporation of a considerable portion of the water from the whole, fresh, clean, lacteal secretion obtained by the complete milking of one or more healthy cows * * and contains, all tolerances being allowed for, not less than 25.5 per cent of total solids, and not less than 7.8 per cent of milk fat."

No reason is perceived by the committee why an exact imitation of or substitute for this article should be permitted to be sold to the public which does not meet these requirements.

Inferiority.

Dr. McCollum, of Johns Hopkins University, a high authority on the subject of nutrition, testified before the commitee that the vitamines, which are absolutely necessary to promote growth in the human body, are found most abundantly in butterfat, and that milk is the chief article of food relied upon for the vitamines. Dr. McCollum demonstrated his contentions before the committee by showing photographs of rats which had been fed experimentally on diets with and without butterfat, and the results obtained were astounding. He said:

"There is no question but what milk is the only food for which there is no effective substitute. It is not a question of whether there is some food value in skimmed milk, as to whether we can get along in some peculiar situation, that one might not get along if a suitable amount of eggs were included in the diet every day. It is not a question whether technically you can bring before a legislative committee if this sort a situation which might work in a satisfactory manner without this food. But this is the point, that we are educated to use milk. We are a people who for hundreds of generations have depended upon dairy products as a prominent article of our diet. We know how to use it, and we like it. We have an agricultural industry which can not remain a permanent one—there can be no permanent system of agriculture without an animal industry to go with it. * * We have no deposits of phosphorus and no adequate deposits of calcium that will meet the agricultural needs of this country for fertilizer. * * There is no similar property (vitamines) in any vegetable oil, including cocoanut oil and cottonseed oil, comparable with what you find in butter fat. * * I guarantee that any infant that is fed for a few weeks on one of these milk substitutes will develop rickets. * * My suggestion is that we do everything that is in our power to maintain at its full tide an industry so important as the dairy industry, and to bring the American cow into competition with a cocoanut grove is an injustice."

Dr. E. B. Hart, of the University of Wisconsin, says:

"I have already stated in hearings before legislative committees in our own state that at least 90 per cent of the fat soluble vitamine of whole milk is removed in the modern commercial skimming process. This statement is based upon recent experiments in our laboratory, where refinement of control has been perfected, as contrasted with the older experiments made by Dr. McCollum, which led him to state that there was still about 50 per cent of he fat soluble vitamine in skim milk, but it does not begin to compare with whole milk in respect to its content of this nutritional factor."

In a few years the output of filled milk has grown 5,000 per cent, and the manufacturers frankly stated before the committee that the business is in its infancy. The committee is of the opinion that the traffic in the article should be stopped now, before irreparable injury is done the health of the Nation, and before serious damage is done to the dairying industry. The vast dairying industry of this country is absolutely vital to a proper system of agriculture and to maintaining the fertility of the soil.

The farm and dairying organizations are a unit in opposing the manufacture of this compound. If the business grows, as it will without legislative interference, it will mean a decided decrease in the dairy herds of the country. Instead of vast quantities of whole milk being condensed, the butterfat will be extracted and turned into a comparative oversupply of butter.

USEFUL INFORMATION

for manufacturers of
ice cream and water ices
who want to make their products BETTER

GUMPERT'S ICE CREAM IMPROVER

Ice Cream ripened by the usual methods alone cannot reach the same degree of excellence as ice cream in which Gumpert's Improver has been used. This product is as beneficial in aged mixes as in fresh mixes.

Gumpert's Improver is not a *substitute* for natural ripening but a *supplement* to it.

Like Nature, Gumpert's Improver softens and breaks down the coating of albumen, casein, ash and other milk solids that surround the globules of butter fat in cream; but does it far more quickly and more thoroughly than natural aging alone.

The higher proportion of butter fat thus released gives the ice cream a richer, finer taste.

The complete softening of the milk solids by Gumpert's Improver permits the air, when whipped in, to form small, numerous and regular shaped cells. An even, soft, velvety texture is produced in the ice cream.

TEXTOR

A STABILIZER FOR WATER ICES AND SHERBETS

Textor eliminates the roughness and the uneven grain found in ordinary water ices and sherbets.

It produces a wonderfully smooth, even, luscious texture, delightfully free from lumpiness and crystalization.

Textor-stabilized ices and sherbets, no matter how often repacked, harden smoothly and uniformly. The sugar, water, fruit and flavor are held in proper suspension from the first dipperful till the last scraping at the bottom of the can.

Textor, when dissolved, is colorless, odorless, tasteless. Simply mix it with the sugar dry, add the water, then the fruit, and freeze.

The consumption of water ices and sherbets is far smaller than it would be if the ices were better made. Textor brings about much of the improvement which is so essential to the development of this profitable business.

S. GUMPERT & CO., *Bush Terminal*, BROOKLYN, N. Y.

The oversupply will depress the price, and as the price of milk is regulated by the price of butterfat, the keeping of dairy herds will become less profitable. It is possible that in isolated instances farmers receive more money for their milk where the skimmed milk is manufactured into the substitute, but there can be no question that the introduction of the cheap cocoanut oil in competition with butterfat is an economic injury to the dairying industry as a whole.

Views of Agricultural Department.

Dr. C. W. Larson, chief of the dairy division of the department, appeared before the committee and stated that he considered the manufacture of filled milk to be a slight injury to the dairying industry now, but that it would be a decided injury if the manufacture were to increase; that the use of the compound decreases the use of the product of the cow; that by the manufacture of the compound an additional market is not found for the farmers' product; that he was informed by a manager of a company having 156 stores in Washington that the compound is sold at the same price and for the same purpose as was regular evaporated milk:

"I believe that in a nation that has one outstanding industry like agriculture in this country it is to the interest of all the people of the Nation to develop and further that industry. I further believe that the dairy industry is vitally connected with our whole agriculture. What I mean by that is that dairying is important from the standpoint of the production of wheat and corn and all our other crops. * * I think it is desirable and important that that industry be maintained and not injured by some imitation."

Dr. O. F. Langworthy, chief of the office of home economic of the department, stated that he would not object to the compound if its use could be limited to the same use that skimmed milk is put, but that he would not approve of it as a substitute for regular milk, either for infants or adults.

Other Manufacturers.

It is probable that some of the manufacturers of the compound were driven into the business in order to meet competition. Mr. Walter Engels, representing the Borden Co., the largest manufacturer of evaporated milk in the country, stated that—

"His company has always stood for the highest ideals in the production and manufacture and care of milk; and among those ideals is the thought that the public should receive the butterfat in all milk products as the milk comes from the cow. * * If Congress or the several states do not do something to stop this competition, our company may be compelled as a matter of necessity to meet this competition to go into the manufacture of it, much as they dislike to do so. * * Some critics have thoughtlessly argued that the manufacture of the legitimate article should meet this competition by reducing the price to meet it. * * There is only one way you can meet it, and that is to go in and make it yourself, and I know that some of these other companies do not want to make this stuff. They were dragged into it to meet competition with their legitimate articles. If Congress would stop the sale of it, I think they would be glad to stop the manufacture of it. * * The Hebe Co. has applied for registration of its trade-marks in * * many other countries. * * That means that they intend to extend this compound business to foreign markets, and when they find out what this stuff is the whole condensed milk industry is going to get the black eye that the filled-cheese industry got.

For the calendar year 1919 we exported 850,865,414 pounds of condensed milk, and for 1920, 414,250,021 pounds.

Constitutionality.

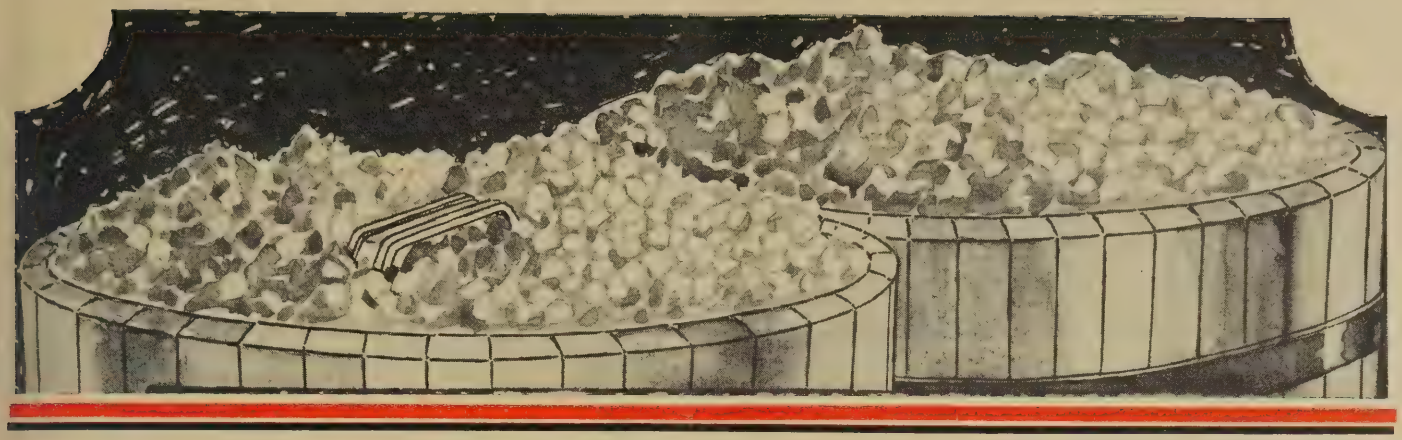
There is nothing new in the proposal that milk products not containing a certain amount of butterfat shall not be transported or sold in interstate or intrastate commerce. Under the pure food and drugs act as it now stands, milk and condensed milk can not be shipped in interstate commerce unless they contain a given percentage of butterfat, and certainly it is proper to insist upon the same standard in an imitation or substitute article. Congress, by virtue of the pure food and drugs act, has barred from interstate commerce many drugs and articles of food which do not comply with certain standards. It has barred therefrom obscene literature and lottery tickets.

The power given to Congress by the Constitution over interstate commerce is direct, without limitation, and far-reaching. Congress may adopt not only the necessary but the convenient means necessary to exercise its power over a subject completely within its power, and such means may have the quality of police regulations.

In the lottery cases (188 U. S., 321) the principle was established—

That it is equally within the power of Congress in regulaing interstate commerce to protect the public morals as it is to protect the public health or the economic welfare of the people. (Hoke v. U. S., 227 U. S., 308).

Congress not only has the right to pass laws regulating legitimate commence among the states and with foreign nations, but also has full power to bar from the channels of such commerce illicit and harmful articles. Congress may itself determine means appropriate to this purpose; and, so long as they do no violence to the other provisions of the Constitution, Congress is itself the judge of the means to be employed in exercising the powers conferred on it in this respect. (McDermott v. Wis., 228 U. S., 115).



Congress is not to be denied the exercise of its constitutional authority over interstate commerce and of its power to adopt means necessary and convenient to such exercise merely because those means have the quality of police regulations. Eckman Alterative Case, 239 U. S., 510).

An Ohio statute forbids the manufacture and sale of condensed milk unless made from unadulterated milk from which the cream has not been removed and in which the milk solids are equivalent to 12 per cent of those in crude milk and 25 per cent of them fat, and skimmed milk is permitted to be sold only under

NO higher standard nor better quality in cream test bottles and glassware can be found than the well known Kimble Brand.

Exclusive rights on the "Crushes" mean greater gallonage per year

THE 1921 season has proved that Ward's Orange-Crush, Lemon-Crush and Lime-Crush Ice Cream Compounds are producers of new business for ice cream manufacturers.

The well-known "Crush" drinks are the most demanded of all fruit-flavored beverages. The ice cream compounds, with the same quality and deliciousness, are proving equally popular in bulk and brick ice cream and sherbets.

Already, many of America's leading ice cream manufacturers have adopted the "Crushes" as standard flavors. This is what they have found: That these flavors are good sellers and fast repeaters, and make a strong appeal when featured as "specials," either in bricks or bulk.

Thus, the Crushes have been the means of increasing their total gallonage this year.

These Compounds import to ice creams and sherbets the rich color, fine fragrance and flavor of luscious oranges, lemons and limes. They are fruit flavors of first quality. They give you full control of flavor and color. With the "Crushes" no additional color is needed.

"We have had excellent results with the "Crushes" as you can know by the good orders given you. We can truthfully state that the "Crushes" are the best we have ever handled."

Brown's Ice Cream Co.,
J. E. Brown, Manager

Ogden, Utah
May 16, 1921

The public **wants** the "Crushes" in ice cream and sherbets. This is proved wherever the products are offered. Think of the selling possibilities of a brand so closely allied with the best advertised and fastest-selling fruit flavors in the world. Think of the prestige—the advantage over competition.

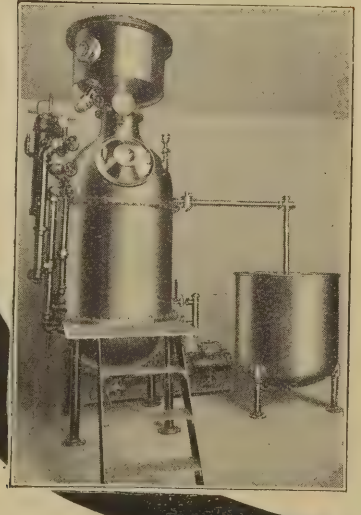
4 True Servants

There is probably no apparatus that has done more to establish operating efficiency and economy in the ice cream industry than the Mojonnier equipment which is briefly described herewith.



Patented.

Mojonnier Milk Tester in the Laboratory

This apparatus determines accurately the butter fat and total solids in all classes of dairy products. It enables the ice cream manufacturer to purchase his raw materials intelligently, paying only for actual amount of butter fat received; also to standardize his mix to within .05%, insuring absolute uniformity and eliminating all guess work. One percent excess butter fat means a loss of 5.4c per gallon of mix, while 1% excess total solids means a loss of 2.5c per gallon. Figure it out for yourself and see how many times this device will pay for itself in your plant, then let us send you our bulletin giving full particulars.

App. & Process
Pat. Pend.

Mojonnier Vacuum Condensing Unit in the Mixing Room

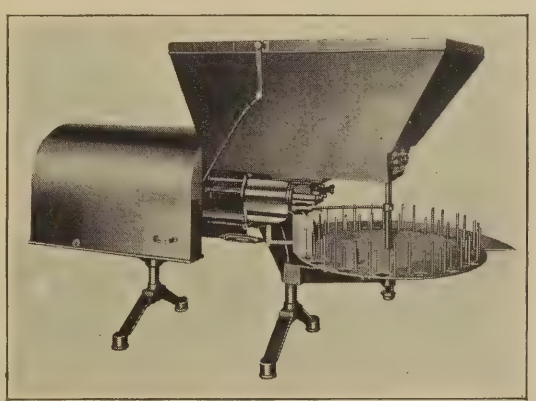
The Mojonnier Vacuum Condensing Unit represents another efficient achievement that is fast being adopted by enterprising ice cream manufacturers. By displacing his pasteurizer and mixing tank with a Mojonnier Vacuum Condensing Unit, the manufacturer is enabled to not only make his mix from fresh milk direct from producer, but also take care of his surplus. Several manufacturers have in this way decreased the cost of their mix 15c per gallon. When there is a surplus of fresh milk above that required for making the regular run of ice cream mix, it can be converted into sweetened condensed milk or some other condensed milk product for which there is always a ready sale, eliminating all losses thru waste and converting them into actual profits. Investigate the possibilities of the Vacuum Condensing Unit in your plant.

Ever Faithful and

to the Ice Cream Industry

Mojonnier Over-Run Tester in the Freezer Room

Pat. Pend.



Every ice cream manufacturer knows what the over-run, or swell, means to him. Good over-run means a nice profit at the end of the year. Insufficient over-run means an actual loss.

By the aid of the Mojonnier Over-run Tester, you can control your over-run absolutely. Each percent of over-run is worth .4c per gallon of ice cream. Frequently the flavor and texture is improved by changing your radio of fat and solids not fat, and increasing the over-run. If you can increase your average over-run only 10%, it means a saving of 4c a gallon, or $4,000 a year on 100,000 gallons.

If you are interested in saving these extra profits, write for more complete details of the Mojonnier Over-run Tester and proof of what it is doing for others every day in the year.

Mojonnier Ice Cream Packing Machine in the Packing Room

Here is a packing machine that is an indispensable acquisition to the ice cream industry. All but human, it automatically packages ice cream just as it comes from the freezer, one, two or three layers at the same time. Fills either quarts or pints, in either one, two or three flavors. Eliminates pouring into molds, dipping, cutting and wrapping. Delivers cream from freezer to package without being touched by human hands and insures absolute uniformity of measure. Capacity twenty quarts per minute or 1200 bricks per hour. Whether your plant is small or large, you cannot afford to neglect the great opportunity for cost-saving which the Mojonnier Brick Machine offers. Investigate our easy purchase plan.

Patented Dec. 17, 1918.
(Process and Other Patents Pending)

certain restrictions. The secretary of agriculture of Ohio in 1918 threatened prosecutions for the sale of Hebe filled milk, and the Hebe Co. brought a suit in equity in the United States District Court in Ohio to restrain the prosecutions. The case went to the United States Supreme Court. (248 U. S., 297). The court held that the Hebe product fell within the condemnation of the statute: that the statute was a valid exercise of the police power of the state, and that no constitutional right of the Hebe Co. was infringed. The court says:

"But the statute could not direct itself to the product as distinguished from the name more clearly than it does. You are not to make a certain article, whatever you call it, except from certain materials, the object plainly being to secure the presence of the nutritious elements mentioned in the act and to save the public from the fraudulent substitution of an inferior product that would be hard to detect. * * It seems entirely clear that condensed skimmed milk is forbidden out and out. But if so, the statute can not be avoided by adding a small amount of cocoanut oil. We may assume that the product is improved by the addition, but the body of it is still condensed skimmed milk, and this improvement consists merely in making the cheaper and forbidden substance more like the dearer and better one and thus at the same time more available for a fraudulent substitute. It is true that so far as the question of fraud is concerned the label on the plaintiff's cans tells the truth — but the consumer in many cases never sees it."

Legislation in Various States.

While the proposed bill will not prohibit the manufacture and sale of the compound within the limits of a state, the committee is of opinion that a law prohibiting interstate shipment will suppress it, because a sufficient market can not be found without such shipment, and also because a sufficient milk supply can not be found in many states which would warrant engaging in the enterprise.

Furthermore, quite a number of states have already passed a law outlawing the compound. Wisconsin recently passed a law making it unlawful to manufacture it. Utah, Maryland, Florida, California, Colorado, Connecticut and Oregon have laws either suppressing the compound or providing such stringent regulations as to make its sale impossible. In New York both houses of the legislature passed similar bills, but it failed to go to the governor. In New Jersey a similar bill was vetoed by the governor. In Pennsylvania a bill was passed by the house but died in the senate committee. Ohio has had a law for many years under which the compound was suppressed, and this year a resolution was adopted by the board of health of the City of New York to the same effect. The department of health—

Takes this position for the reason that cocoanut oil does not possess the food value that butterfat possesses and the substitution of same for any milk product would undoubtedly be reflected in the health of the children of this city. Cocoanut oil is no substitute for milk. Cocoanut oil does not possess the same growing qualities found in the butterfat of milk, and any legislation which would permit the addition of cocoanut oil to any milk product would be opposed to the best interests of the people of the city. * * The board of health of this city has adopted a standard for ice cream in which the use of cocoanut oil or vegetable fats is prohibited.

FROM COAST TO COAST ICE CREAM MANUFACTURERS ATTEST IMPORTANCE OF SUPPLY MEN'S EXHIBITIONS.

The Ice Cream Review last month in an article on the King of Ice Cream Eaters, Roy Tillinghast, of Providence, R. I., quoted J. E. Dunne, president of the Hazelwood Ice Cream Co., Portland, Ore., and also President of the Pacific Ice Cream Manufacturers' Association, and known to ice cream manufacturers of a number of states as "Joe," as saying of the All-Pacific Exhibition of the Association of Ice Cream Supply Men held last year in Portland, that it had done "more for the uplifting of the ice cream business than any other one factor that has occurred in many years."

An ice cream manufacturer from the Atlantic coast has just asserted in a different fashion the value of the exhibitions managed by The Association of Ice Cream Supply Men in a statement concerning the big Eastern Exhibition to be held in Buffalo, October 31st to November 5th inclusive. This manufacturer is L. J. Schumaker, Vice-President of the Crane Ice Cream Co. of Philadelphia.

"The growth and development of any industry, as such, is generally measured by the strength and size of its conventions and its exhibitions," Mr. Schumaker's statement says. "Very few manufacturers can afford to take time away from their business to travel around the country from place to place and see everything new that is developed or brought out; on the other hand, no manufacturer can afford not to take the few days time necessary to attend an exhibit which will group together the newest improvements and the best developments in his particular line.

"Every year we spend considerable sums of money in improvements and additions to our plant, but whatever may be brought to our attention or whatever we consider during the spring and summer months we always say 'Well, we will not buy anything until we have attended the exhibition in October'; and it is only after we have seen the 'big show' that we decide just how our money will be spent. We feel after having seen the exhibits and talked with the other manufacturers who attend that we can feel confident that we have seen the latest and the best, and if we do not then choose wisely it is due to our own lack of judgment.

"I doubt if the average manufacturer attends these exhibitions for the purpose of actually buying at them; he attends that he may determine just what he wants to buy.

"Prices everywhere are gradually settling down and we are approaching an era in which return to price competition is inevitable. Then it is that the manufacturer who can manufacture most economically will continue to forge ahead, while the manufacturer whose methods are wasteful will fall by the wayside.

"There never was a time when it was as important as it is right now for the manufacturer to inquire most carefully into every operation in his plant and ascertain where he can save labor or space, or where he can make one machine do the work of two, or where he can find equipment that will improve his quality—and nowhere can a manufacturer get so much information at so small an expenditure of time and money as he can at one of the exhibitions of the Ice Cream Supply Men."

Works Quick

He (in motor car): "The lever here controls the brake. It is put on very quickly in case of an emergency."

She: "I see, something like a kimono."—Exchange.

John Wood Outing on the Delaware

Bunn Eating Contest. On the left of the star in bathing "costume" is Frank Sutcliffe, President.

The Potato Race.

MORE than 500 employees and their friends of the John Wood Manufacturing Company, Conshohocken, Pa., participated in the third annual outing and picnic to Augustine Beach, on the Delaware Bay, and indulged in various forms of amusements and sports, the plant being closed down for the day. The steamer Thomas Clyde was chartered for the eight-hour trip on the water. The start was made from Philadelphia, and for the first four hours on the trip down the river and bay there was dancing, singing and card playing, while others interested themselves viewing the large plants which border the river, including the New York Shipbuilding Corporation, Sun Oil Co., Worth Brothers big steel mills, Pusey and Jones, DuPonts, the world-famous Hog Island with its deserted ships, and League Island, with its array of battleship grey craft, squares of buildings and docks presented an interesting after-the-war scene.

He Hit 2100 at That! Victor Mauck, chairman of the Board of Directors, who proved to his men he could swing a hammer to the tune of 2100 as well as wield a pen.

At Augustine Beach there was plenty to keep the Jack Woods hustling. Victor Mauck, chairman of the board of directors, had motored down and greeted the party on its arrival. After luncheon the sport events started. A bun eating contest attracted the crowd, where Jack Welsh, the hustling business agent of the Boilermakers' Union, prepared the buns by covering them with a liberal amount of molasses.

Frank Sutcliffe, president of the company, had entered the event. He did not withdraw when he saw those buns, tied to strings, bathed in molasses and was a contestant until the finish, withdrawing in favor of Albert Tanara when his bun dropped to the ground and collected a liberal portion of sand and dirt. Collins was a persistent contestant, continuing for awhile, even after his molasses-covered bun had annexed earth, sand and pebbles.

A bowling competition in which Joseph Winter, Works Manager, J. Daugherty, Engineering Dept., and George Hofstetter, Jr., Sales Department, opposed Joseph Henderson, Purchasing Dept., H. Lee Koenig, Inspection Dept., and Alfred Snow, Engineering Dept., resulted in favor of the last named team after a close finish, 324 to 317, in which Snow came through with a few strikes and spares and won the match for his team.

The Executives' race was a merry little fight between Frank Sutcliffe, Victor Mauck, Joseph Winter, H. Lee Koenig and Arthur Marland. Sutcliffe was the winner. Leslie Heatherton, of New York City, was starter in

Three-Legged Race.

The Executive Staff. Left to Right—Morris H. Feldman, General Sales Manager; Frank Sutcliffe, President; Joseph Winter, Works Manager; Victor Mauck, Chairman Board of Directors, and H. L. Koenig, Chief of Inspection.

all the events. In this event it was claimed that some had "beaten the pistol" and the race was run over with Sutcliffe again a winner in spite of his handicap. Next year he will be placed ten yards behind scratch.

The potato race proved exciting, Francis Lafferty winning from a field of six contestants. In the boys' race, John Mellon, Jr., was the winner. Charlie Slavin carried off top honors in the hammer test, ringing the bell at 3000, while Tom Jenkins was a close second. Morris H. Feldman, General Manager of Sales, W. H. Richman, Sales Manager of the Ice Cream Can Department, Earl Freas, Branch Manager of the Philadelphia office and Joseph Montague, Sales Manager Range Boiler and Tank Dept., took turns with the hammer. Everyone participated in one or more events, and with perfect weather and nothing to mar the days' events it was one of the most successful outings ever held.. On the return home Madeleine Pagnacco won the lucky number dance. Cups were awarded to the winners of all events.

MESSAGE FROM A. E. DIXON

The following is a message from A. E. Dixon, Secretary of the North Carolina Ice Cream Manufacturers' Association, in which he urges 100% attendance at the Southern Convention of supplies, machinery and equipment in the service of ice cream, to be held in Atlanta, Ga. November 28th to December 1st. A copy of the "Act to Require Sanitary Conditions in Ice Cream Plants, Creameries, and Cheese Factories" will be found on another page of this issue. This act is mentioned in the letter given below:

"Final arrangements have been made with the Ansley Hotel by which your President, Mr. White, and myself have secured a reception room for the North Carolina delegation, and everything will be done to make everyone comfortable and feel at home.

"It is feared by some that in meeting with the Southern Convention we may lose our identity, but I wish to impress upon you that this will not be the case, provided the efforts of your officers prevail. Undoubtedly all the Supply Men belonging to our Association will attend, and I sincerely hope we will have a 100% attendance of the Active Members. Saw Mr. White in Raleigh and he assures me he will be on hand, as will the writer. The Secretary is going to bombard you from now until the time of departure with letters, bulletins, etc. urging your attendance. Won't you write me at once, stating you will attend the Convention in Atlanta, Ga?

"No doubt you have received a copy of the Act regarding the sanitary condition of Ice Cream Plants. The Act is the result, as you know, of an interview your Directors had with Mr. Allen at our last Meeting, and I feel the Association should be congratulated on this. It only goes to show what co-operative action will do.

"Let's try some more Co-operation in Atlanta, Nov. 28th to Dec. 1st.

A. E. DIXON
Secretary.

HYDRO CAPITALIZES ON NEW PACKAGING METHOD.

How the progressive Hydrox Company, ice cream manufacturers of Chicago, used their new Mojonnier packaging machine as a selling point in their advertising is shown by the following, taken from one of their advertisements in the Chicago Tribune of Sept. 18th:

"Goodbye to Human Hands

"The Hydrox Company announces another remarkable development in placing an absolutely pure ice cream on your plate. Human hands are now done away with; a wonderful machine has taken their place.

"The Mojonnier Brothers Ice Cream Brick Making Machine

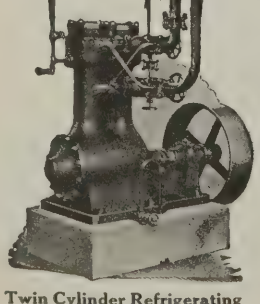
"Is a machine we have been looking for for several years, and which these remarkable men have now perfected. It is a machine that receives the ice cream right from the freezer, pours it into airtight cartons and molds it into perfect bricks, which are immediately sealed. And it is an intelligent machine. It will make you a three-layer brick of orange and pineapple and vanilla or anything you like without ever the touch of the human hands upon it.

"This is the last step. A year ago we gave you the carbonating process. This carbonating process removed all the air from the freezers and replaced it with an atmosphere a hundred times times purer than air, thereby absolutely preventing the dangerous multiplication of bacteria. Now this filling machine takes this purified ice cream right from the freezers, and the cartons are sealed immediately to **KEEP** the air out.

"For today we should like you to try our especially delightful."

⚜

A bulletin issued by the Association of Ice Cream Supply Men contains a little paragraph which shows that, even though business conditions have been far from top-notch, the ice cream business seems to hold fort and come out on top in the quantity produced:



"A Connecticut cross-roads country store keeper, six miles from a manufacturing city that had experienced for months, plant shut-downs and financial difficulties reacting in the surrounding sections, has sold five gallons of ice cream, almost all in cones, every day. There is no reason for believing that either the latent demand for ice cream or its distribution methods have been exploited to anywhere near the maximum."

VISCOLIZERS TOO!

THIS BUFFALO EXHIBITION AND THE ASSOCIATION OF ICE CREAM SUPPLY MEN IS A BIG THING FOR ALL OF US.

By Sealright Co., Inc., Fulton, N. Y.

Mfrs. of Sealright Liquid Tight Paper Containers.

As stated in our advertisement in this issue of The Ice Cream Review, we believe it will pay ice cream manufacturers well to attend the Third Annual Eastern Exhibition of the Association of Ice Cream Supply Men at Buffalo, October 31st to November 5th, inclusive. We base this statement on the knowledge of what the previous exhibitions have accomplished. Representative ice cream manufacturers who have attended, all report that it is at these exhibitions they receive that "something" which sends them back home alert to the significance of their business and the possibilities of progressive growth.

See the Sealright Container on Exhibit at Buffalo

Let us repeat again, these exhibitions are "not merely selling shows." They are not so regarded by ice cream men attending, or the exhibitors. They are educational, inspirational and broadening. Gathered under one roof are displays covering every phase of the ice cream industry. There is the opportunity for the ice cream manufacturer to visualize equipment, methods, and plans, etc., pertaining both to the manufacture and selling of ice cream; further, representatives of the several exhibitors are present, men who must of necessity understand the ice cream industry and who, through their work and travels, come constantly in close contact with problems facing the industry. These men, naturally, are in a position to convey information which means so much to the ice cream manufacturer. Then, also, and of great importance, is the presence of so many ice cream manufacturers themselves. The interchange of ideas and the "relating of 'how we do it down our way'," heart to heart conversations of ice cream fellows, in groups (you will find them all over the place) are so obviously of value that we don't have to explain anything further about it.

The big thing, however, that impresses us, and which, naturally, makes us eager to stand back of the Association of Ice Cream Supply Men, is its established policy to plan and work and direct its activities in absolute harmony with the progressive development of the ice cream industry. There is a spirit of co-operation, a desire to be of genuine value to ice cream manufacturers, a definite purpose to elevate the business standards of those concerns selling to the ice cream manufacturers, and a sincere plan of operation that will assure the accomplishment of these ideals. And we have discovered that the Association of Ice Cream Supply Men has already made itself felt in a way that augers well for the industry as a whole. We are for it.

We will be at Buffalo and at Atlanta, also. We go to these exhibitions and buy space and retain our membership in the Association, not because of the "immediate returns" we might expect, but chiefly because, by so doing, we are openly manifesting our faith in the association and its activities. It must, indeed, be gratifying to the executives of the association to note how prominently ice cream manufacturers have recognized the purpose of the association and have come to regard themselves as co-partners in this big work before us. And, surely, that is as it should be. The most good for all concerned comes only through a mutual understanding of an industry's problems—and it is very evident that such an understanding can most equitably be reached through an association of this character.

Sealright Company, Inc., will exhibit their Sealright Liquid-Tight Paper Containers. Our representatives will be present to explain not so much the container itself, but to discuss and point out how this container bears a distinct relation to the future increased sales possibilities of any ice cream manufacturer. And, naturally, such being the case, our display will contribute its part of the value you will obtain by coming to Buffalo. We shall look for you.

PACIFIC COAST MEN VITALLY INTERESTED IN LABOR MEASURE IN HAWAII.

San Francisco, Cal.—Because of their close relations with Hawaii, California business interests are closely following the threatening labor situation in the Islands, and the progress in Congress of the measure to relieve the shortage in the agricultural industries by authorizing the importation of alien labor in the emergency under regulations to be imposed by the government.

Congress Asked to Pass Measure.

Members of Congress from California are being urged by banking, insurance and steamship interests and other business organizations to support the bill, and leading members of the San Francisco Chamber of Commerce are advocating its passage.

In a statement recently, W. P. Roth, vice-president and general manager of the Matson Navigation Company, quoted letters which he had received from Hawaii to show conditions obtaining in the sugar and other industries.

"Illustrating the conditions which are arising from the curtailment of labor, I have just received a letter from E. D. Tenney, president of Castle & Cooke, Ltd., sugar factors in Honolulu, in which he cites the case of one of the largest sugar plantations in the islands," said Mr. Roth. "As compared with 1919, when this plantation manufactured 31,654 tons of sugar, only 15,338 tons have been manufactured this year out of a total crop estimated at more than 35,000 tons. This condition is due entirely to the shortage of labor and every day's delay in harvesting the crop increases the aggregate loss. This is typical of most of the plantations.

Coming Crops Endangered.

"Serious losses are now being entailed in the 1922 and 1923 crops, owing to lack of labor to make the plantings and attend to the proper cultivation, which must be done now."

John D. McKee, chairman of the board of the Mercantile Trust Company, stated that he was satisfied that relief for the labor shortage in Hawaii was urgently needed, and that he hoped Congress would pass the bill which will enable the President to grant admission to such numbers of Chinese as will ensure sufficient labor for the plantations.

"I can see no objection to this," he said, "provided only they are barred from the mainland."

Rollo V. Watt, chairman of the Hawaiian supervisory committee of underwriters, saying that the insurance companies had a vital interest in Hawaiian prosperity, expressed the conviction that the labor situation is such as to justify the granting of relief. The present situation, he declared, jeopardizes American interests.

TRUE TO LIFE

Nordhem Connective Advertising from the Public's Point of View.

When a woman buys a new gown she likes to see first "how it looks" upon a model.

A man doesn't purchase an automobile until he's tried it out on the road.

It's hard to sell anything when the buyer can't see in advance just how it will show up in actual use.

The Manufacturer's Name and Brand Occupy the Imprint Space.

It's the recognition of this principle that will add such unusual interest to the display of the Ivan B. Nordhem Company at the Buffalo Exhibition.

The background of this exhibit will be a large rural landscape painted in oil especially for this occasion by the well-known artist, August W. Hutaf. In this realistic setting will stand an exact reproduction, in miniature, of a 24-sheet poster board, containing one of the Nordhem "Big 6" ice cream posters de luxe for the 1922 season.

Naturally the ice cream manufacturer who's going to use posters to advertise his cream wants to know just how his poster is going to look to the passer-by.

One of the Nordhem "Big 6."

So here's his poster-board, true to life. And the Nordhem representatives in charge of the exhibit will be glad to change the advertisement on the board to show him how the other five of his "Big 6" posters will appear.

Other features of the famous Nordhem connective campaign will be on display at Buffalo, in addition to the "Big 6". This means all forms of ice cream advertising—from window cards, cut-outs, posterettes and car cards, to souvenirs and newspaper copy.

The ice cream manufacturer who has not decided on his advertising policy for 1922 will find it well worth while to get acquainted with the Nordhem men at Buffalo—and with their poster board display.

No one talks so much about the enormity of gambling as the fellow who tried to beat the game and failed.

SUPPLY MEN RECKON 1921 ICE CREAM PRODUCTION TO AVERAGE INCREASE OVER 1920

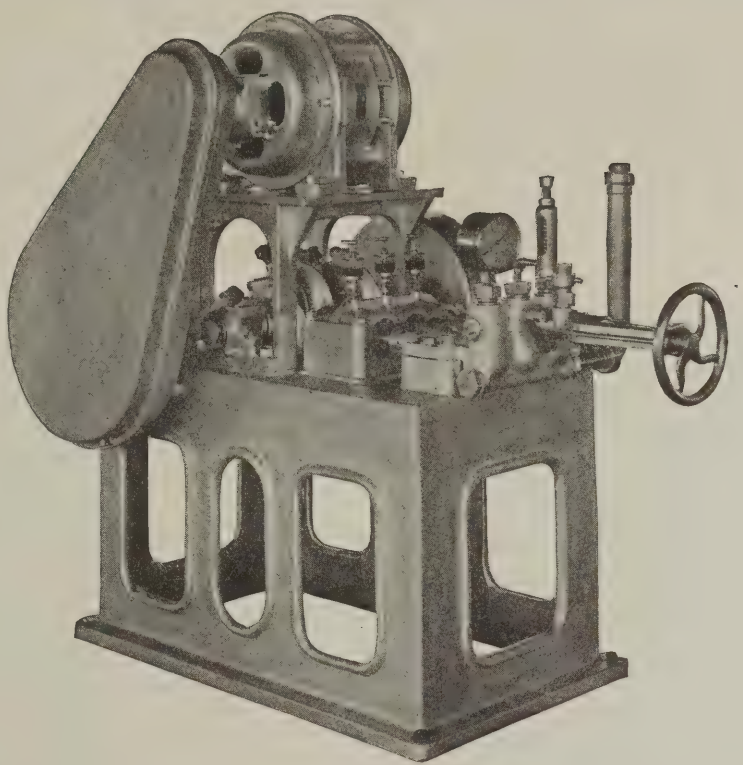
In a Confidential Printed Bulletin issued to its members October 10th, The Association of Ice Cream Supply Men reports in some detail concerning conditions which have characterized the ice cream industry and which have governed the houses supplying its machinery, supplies, equipment and services during 1921. Part of this report to its membership, concerning the estimated production of ice cream up to and through the first few days of September has been released for general publication.

"Many conflicting opinions are current concerning the volume of production," says the Association bulletin, after first referring to the abnormal alternation throughout the season of warm and cold periods. "The Association is in receipt of manufacturers' reports, in general or comparative terms, not in actual numbers of gallons, from almost all sections of the United States. It also has received reports in terms comparative of this and last year's business from Association members of nearly all of the general groups of manufacturers comprised, i. e., machinery, equipment based on metal, extracts, gelatines, miscellaneous supplies, packaging, shipping and motor delivery equipment, etc., etc.

"On the basis of these reports production up to September 10th by sections and in terms of comparison with 1920's terms of production would be: New England, a possible slight decrease; the Eastern states, unchanged, unless by a slight advance; Mississippi Valley, a slight advance; the South, a falling off of a possible 15%; the Southwest, unchanged; the Northwest, at least some advance; the Pacific Coast, an advance. With production included for the balance of September, during which warm weather prevailed, it is safe to modify each of the above in the direction of greater production, and to estimate the year's total production up to October 1st as in advance of 1920 for the same months."

The bulletin also contains the following interesting comments on sentiment within the industry as it has been observed by supply men coming in contact with ice cream manufacturers:

"Whether in relation to his possible success in achieving operating economies, to next year's probable demand or to his standing today as compared with general business conditions, it is to be noted that the ice cream manufacturer in every section is a definite optimist at present. The following, a report made to the Association by an ice cream manufacturer speaking from a territory in which a decreased production was reported, is a definite expression of this attitude:



" 'We contemplate the purchase of more tubs, cans, machinery, and other equipment than we have in any previous year, for we have a belief that there is bound to be a decided turn sooner or later and with it a lot of ice cream business, and we are going to try to be ready for this business when it comes.' "

ICE CREAM BY WEIGHT

Elizabeth, N. J.—A resolution urging William J. Bender, sealer of weights and measures, to bring the question of selling ice cream by weight rather than by measure before the state convention of the New Jersey Department of Weights and Measures, to be held at Trenton, N. J., and to take steps towards bringing about legislation whereby manufacturers will have to sell their ice cream by weight, was adopted at the regular meeting of the Retail Ice Cream Dealers' Association of Elizabeth.

Many Gaulin Homogenizers Are Used 10 Years or More

Users of Gaulin Homogenizers will all testify to their unusually long life, even when subjected to severe service. No plants in the country demand more work out of their homogenizers than the Abbotts Alderney Dairies, Philadelphia; The Ives Ice Cream Co., Minneapolis; Tait Bros. Springfield, Mass.; McBride Bros. & Knobbe, Chicago, or the Waterloo Ice Cream Co., Waterloo, Iowa. Yet each of these concerns and many others have used their Gaulin Homogenizer for 10 years or more. In each case the Gaulin is still in service and good for many more years of satisfactory work.

The Secret.

What is the secret of the exceedingly long life of the Gaulin as compared to ordinary machines of this type? Why does it give such long service and such continuous service, free from breakdowns.

There is no secret about its wonderful durability. It is simply the result of proper designing, the use of carefully selected materials, and having each part made and assembled by expert craftsmen.

If you will examine the Gaulin you will find it as carefully made as the finest custom-built automobile. Each part is made with precision machinery and must fit to the thousandth part of an inch.

And remember the Gaulin is the only homogenizer equipped with the Gaulin Spring Homogenizing Valve and Head.

Everything You Will Need at the Buffalo Show

By Cherry-Bassett Company, Baltimore

WHY are you going to the Buffalo Exhibit of the Association of Ice Cream Supply Men? There are a good many answers to that question and we'll say now, before you offer your reply, that you are correct. In fact you couldn't give a wrong answer. The ice cream industry has reached a recognized standing of national importance and as a logical sequence conventions and exhibits must be held more or less frequently, just as in other important fields of industry, in order that the individuals engaged in the business will not drop into the much talked of rut. Most of us who are concerned with the ice cream industry are fully aware of the necessity and benefits of exhibits.

The Buffalo Exhibit will permit not only a mingling and exchange of ideas between ice cream manufacturers, but you can see, feel, taste, measure, price or operate hundreds of new devices, methods and machinery, thus making comparisons under ideal conditions and also absorbing valuable ideas that are hard to price in dollars and cents.

View in Plant of Teck Food Products Co., Pittsburgh, Pa., Showing Hendler Can Trucks Filled With Cans and Superware Brick Slabs. Note Also the Pile of Superware Brick Tanks in the Left Foreground.

Because the ice cream business has grown so rapidly and is still such a young industry, there is right now, a wealth of new methods and new machinery that is constantly developing. Machinery or methods looked upon as extreme and radical 15 years ago are now antiquated. And we suspect that many of the things exhibited at Buffalo this year will be ancient objects of history by the time aeroplanes start their regular express delivery of ice cream.

The experiences of our organization bear out this belief. We usually keep two jumps ahead of the industry as a whole, in developing new equipment, etc., and this means keep everlastingly at it. We have been able to anticipate the requirements of manufacturers in a variety of ways. Our Superware line embodies a group of equipment for ice cream plants that has kept in the lead ever since we started to produce Superware, and we expect it to KEEP in the lead. This Superware line comprises brick tanks, moulds and slabs; tin spoons, tin carry-out cans; the Hendler Patent Can Truck and the Thomas Batch Measure.

This last device is the latest addition to the Superware family. Without attempting to boast, we sincerely believe the Thomas measure is worth a trip to Buffalo if you see nothing else. You certainly want to see a device that is being hailed everywhere as a wonderful improvement that should not be ignored, and which is quickly being installed once the whole story of its functions has been explained. It really does revolutionize freezer rooms, by making the mix feed to the freezers automatically and by counting the batches. It keeps the mix unexposed and prevents waste, slop and saves the time of employees. That's a lot to say about one single device, but we learned that it would do all these things from concerns who now operate them—we THOUGHT it would do them, and now KNOW it.

Just before we developed the Thomas batch measure we were devoting a lot of time to the brick ice cream problem. And we covered the ground from A to Z—not alone, but in co-operation with manufacturers. The sizes, shapes, and construction of Superware for bricks have been arrived at by thorough experiment and by following the concensus of ideas of the largest ice cream manufacturers. We often wonder if the average purchaser of goods of this sort ever realizes that an enormous amount of time and effort was utilized to perfect each article and make it adaptable to all conditions. Take the Hendler patent can truck for example. This truck is the result of an idea one manufacturer had. We worked at the problem until we now turn them out in lots of 50 at one time and designed so that they suit everybody.

The demand for the unique Superware line has sprung up rapidly. At times we have had to struggle during the rush season to turn out the flood of orders on time. However, we now have a new factory for Superware production, operated by an associate, the Rosenfeld Mfg. Company, and this should lessen such congestion. The plant consists of three buildings occupying one whole block in Baltimore and such a plant of

More Money In Every Sale

There's more *profit for you* when you sell ice cream out of an ECONOMY CABINET—because it costs you less for icing. Then it costs less in the first place and wears longer than most other cabinets, so it saves you money all the time.

"THE ECONOMY"

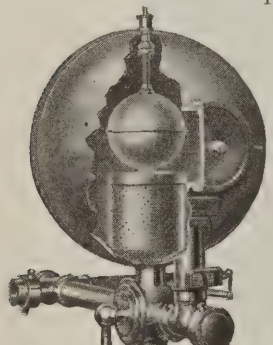
Ice Cream Cabinet

is fast taking the place of more expensive styles because it appeals to careful dealers. Made in mahogany and other finishes and coated with waterproof varnish. Insulation is finely graded granulated cork, protected by waterproof felt. Picture shows an Economy Metal Lined Cabinet. Made in from one to four compartments, 12 to 20 quarts. Ask about "Economy" Packing Tubs.

Write or wire for catalog and prices. Prompt shipment if you order at once.

HOMER MFG. CO.

HOMER CITY PENNA.



course gives us much greater capacity for production in this line. The Thomas batch measures are also manufactured here.

We have seen the need of an automatic ice cream brick cutter that is small enough for the majority of plants and large enough to do the work in a proper way.

View of One of the Buildings Belonging to the New Superware Plant at Baltimore.

This "happy medium" was located in Oshkosh, Wis. Its name is the "New Era" and we will have one on exhibit at Buffalo. We are promoting the sale of these machines in the east, and are sure enough New Eras will be found in eastern plants before many months, to cut bricks enough in a single day to pave the streets of Buffalo.

Thomas Budd Batch Measure.

Of course we're going to let you see Cherry pasteurizers, batch mixers and freezers at the Buffalo Exhibit. There is no better way of acquainting you with the merits of these well known machines than to exhibit them for you.

From this outline of what our exhibit will be, you may judge whether or not your attendance at the show will be profitable. Our exhibit will be typical of many.

NOTICE TO THE TRADE

It has come to our attention that certain firms have or contemplate the purchase from jobbers of apparatus from our general laboratory line for the purpose of creating a fragmentary milk tester, to carry on our patented methods of testing milk and dairy products for fat and total solids content. Our methods are fully covered by United States Letters Patent and such purchase and purchase of parts, either from us or from a jobber, does not give to the purchaser the right to use such parts to carry out our patented methods and processes. Any such efforts to carry out our methods and processes will be considered an infringement of these patents and will result in action to protect our rights and punish the infringers.

We may also add that our tester is designed, after years of experimentation experience, to accurately and quickly test milk for the fat and solid content thereof and that the results obtained by these infringing apparatuses are neither concordant or reliable, due to the incompleteness and inefficiency of the apparatus.

MOJONNIER BROS. CO.

THE DAY OF BETTER ICE CREAM HAS COME.

By Howard W. Black,

With The Widler Company, Cleveland, Ohio.

Ice cream manufacturers of the country are looking forward with special interest to the Eastern Regional Exhibition of the Ice Cream Supply Men, to be held at Buffalo, October 31st to November 5th. At no time in the history of the ice cream business has it been more imperative for ice cream men to get together and exchange ideas as at the present time. The fact that, during the past year, a great number of ice cream manufacturers report a slight loss in gallonage in spite of the extremely warm weather we have had this summer, proves conclusively that different methods must be pursued in order to get an increased business for next year.

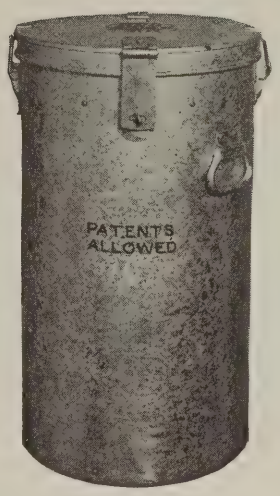
During the war, the ice cream manufacturer's problem was not in selling ice cream, but in getting raw ingredients with which to manufacture same. He used substitutes for sugar, substitutes for flavor, and the extreme demand for his product acted as a substitute for salesmanship. The past year has been entirely different due to the fact that at least 40 per cent of the potential consumers of ice cream have been lost to the manufacturers, due to the money stringency, and to the high prices which retailers are still charging in most sections of the country.

We believe that the trend of ice cream business the coming season will be toward producing better ice cream instead of cheapening their product, in order to get the maximum gallonage. The ice cream manufacturer now realizes that there are a great number of people, through loss of work, who are unable to buy his product and in order to get the same amount of gallonage, or an increase in gallonage, it is necessary to make his ice cream so much more tasty and appealing that the people who have the money to purchase his product will eat more of it.

The Widlar Company, of Cleveland, has anticipated this change in the ice cream business. They have realized that the time is past when a manufacturer is satisfied with just "getting by". We realize that the consumer will go past one man's store to buy ice cream at another's, if the other man's ice cream tastes better. And for these reasons we are going to have on display at our booth at the Eastern Regional Exhibition at Buffalo, our C. W. Brand Vanilla.

If your ice cream tastes better than your competitor's, it must be better. This is the logic of the ice cream consumers. We extend a cordial invitation to all manufacturers who are going to attend the convention at Buffalo to call upon us at our booth and allow us to demonstrate to them the fact that it is really possible to make a better ice cream by using a better flavor.

Toot-Toot!



A sufferer who lived close to a railroad yard in the suburbs wrote the following to the railroad company complaining about the racket made by a switch engine:

"Gentlemen: Why is it that your switch engine has to ding and dong and fizz and spit and bang and hiss and pant and grate and grind and pull and bump and chug and hoot and toot and whistle and wheeze and jar and jerk and howl and snarl and puff and growl and thump and boom and clash and jolt and screech and snort and snarl and slam and throb and roar and rattle and yell and smoke and smell and shriek like hell all night long?"

Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Iceless Express Container.

What Would it Save for You?

Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover

Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical ways in which they help to develop business.

TIMES BUILDING Room 1001 NEW YORK, N.Y.

The Express Situation

Address of FRANKLIN D. JONES, Counselor-at-Law, Washington, D. C., before the National Association of Ice Cream Manufacturers, Minneapolis, Minnesota, October 12, 1921.

The heavy increase in freight and express rates the past several years, with their resulting increase in the cost of living, has emphasized both to shipper and the public, the importance of transportation as an element in the cost of commodities. Manufacturers have learned that rates can operate to seriously curtail their business, even though their competitors pay the same rate. The public has learned that heavy increases in transportation costs must reflect themselves in the price to the consumer. The burden placed upon the distribution of goods by our excessive freight rates, the powerful influence of rates in restricting competition, the break down of the railroads during the war necessitating government operation, have all operated to focus attention and crystalize the demand for the restoration of our transportation service to an efficient basis as a pre-requisite to the re-establishmen of sound industrial conditions in the country. Unfortunately, the infinitely greater importance of the transportation of freight and passengers so far as the economic and social welfare of the nation is concerned has caused the express situation to be almost entirely ignored in public discussions.

FRANKLIN D. JONES

Yet the break down of express transportation was, if anything, more complete than that of freight transportation, the country at one time being threatened with a temporary complete elimination of express service.

After the government assumed control of the railroads, the Director General refused to carry out the separate contracts between the various railroads and express companies under which the express business had theretofore been conducted, but advised the companies that if they would form a single corporation, he would make a contract with that corporation to conduct the express business as the agent of the Director General. In June, 1918, the four main companies entered into such a contract with the Director General and organized the American Railway Express Company, exchanging all the property devoted by them to the express transportation business, estimated to be of a value of $30,000,000, together with $3,000,000 in cast for working capital for stock of the American Railway Express Company. The authorized issue of capital stock of the new corporation because of certain additions and betterments made subsequent to the time of valuation, aggregated $34,642,109.64. The Transportation Act of 1920 gave to the Interstate Commerce Commission the authority to authorize the permanent consolidation of these express companies into the one company, the American Railway Express Company, and the Commission exercised this authority by its decision of December 7, 1920. Wartime demands for equipment for use in the movement of troops and supplies, forced the new express company to utilize very unsatisfactory equipment, moving on slow trans, and a large amount of government business was moved which would ordinarily have moved by freight. In addition, the wages paid by war industries, as well as the draft, deprived the company of the services of many of its most experienced men. The express company has claimed, however, that the services rendered by it under these conditions was far better than would have been performed by the original companies because the unification of facilities under one management permitted better distribution of the facilities and made possible many economies impossible under separate operation, such as the elimination of duplication in pick up and delivery service, duplication of office, and so on. Economies resulting from unification, the company asserted before the Commission, reduced the cost of operation over $13,000,000 per annum. Whatever may be the merits of the consolidation of the express companies into a single monopoly, it is generally admitted that the break down in express service was complete. Loss and damage claims which, between 1911 and 1916, fluctuated between $2,000,000 and $3,000,000 jumped until for the year 1918 they totaled over $22,000,000, or over 9 per cent of the total express charges. The elimination of the check-up system, as well as other conditions, resulted in unparalleled theft and loss. The pick up and delivery service in many industries was almost entirely abandoned. In the Express Rate Case, we presented to the Commission evidence showing that out of 372 ice cream manufacturers located in all but three of the states of the United States, no pick up service whatsoever was accorded 235 shippers, while the remaining 137 received only a limited service. The delivery service on empties was equally bad. Meanwhile, the deficit facing the express company was mounting up at an appalling rate.

The express company in March, 1920, filed a petition asking for an average increase of 25 per cent over the existing rates. The Association opposed this increase because we felt these shippers should not be penalized for the manifest inefficiency of the carriers as shown by the excessive loss and damage claims and the complete break down of its service, and secondly because we did not feel it just that the ice cream industry should pay for a pick up and delivery service it did not receive, nor assume through increased rates, the burden of paying the large loss and damage claims of other industries when such claims in the ice cream industry were insignificant. In co-operation with a number of other industries, we succeeded, after a hard fight, in holding this increase to 12.5 per cent.

Immediately following this decision, however, the United States Railway Labor Board by two decisions, in July and August, 1920, increased the wages of various classes of express company employees, whereupon the company petitioned the Commission for a further increase and the Commission allowed an increase in rate of 13.5 per cent to cover this wage increase. This increase was, of course, not combatted by the Association.

At the same time, the general express rate increase case was submitted, the express company also peti-

tioned for changes in the official express classification. The two changes affecting the ice cream industry was first, a proposal to increase the estimated weights of ice cream on a five gallon shipment, for example, from 100 pounds to 115 pounds, and on other size shipments correspondingly, and secondly to increase the charge for the return of five gallon empties from 16c to 20c, and for empties exceeding that capacity from 27c to 35c. These charges in practical effect threatened a very heavy increase in rates. We lost the fight as to estimated weights but won our fight against an increase in the rate on empties.

The arrangements made between the Director General and the express company covering express traffic expired on September 1, 1920, and prior to the expiration of this contract, the Association of Railway Executives and the express company filed a petition with the Interstate Commerce Commission asking for the approval of a proposed contract to be entered into by them regulating transportation of express. A contract of the character proposed at that time was in the nature of a pooling arrangement and under Section 5, paragraph 1 of the Interstate Commerce Act, such an agreement is prohibited unless the Commission is of the opinion that such an agreement is in the interests of better service to the public or economy in operation and does not unduly restrain competition. Under this contract, the carriers are divided into four groups, Eastern, Southern, Western and Mountain Pacific. By this contract, after deduction of expenses, the balance remaining is to be distributed as follows: 2½ per cent to the express company and the remainder among the railroads in their respective groups in the proportion that the gross express transportation for the month earned on the line of each such railroad bears to the gross express transportation revenue earned on the lines of all such railroads for the month in that group. In the event that the 2½ per cent set aside for the express company exceeds 6 per cent of the average value of the entire real property and equipment and other capital of the express company, involved in the express business with specific exceptions such excess profit is to be divided one-half to the express company and one-half to the other carriers. One-half of this proportion of profit accruing to the express company is to be accumulated by the express company until such a sum equal to 10 per cent of the value of its entire real property equipment and other property employed in the express transportation business shall have been reached after which any such profit is to be divided in the ratio of one-quarter to the express company and three-quarters to the carriers. This contract, therefore, is in effect a cost plus contract permitting the express company from all revenues received to pay its operating expenses and deduct a 6 per cent return on the value of its capital employed in the express business. If its 2½ per cent of the remainder after deduction of expenses runs over 6 per cent, it gets one-half of such excess. Before this contract was entered into, the railroads received approximately 50 per cent of the total revenue. In March of this year, it was reported that on the basis of the new contract, the Eastern carriers were getting 27 per cent, the middle states carriers 40 per cent, the mountain pacific group 53 per cent. The Eastern carriers were not getting a satisfactory revenue because of the high cost of express operations in the way of terminal operations, pick up and delivery service and the large amount of short haul business. The railroads have appointed regional and divisional committees, which are operating in cooperation with officials of the express companies apparently with the idea of reducing, if possible, the operating costs of the express company so the carriers will have a heavier participation in the revenues.

The ice cream industry was more recently threatened with a heavy increase in rates through a proposed heavy increase in estimated weights. An Eastern manufacturer of a patented dry refrigerator container filed complaint with the Commission claiming that the estimated weight granted his company by the express company was unduly prejudicial as contrasted with the weight allowed on shipments in the regular tub container. In view of the extensive hearings and heavy expenses to which the Association had been put in the Classification Case, it was naturally assumed by Association officials that if any prejudice existed, it would be corrected by lowering the estimated weight on the patented container. Under the Transportation Act of 1920, however, the Commission has the power to fix minimum as well as maximum rates and the power to order a carrier to remove a prejudice or discrimination by increasing the lower rate. The examiner in this case on a most incomplete record rendered his report directing the removal of the prejudice by increasing the estimated weight on ice cream shipments to 140 pounds. After considerable effort, even though the examiner's report had been rendered, we secured permission to intervent in this case, to file brief and to make oral argument. While it was our expectation that it would be necessary to have a rehearing and produce extensive evidence in various parts of the country, we were very fortunate in procuring a modification of the examiner's report from the Commission with the result that the express company was ordered not to increase the estimated weight on tub shipments above that at present obtaining and was also directed to establish an estimated weight on the dry container of 75 per cent of its gross actual weight. In this case, we therefore accomplished two very important results. First, the ice cream industry was saved from an increase in express rates of approximately 30 per cent; secondly, the principle was definitely established that a dry container was entitled to a 25 per cent reduction for refrigeration which, in the event a practical container is devised, will be a tremendous saving in transportation cost to the ice cream industry.

This brings the express situation down to date. There is an insistent demand throughout the country that the carriers should reduce their charges so that normal industrial conditions may be more quickly established. Although it may be inconsistent to demand it when under our regulatory system the carriers are limited to a small percentage of profit in times of prosperity, yet it has been felt that the carriers should bear a portion of the burden of the period of depression and that the reduction of rates would be both a sound business move on their part from the standpoint of revival of traffic and business but also a politic action from the standpoint of maintaining the good will of shippers. Up to very recently, the carriers have been bitterly hostile to any general reduction and the Interstate Commerce Commission has apparently viewed any such action with disfavor. President Harding, however, in conference with the Commission is reported to have indicated his feeling that rates should be reduced for the good of the country, and since the resignation of former Chairman Clark, and the new appointments, it is rumored the Commission looks with more favor upon rate reductions. It is the opinion among newspaper men in Washington rather closely in touch with the situation that the carriers, in response to the feelings of the administration, are

THE SCHOTT BROS. COMPANY

"If Made from Canvas We Make It"

WEST SALEM OHIO

about to make a reduction in freight rates. Every reason which argues for a reduction of freight rates applies to a reduction in express rates, particularly in those industries which are dependent almost solely upon express transportation for the distribution of their products. There are in fact added reasons for the reduction of express rates.

Labor costs have been substantially reduced. The express company was given a 13.5 per cent advance in rates in September of last year solely on the basis of the increase in labor costs resulting from the award of the Railroad Labor Board, in August, 1920, which granted an increase of 16c per hour, forcing an additional cost on the express company of $30,000,000. In the recent decision of the Board effective August 1, the wages of employees were reduced 6c per hour. This decision affects some 70,000 to 75,000 express workers. The present award is estimated to have reduced the labor costs of the express company approximately $8,000,000 a year. About 27 per cent of the pay increase which resulted in the 13.5 per cent rate increase has thus been eliminated by this decision which of itself would warrant a rate reduction of over 3½ per cent.

The loss and damage claims which in 1919 represented the inexcusable figure of over 7 per cent of the total express charges have also been tremendously reduced. For the month of June of this year, as contrasted with June, 1920, there was a reduction in number of claims from 163,790 to 57,193,—a decrease of 106,597 claims, or a 65 per cent decrease. The decrease for July, 1921, as contrasted with July, 1920, is 66.1 per cent. On the basis of the percentage of expense incurred for loss and damage for 1917, the last year on which figures are available, a 66 per cent reduction would justify a reduction in rates of nearly 5 per cent.

There is no doubt too that there has been a great decrease in the cost of equipment and supplies, such as automobiles and general office supplies, which have lowered the cost of operation of the company.

The company claims also that the railroads have greatly reduced the cost of operation by eliminating the operation of special trains for express matter. Two eastern roads are reported to have saved approximately $2,000,000 each by consolidating through express cars in regular schedule passenger trains. Such action, it is asserted, not only made more trains available for express service but also substantially curtailed operating costs. Again the capitalization upon which the company receives its 6 per cent return would warrant careful investigation. This amount was arbitrarily determined apparently as a matter of trade with the Director General and there never has been a valuation of express properties by the government. A minute examination of the elements entering into this capitalization might establish that the express company was getting a very handsome return. The community of interests if any with supply companies and other factors tending to increase costs of materials might also tend to show inflated costs.

The express company is in a vastly different position than it was a year ago. Then it was failing utterly to handle business offered. It is now reported that it can handle 30 per cent more business than it is doing without adding in the slightest to its present facilities and that its capacity for the handling of future business is almost unlimited. A year ago its losses were staggering. Now, the very depressed industrial conditions has been making money. For the last quarter of 1920 and the two quarters of 1921, it has declared dividends at the rate of 6 per cent. Under the cost plus contract under which it is operating, there is of course endless opportunity for the concealment of profits by their diversion into new equipment as well as their loss through extravagant operating expenses. However, its record since the rate increase is good. For the last six months of 1920, the total operating revenues of the company have increased over twenty and one-half million dollars. Its operating expenses have decreased over seven and one-half million dollars, and its net operating income has increased over twenty-eight million dollars. For the first six months of 1920 it had a deficit of $27,097,132, while for the same period of 1921, its operating income as already stated was $1,035,609. The latest figures which I have available which are for the months of April, May and June, already show total operating revenues to be running substantially in excess of those of 1920, operating expenses substantially lower and the operating income reaching a satisfactory basis instead of being deeply in the red as in 1920. For the month of June, the last month in which figures were available, the increase in operating revenues over the same month last year was over $894,000, the decrease in operating expenses was over $7,600,000 and the net operating income was $181,594, as contrasted with the deficit for the same month in 1920, $8,321,432. The operating income of the express company in one month as the result of the first express rate increase in August, 1920, jumped from a $7,948,170 deficit to $281,055, and this was in the face of the fact that a number of states have refused to increase their intrastate rates. There is no doubt that upon the present schedule of rates with any revival of business activity, and with reduced labor and material costs, the express company and the railroads will secure excessive and unreasonable returns.

Still another factor which might warrant a decrease in rates is the growing competition of motor trucks. If it could be shown that the present rate policy of the company is unwise, that it is diverting traffic from the express company to a dangerous degree, this too would justify reduction.

There is a very strong demand throughout the country for the repeal of the transportation taxes. There is a strong probability that the tax on freight will be abolished, and if this industry, with other industries affected by the express tax of 5 per cent acts vigorously in the matter it is not at all impossible they will secure the repeal of the tax. Although this tax was stricken from the bill by the house, it has been reinstated by the Senate finance committee.

To summarize the situation as it now faces the shipper by express there are these outstanding facts: First, there has been created through the action of the government in most of the territory of the United States, a complete monopoly of express transportation. It is a well known economic fact that the removal of the stimulus of competition tends to result in deteriorated service, increased costs and generally unsatisfactory conditions. It seems to be the impression, however, that the express company for the present at least is making sincere efforts to reduce its cost of operation and to furnish a more efficient service to the shipper. The company is extending the time limit for filing loss and damage claims to six months as soon as changes in the official express classification can be made. It is holding conferences among its officers throughout the United States for the purpose of standardizing the methods of maintenance and repair of motor service which is the most costly factor of express service; it has installed an efficient tractor and

Insulation is the outstanding quality of "perfection" in Stout-Schroeder Perfection Cabinets. It's the heart of Stout-Schroeder designing and workmanship—every detail conforms to this requirement and adds to its fulfillment.

STOUT Ice Cream Tubs

See that Projecting Bottom—It Is Double

The "Stout"est bottom put into any tub. It projects below the staves, protecting them from the shocks of careless dropping.

Finest close grain cedar treated to provide greater resisting qualities as to water absorption and general rough usage—at the same time making them lighter than others.

Furnished plain, painted or oil treated.

Stout-Schroeder Perfection Tub Lined Cabinets

are insulated with fine regranulated cork, packed by our special process—it's the method of packing that really effects the "complete" insulation.

Stout-Schroeder Perfection Metal Lined Cabinets

are insulated with pure cork board "baked" to confine the air in the cells—it's the "baked-in air" in the cells that conserves the "perfect" insulation values in the cork board.

The "Panel" (smooth surface) 600 Line

to meet the demands of trade to match other fixtures. Regularly finished in Mahogany—but other finishes will be furnished as specified. Either "Tub" or "Metal" lined construction.

The Stout Crate Co. Dept. R 373 BROADWAY **Milwaukee, Wis.**

trailer service in Chicago and Philadelphia for handling the large transfer traffic; it is holding meetings of employees throughout the country, training them to a better knowledge of tariffs, of methods of handling shipments and of dealing with patrons; it is testing out in different localities different forms of receipts to simplify the handling and checking of express packages; it has tremendously reduced loss and damage claims by the installation of proper checking system and there seems to be a feeling that the pick up and delivery service is improving. Whether or not these improvements are an earnest of the future or merely a re-action from the deplorable situation resulting at the close of the war, no one can say. A factor which may aid in securing for shippers the benefits of efficient service from the express company in the future is the competition of motor trucks and in some industries the competition of the parcel post.

The second important factor bearing upon the express situation is the existing form of contract with the carriers which has in it all the inherent danger of a cost plus contract in addition to being based upon a theoretical valuation which may be greatly inflated. while this contract does not necessarily have any relation to rates, the cost of service is a factor in the rate making and greatly inflated costs arising from a cost plus system unless they are most carefully scrutinized and analyzed by the Commission will result in forcing up or maintaining a higher level of rates.

Third, the industries of the country dependent upon express transportation are confronted with a very high level of rates, a level fixed by the Commission to meet conditions which have since been eliminated. The ice cream industry through the increase in rates and increase in estimated weights has been hindered with an increase of about 41 per cent within the past two years. There has been a substantial reduction in labor cost; there has been a great reduction in loss and damage claims; there has beyond doubt been a decrease in the cost of supplies and equipment, yet the express rate remains the same. This situation has always been particularly unfair to the ice cream industry by reason of the fact that the ice cream industry, supplied an insignificant amount of the loss and damage claims and by reason of the fact that the industry received very little pick-up and delivery service which in view of the short haul transportation on ice cream assessed on the industry a charge which represented a substantial percentage of the transportation cost, but for which no service was rendered.

Fourth: Express shippers are still confronted with the question as to whether or not any proper limitation can be made upon the type of commodities which shall move by express. It seems unfair that commodities which should naturally move by freight in periods when express facilities are inadequate should be permitted to utilize such facilities to the exclusion of shippers who have no other practical method of shipment. The express company apparently makes no limitation upon the type of commodity it will ship, having recently even shipped elephants by express.

It is our understanding that the bread and baking industry is considering the possibility of filing formal complaint before the Interstate Commerce Commission asking for reduction of express rates. If the members of this Association are seriously affected by the existing express rates, I have no doubt that it will be possible to secure the co-operation of a number of other industries who are affected in a similar way. With the general movement in this country toward the reduction of freight rates, with the recognition by the railroad executives that rates must be reduced in the interests of the public and in the interests of the railroads, there would seem to be no reason why the officials of the express company should not recognize the wisdom and the justice of similar action.

HOOSIER WILD CATS

President, EDWIN J. SMALL, Indianapolis, Indiana

Send all communications to H. A. STEVENS, Sec'y and Treas. 717 Railway Exchange, Chicago, Ill.

E. W. Razey, Indianapolis, Ind., a popular and well-known Wild Cat writes that he wasn't able to attend the National Dairy Show this year because he was so d—n busy down in his district trying to take care of business in sight. "Things are sure humming down here," he says and we are glad to hear it. We hope the "hum" isn't just the birds migrating south for the winter—but then we know that there is business to be got, Razey of the Wild Cats will get it.

* * *

Razey, a good friend of yours to whom we related your predicament calls you a —— he says you're mistaken. He said during the Dairy Show there won't be any business in sight in Indiana. Was he right?

* * *

Harry L. Wagner, a well known and well liked Wild Cat, who used to be located at 1442 Conway Bldg., Chicago, Ill., and was an able representative for The Pfaudler Co., Rochester, N. Y. has left their employ and regrets very much that he was not able to be at the Twin Cities in attendance at the "Big Tent".

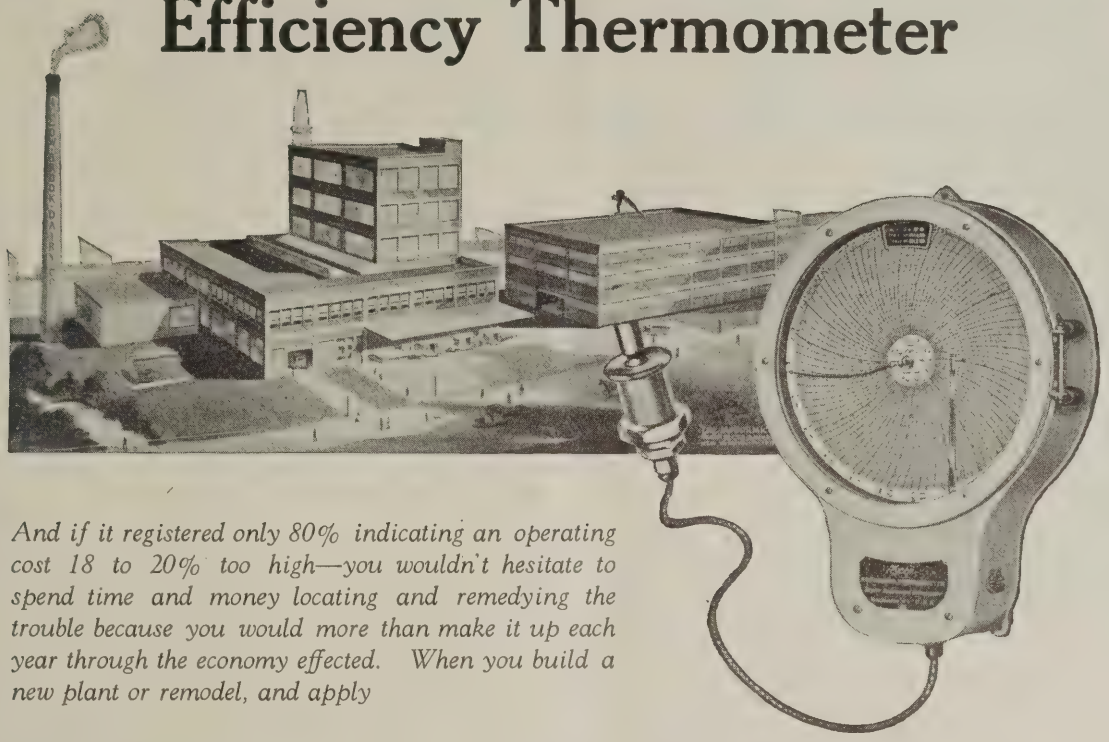
He is now in the brokerage business at St. Louis, Mo., and is with his home folks. He sends his regards to all his dairy friends.

⚜

THE WYANDOTTE INDIANS WERE THERE.

The Wyandotte Indians were found to be strongly encamped in the heart of the "National" when the curtain of the big show went up. They carried out their old tradition and gathered together at the big pow-wow to meet old friends and to make new ones.

Everyone visiting their tepee found a friendly "Indian" to help him with his dairy cleaning problems, and no one went away feeling that the time was not well spent.



Just as in past, everyone who called at the Wyandotte wigwam was presented with a little token of friendship, and each person asked to use it as a reminder during the coming year to tell our friends and neighbors that we are going to the National Dairy Show in 1922.

Wyandotte Dairyman's Cleaner and Cleanser was represented by: J. J. Harris, Manager of Cleaner and Cleanser Dept.; C. B. Robinson, Assistant Manager of Cleaner and Cleanser Dept.; H. J. Willwerth, E. R. Hansen, H. W. McElroy, C. S. J. Gray, C. L. Lambert, N. D. Gordon, W. G. Farrish, C. C. Lowitz and Chief Little Bear.

Hand-painted china is a pretty feature of housekeeping, but hand-mended stockings will produce more happiness in the family.

If Your Plant Were Attached to an Efficiency Thermometer

And if it registered only 80% indicating an operating cost 18 to 20% too high—you wouldn't hesitate to spend time and money locating and remedying the trouble because you would more than make it up each year through the economy effected. When you build a new plant or remodel, and apply

McCormick ARCHITECTURAL AND ENGINEERING *Service*

you are taking the maximum precaution against building deficiencies into your plant which are bound to run operating costs up and hold production volume down.

It is a highly-developed and skilfully applied service which concentrates intensively upon your own peculiar conditions and problems and leaves nothing to speculation or chance.

Our long experience of successfully solving ice cream and dairy plant problems is an important element of McCormick Service which should be considered. It is a well known fact that efficiency in McCORMICK SERVICE plants registers high and that the cost of the service is more than made up each year by the numerous construction and operative economies effected by its application.

It may be to your advantage to confer with us before going ahead with your work. There's no obligation whatever in discussing your problems with us, either by mail or personal conference.

Packaged Ice Cream

By C. E. ROGERS, Detroit, Mich., before National Association of Ice Cream Manufacturers, Minneapolis.

We have seen many ice cream wagons this summer carrying the slogan "Science — Service — Sanitation." Unquestionably every one of you believe in these three cardinal principles of handling food products, whether you advertise it in this form or not. This very slogan, "Science — Service — Sanitation" seems almost synonymous with "Packaged Ice Cream."

C. E. ROGERS

Science, as applied to the manufacture of food products means better products at a cost that makes service and sanitation possible. Service is the ability to place your product within ready access of the greatest number of people. Sanitation is your guarantee of the cleanest possible food and is just as important as your service and the result obtained from your sciences. Just why any one would wish to purchase bulk ice cream after once having used the cleanly and neat package that brick cream comes in, is beyond my comprehension.

I know that the American people, in fact all peoples, are creatures of habit, and once their minds are grooved along certain lines, it is pretty hard to pull their thoughts out of the rut. Therefore, the only excuse that I can find for bulk ice cream is the fact that people become accustomed to buying it before the brick was available for them, and have still continued doing so through the force of habit.

And now, may I pass from the customer to the dealer for a moment or two?

It is quite evident to me that the retail dealer who sells only bulk ice cream is either lacking good sense, or does not make use of what gray matter he is endowed with. Why a dealer will serve bulk cream to his trade instead of the brick package, when he positively knows of the shrinkage in bulk ice cream, and the waste in serving it, is also very hard to understand.

And while taking a "fall" out of the customer and the dealer, I might just as well at this time make a "three-base-hit" by landing on the manufacturer. He, it is, who in the past has discouraged the use of the brick and encouraged the use of the bulk, because he assumed that there was more profit in the one than in the other, and for the further reason that it was an easier handled product, and because possibly the brick entailed a little more of an organization, a little more investment, a little more trouble. That he was continually stepping on his own feet never seemed to strike him for a moment, for with the exception here and there, the average manufacturer has failed to realize the relationship between a brick package served to the customer neatly and cleanly, a pail of bulk cream, and increased sales.

Were we to stand here and say to you that crackers or macaroni were as valuable food products as ice cream—that they were as generally used by small children and invalids—every one of you would disagree with us, and rightly. We don't believe they are, and neither do you. Yet I cannot help but compare the present bulk ice cream cabinet with the old-fashioned cracker barrel. You reach below the counter, remove the lid, and scoop out what you want. You do that to-day with ice cream. They do it in thousands of stores—but just endeavor to buy a bag of crackers—you can't do it—not because the boards of health forbid it, but because the manufacturers themselves make it impossible. They force the public to buy a sanitary package. The public protested in the beginning—but they like it now—and so they will with ice cream. We do not need to stick to the cracker barrel alone to illustrate this point. What has become of the loose pickles, loose olives, unwrapped bread — in fact, unpackaged food stuffs of all kinds—to all practical purposes they are gone. This is an age of neatness, cleanliness, healthfulness, simplicity of operation—in fact, this is a "Packaged Age."

And what is true of all of the food stuffs mentioned is true of ice cream. The day of bulk ice cream for the consumer to take to his home, is past, and in its place has come that cleanly, wholesome looking, attractive, neat, quickly handled package—THE BRICK ICE CREAM.

The pioneer work in educating the public to purchase packaged merchandise has been done for you. You will reap a rich reward, indirectly the result of publicity work done by other food product manufacturers. The public are educated to purchase packaged merchandise. It is almost a habit with them. Even the pickle barrel is passing on—it may still be in the cellar but we doubt if it is filled with pickles.

Your industry is particularly fortunate. The packaging of most other food products has meant a material increase in the cost to the consumer. Yet, you can now put packaged ice cream in the hands of the consumer without raising the price to the consumer, and allow the dealer a larger, safer, surer profit—a pre-determined profit—that he cannot get on bulk ice cream.

We learned from several reliable sources that the dealer can dip from fifteen to seventeen quarts from a twenty quart packer. One dealer in our neighborhood said thirteen, but that seems too low. The sales manager of one of the largest factories stated that he believed an average of sixteen quarts would be fair. This gentleman stated they were charging the dealer $1.26 per gallon for vanilla cream in bulk. They were charging $1.35 per hundred quart pails. The dealer retailed this cream at 50c per quart. The dealer bought 20 quarts but he only sold sixteen. He received $8 gross for a product that cost him $6.25. He had a charge of 23c for pails, if he dispensed all quarts, or a gross profit of less than 25 per cent, and you know that he didn't make a legitimate net profit, and I believe many of you, in fact most of you, will agree that he didn't.

The dealer is gradually coming to realize these facts. Most of you have some dealers at least that practically refuse to dispense bulk ice cream. The secretary of one of the largest plants in this country told me a few weeks ago that all of their dealers were losing money on the bulk ice cream they dispensed for home consumption. Gentlemen, this condition is

200 Manufacturers For Cleaner, Purer, Better Ice Cream!

Approximately 200 ice cream manufacturers of the United States and Canada are pledged to make cleaner, better, purer ice cream.

They are heeding the United States Department of Agriculture admonition that air is a disastrous ingredient. So, they are making their ice cream without air.

A chain is only as strong as its weakest link. A manufactured food product is only as pure as its least pure ingredient.

Air is loaded with dirt, dust and germs. Whip filthy air into your 100% pure mix and you do **not** purify the air, but you **do** contaminate the mix.

It was an epidemic caused by infected ice cream that started Prof. W. P. Heath experimenting to find a way to make ice cream without air. That epidemic was fatal to two and nearly so to one hundred others. Yet, the plant where this happened was one of the cleanest, finest, most modern ice cream factories in the world. But it happened, just the same.

The advantage in making ice cream the HEATH-WAY is not alone a question of improved flavor — although that counts. It is not alone a question of greater advertising value — although that helps. It is not alone a question of finer texture and better standing up quality — although they count. It is primarily a question of WHETHER OR NOT YOU WANT TO CONTINUE MAKING ICE CREAM WITH AIR THAT IS NEVER CLEAN AND OFTEN DANGEROUSLY IMPURE.

You owe it to yourself to protect your product. You owe it to your dealers to protect their product. You owe it to the people who eat your ice cream to protect them — all of them — from this lurking danger which exists in the air you are whipping into your freezers.

TWO HUNDRED progressive manufacturers have seen the light. Surely you also want the latest that science offers.

Then get in touch with us. You have much to learn about Heathmade Ice Cream. Let us tell you about our method. It does not require any change in your present methods of manufacture or mix. Write to us NOW.

wrong. When the handling of any product ceases to be of profit to the dealer it is human nature that he should not dispense more of that product than is absolutely essential, and that he should turn his attention to the sale of products that leaves him a profit. The dealer is your direct sales representative. He is the one who comes in direct contact with the ultimate consumer. He can help your sales, but you have got to make it possible for him to receive some reward for his efforts. The best of advertising is of little value without the dealer's co-operation.

One of, if not the **most** important phases of your manufacture of ice cream is the overrun or yield. Most of you, at least, hope to average 100 per cent. You sell this yield to the dealer, and it is only fair that you should make it possible for him to dispose of it **over** the counter—not crush it out back of the counter packing it into a pail.

The theoretical cost of that pail to the dealer is $1.35 per hundred pails. The actual cost is nearer $8 per hundred, for he loses the difference in volume bought and volume sold.

You all know that the quart boxes for ice cream will cost materially less than the dealer pays for pails. In fact, the mechanical packaging of ice cream should bring the cost of both package and factory labor to a figure that mould scarcely exceed $1.35 per hundred quart boxes. The dealer buys the empty pails from you now. Wouldn't he rather buy the filled box? Does he get any particular joy from packing ice cream in a pail with a dozen people waiting impatiently to be served at the fountain? Go to a soda fountain and buy a quart of ice cream. Did any of you ever take your watch in your hand and time the dispenser? The average, at four different stores we tried, was just over three minutes per quart—nearly an hour's labor to dispense a 20-quart packer of ice cream.

The argument was advanced us a few days ago that brick ice cream requires more ice and salt. This may or may not be correct—we are not prepared to say. If you undertake to handle your bricks in the same round cans that you use for your bulk ice cream you will undoubtedly use more ice and salt. You cannot pack to exceed three gallons of quart bricks in a five gallon packer. You couldn't freeze more than 40 quarts of ice cream in a freezer in the early days of the industry, but you have changed your freezers, and so you can change your cabinets. A 20-quart packer, to comply with the law, must have a cubical content of 1155 inches. A standard square cave, as used in our city, for bricks, has a cubical content of 1800 inches. This cave will hold 24 quarts of brick cream, or 300 cubic inches to the gallon of brick ice cream. Theoretically your 20-quart packer will hold five gallons, and it will, that is, you can put five gallons into it, but the dealer can only take out four gallons. From a dealer's standpoint, and from your standpoint, this packer cannot be construed to contain more than the dealer gets out of it. The dealer sells so many packages of ice cream, whether he sells it in bulk or whether he sells it in bricks, and if you consider these facts your 20-quart packer is really requiring 289 cubic inches of space to the gallon, and the brick is requiring 300 cubic inches. There is a difference, but the difference is so slight that the additional space required for cabinet room will amount to nothing. Your wagons can carry just as much brick cream in the same space that they do the bulk, for the square caves will pack closer together on the wagon.

Many of you unquestionably believe that the packaging of your ice cream will cut down your volume. This probably is true. You can sell your packaged ice cream to the dealer at a price that will net you considerably more profit per gallon than your bulk ice cream. Your dealer can dispose of this at the same price he is now dispensing his bulk ice cream and show a much larger profit. This will put pep in the dealer, and putting pep in the sales makes them increase. The dealer can figure his profits every day with accuracy, and not have to wait until the end of the season when he gets his rebate check to get his profit. We do not believe any of you are so anxious to increase your volume that you are willing to sacrifice your profits to do it. A reduced volume at more profit per gallon would probably be thoroughly acceptable to most of you. Right in the hot season, with the supply of raw material short, your men, machinery and teams working at their highest pitch, it would seem to us that this saving of a 20 per cent in volume is worthy of your consideration. If we could come to you and guarantee that during the peak of your load we would save you 20 per cent of your energy in shipping, in aging, mixing, homogenizing, freezing, hardening and delivering your ice cream requirements, without reducing your net profits, we believe you would welcome our intrusion.

Of course, I realize that in this audience, like in every other audience, there is the type of man who says, "We cannot do it in our locality, they won't stand for it," or the other fellow who starts to groan about the extra cost of putting up the brick—there are some who will even say that the customer does not want it—that he prefers bulk. They are of the same kind as they who laughed at the railroad train, poohpoohed the automobile, called the telephone a joke, said Marconi and his wireless was the imagination of a crazy man.

We have always had the hang-backer with us, and we always will have him. He belongs to the past age, the present, and the future, and I believe in him, because it is essential that we have him in our midst so that we can realize that the rest of you are of the kind that "Go Forward".

Every one of you sell far more vanilla ice cream than any other. Probably next in volume of sales would come chocolate. We believe that one of the main reasons, and probably the principal reason that the public today buys bulk ice cream is that heretofore it has been impossible for them to buy anything in brick form but a fancy ice cream. The Neapolitan Brick was most generally sold because you made more of it. A great many people do not like the Neapolitan brick. A great percentage of the public prefer the vanilla or the chocolate ice cream. Some few manufacturers during the past year or two have been putting out a packaged vanilla ice cream and a packaged chocolate ice cream. Where this has been done the product has sold readily, and the volume of business in that line has steadily increased. Heretofore, if a customer wanted a quart of vanilla or of chocolate ice cream he had no other means of securing it than buying the bulk product. There is no doubt in the world that if you furnished the dealer with packaged vanilla and chocolate ice cream the sales of these products would materially increase. The principal reason that these products have not moved more readily is that you have not furnished the dealer the packaged ice cream to sell. There have been thousands of dollars spent to advertise the slogan "Take Home a Brick". When the customer went to buy that brick he was forced to accept a fancy brick. If he could have known that the slogan "Take Home a Brick" meant a brick of vanilla or a brick of chocolate, as well as a brick of fancy ice cream, his inclination to take it home

The taste tells the tale

Impruv-Mix Has Stood the Test

Introduced in the fall of 1916, it is constantly growing in favor.

IMPRUV-MIX blends the incited cream flavor with every added flavor and removes all taste of milk powder, butter or condensed milk.

The delicious cream flavor, thus produced has increased sales for every user of this Ice Cream Improver.

"The Taste Tells the Tale"

Write us for further details and our booklet "Quality Guide."

THE IMPRUV-MIX COMPANY

403 W. 24th Street NEW YORK

would have been increased. We want to say to you—put your solid colors in brick form. Get the most benefit from your advertising. When you put in the dealers hands nothing but fancy ice cream you are only reaping part of the benefits that are possible to accrue from the advertising you do.

It is no more labor today to put your ice cream into brick form than it is to bottle your milk. The Brick Filler and its economy of operation is one more element that seals the fate of bulk ice cream. It will behoove you men engaged in this business to get your ear to the ground and listen attentively to what the consumer is thinking of—he speaks a language that most of us can understand, providing our voice of protest is not so loud that it makes it impossible to hear.

Mr. Manufacturer, I am neither a prophet, a seventh son, nor a son of a prophet, but I stand here as one who has been a close student of milk products and the ice cream business over a period of years—one whose perspective has not been blinded by the nearness to the industry—to say to you that the sales of brick ice cream within the next year or two will surpass in every way the sales of bulk ice cream, and further, that before long the sale of bulk ice cream will be prohibited in practically every state in the Union.

The old method of brick manufacture left a difference in the texture of that brick compared to the bulk. The mechanical packaging has eliminated this difference in texture, and how any right thinking person can say that they would prefer a pail of ice cream, dipped out back of the counter, to a neat, clean, sanitary package that is packed in the factory under absolutely sanitary conditions, is a mystery. We do not believe that this habit of buying bulk ice cream is going to last. Packaged ice cream can and will be sold—it just depends upon the effort you put into it.

We have before us a statement from one of the large Eastern manufacturers that during the past five years 27 per cent of their total sales have been brick ice cream. We have a statement of one of the largest manufacturers in the Middle West, that during the past two years the percentage of brick as related to total sales was 7½ per cent. One organization pushed the sale of brick ice cream—the other didn't.

The factory packaged ice cream enables you to put your product into the hands of the consumer just as you would like to have it reach them. The package of ice cream goes to the consumer in the shape in which it left your plant. With the bulk ice cream you do not know what kind of handling it gets after it leaves your wagon. Then again your dealer may get short—it has been known to happen—he will send out to some manufacturer and get a packer of ice cream because he can get it quickly. You had your sign in front of that store, and the man that bought that ice cream thought he had your ice cream. If there was anything wrong with it you got the blame. If there is dust in his ice cream pail when the dealer fills it **you** are making a dirty ice cream. If there happens to be chocolate on the spoon with which the dealer fills the pail of vanilla there is a peculiar looking substance in the vanilla ice cream. You would know it was a streak of chocolate, and the consumer would probably assume that it was, but it breeds an element of doubt in the consumer's mind as to just how careful you are in your manufacturing methods. The boards of health in every village and city in this country require the pasteurization of milk. Every one of you pasteurize your ice cream mix carefully and accurately. But these same boards of health require that all milk going to the home must be in bottles. There isn't one of you that could be persuaded to take your own pail to a store and purchase a quart

of milk dipped out of a can, and yet every one of you will contend that your wife would have her bucket just as clean as the bucket in which the dealer would dispense your ice cream. Milk today is a packaged product. There isn't one of you that would advance an argument that the per capita sale of milk today is not as great, and even far greater, than it was in the olden days of the can, dipper and pail combination.

Every one of you pride yourselves upon the sanitary condition of your plants—everything in them is kept scrupulously clean—you use nothing but the purest ingredients in your product—you watch it carefully from the time the milk leaves the cow until it gets into the dealer's hands, and there the supervision of it ceases with your bulk ice cream. You have not kept full faith with the public unless you protect that cream until it reaches the home. This condition is just like a man changing a tire, and finding that after he gets his spare tire all in place, and let the jack down, that there is no air in the spare tire. He has all the trouble of changing the tire and gained but little from it. This same condition is true of the bulk ice cream—you take good care of it up to the point just preceding its delivery to the consumer, and there your supervision ceases.

We believe that the days of bulk ice cream for home consumption are practically over. We believe that the time is not far distant when the boards of health of the larger cities will require the delivery of packaged ice cream for home consumption. This is probably no wilder dream than it would have seemed had this same prediction been made regarding bottled milk ten years ago.

The conversion of ice cream pail to the ice cream brick may take some time and some effort. We believe the housewife in serving her guests would much prefer to cut neat, clean slices from an ice cream brick and place it upon a plate, to dipping the ice cream from a pail and putting it in a saucer. Every one of you have men in your plant that will cut five, six, seven or eight slices to a quart with almost machine-like accuracy. The housewife can and will acquire this same skill. The brick ice cream will enable her to serve more easily, more accurately, and with far less slop than with the pail. All of you rather like to have your ice cream served at your table in the brick, and sliced at the table, the same as you slice your roast, but can any of you imagine setting a pail of ice cream on the table?

Packaged ice cream may temporarily reduce your gallonage, but it will increase your profit per gallon on the volume remaining. It will go to the consumer in the same cleanly condition that it left your plant. It will carry your name into the home. It will cease to be a sale of ice cream—it will be a quart of your product—not just ice cream. It will save you time. It will give the dealer an accurate basis on which to anticipate his profits. It will save the customer time in making his purchase. And all in all it should, and will, work to the end of making a more harmonious transaction for manufacturer, dealer and consumer.

CUBAN CROP LIMITATIONS MAY REACT ON SUGAR PRICES

Havana.—As time progresses, and it becomes increasingly clear that a considerable proportion of Cuba's sugar crop will remain unmarketed at the end of the year, the question of the policy to be adopted in relation to the coming crop assumes growing importance.

Continued Control Opposed

Expressions of opinion in relation to the continuance of the Sugar Finance Committee or some other central organization in control of the next crop indicate that sentiment generally is opposed to this course. While it is admitted that appointment of the present committee prevented the complete demoralization of the market, there is also a feeling that the operations of the committee have not resulted in the sale of as large a proportion of the crop as might have been disposed of without control. Some of the producers take the position that they would have preferred to sell their sugar for any price that could have been obtained in order to clean up the situation, although they admit that this would have involved the complete ruin of many companies.

Irrespective of differences of opinion as to the wisdom of centralized control, it is recognized that it would be disastrous to end the authority of the Sugar Finance Committee at the present time, or until some definite plan is worked out for the disposal of whatever portion of the past season's production may remain on hand when the new campaign starts. It will be obviously impracticable for the committee to continue the sale of old crop sugars after the new crop begins to come on the market. The treatment of such old crop sugars remaining unsold at the beginning of the next season is one of the important questions that remains to be decided.

Government Purchase Plan Dropped.

Less is being heard than formerly of the proposal that the government purchase the unsold balance of the past crop by means of a loan to be floated in the United States. One reason for this probably is that the internal loan recently authorized by Congress is not moving rapidly and is finding few purchasers at the current price of 60. This is a six per cent loan and was originally offered at 63. Another possible factor is that advices from the Cuban mission now in Washington indicate an apparent reluctance on the part of the Department of State of the United States to authorize the proposed external loan until the expenses of the Cuban government have been cut down further, a step which is advocated by President Zayas but which the Cuban Congress seems reluctant to take.

A plan that has been more generally discussed of late is that of postponing as far as possible the beginning of the next grinding campaign. It is argued that if the commencement of grinding can be delayed until January 15, February 1, or February 15, it will be possible to sell the greater part of the old crop, releasing the funds tied up in these sugars and making them available for the financing of further operations. It is pointed out also that it will have the effect of restricting the output from the 1921-22 campaign and will make it possible to produce the sugar at a lower average cost.

The suggestion has been advanced that the opening of the campaign be deferred and the output restricted by placing a tax of at least two cents a pound on all sugar produced before and after certain specified dates. Such a tax applying, for instance, to sugar produced before February 1 and after May 20 would be prohibitive and would limit actual grinding to the intervening period. It is figured that this would permit the making of a crop of not more than 3,000,000 tons, which would be produced under the most favorable conditions and at a lower cost than if the campaign extended over a longer period.

CARAMALA DISTINCTLY INDIVIDUAL

CARAMALA, the favor compelling flavor, is now, most universally used. Since its first appearance on the market **CARAMALA** has enjoyed a distinct, individual favor by both the ice cream maker and the consuming public

IT IS A TRADE STIMULATOR

CARAMALA Ice Cream is always in season. It produces a smooth, rich, firm cream with a peculiar pleasing flavor that the consuming public likes. "Give me Caramala Ice Cream," is the universal demand and is evidence of the fact, that once Caramala Ice Cream is eaten, "they call for it again."

LET US PROVE ITS MERITS

Send in your trial order, and if any Caramala claim we make is not sustained by your Caramala experience, simply return us the shipment within 30 days at our expense.

Caramala Signs like these furnished. They help increase your business.

A Big Modern Ice Cream Factory

A Story of a Business Success of Absorbing Interest to the Man with a Vision

ASK the native of Stony Gulch, Arizona, or Genteelville Massachusetts, what Milwaukee is famous for and he will mention a business which got a baw slap on the wrist when congressman Volstead got his name in the papers, "first page, double column head".

Ask the citizen of Milwaukee, or any other city who knows the leading industries of the "Cream City" and he will mention other things for which it is famous.

Ask the man who is familiar with the ice cream business the country over and he will promptly tell you that Milwaukee is noted for its many fine ice cream factories, the superior quality of their product and the comparatively low price at which it is sold.

Among several fine, modern ice cream plants in the city is the one owned and operated by Mansfield's Ice Cream Company, 4th and Poplar streets, cut of which appears on this page. A Review reporter enjoyed a visit to this splendid plant one day lately and is indebted to Mr. Geo. D. Mansfield, president, and Mr. Arthur H. Graeszel, secretary, for the many courtesies extended. To go through this fine plant "from cellar to garret" and listen to Mr. Mansfield describe the different apparatuses for conserving labor and insuring a high quality product is a liberal education in itself.

Mr. Mansfield's story is far more than a recital of statistics concerning the operation of the plant. It embodies a human interest element which is absorbing to the man who enjoys learning about a business success. Mr. Mansfield's apparent chief interest in life centers about his organization and the wonderful development of the business in which he has been a prominent figure for over 30 years.

His father, Geo. C. Mansfield, was one of the early pioneers in Wisconsin dairying, having operated creameries and cheese factories for many years with headquarters at Johnson Creek, and enjoyed the distinction of having operated the first power cream separator in Wisconsin. It was a Danish Weston, one thousand pounds capacity. To quote Mr. Mansfield's words, "Brother Fred and I decided that the coming of the hand separator doomed our cheese business in that section and we decided to spread out in the butter and ice cream business. We came to Milwaukee and rented a cheap place in the basement of the Milwaukee Cold Storage Company's plant. We had just room enough for a churn and an ice cream freezer. This was in 1903. Two years later we moved to 4th and Prairie streets where we rented larger quarters. We thought that our business was pretty well provided for, but its unexpected growth soon forced us to look for more space. We purchased a lot 100 x 150 feet at the corner of 4th and Poplar streets, where our present business is located. We started building in the fall of 1907 and moved in the next spring. The original building was 64 x 150 feet. In 1919 we purchased additional ground and built an addition to the plant which makes the entire building 150 x 150 feet, four

Is your package easy to remember?

"Putting the name across" is never an easy job. People do not make it a point to remember your name when they see it. But if the package is so designed that it will arrest their attention, if it is striking—"different"—they will begin to remember it after seeing it the second or third time. And they will associate your name with your product.

Then, too, your package must deliver its contents in good condition. And only a house that has learned, through long experience how to build the best boxes can do both jobs well.

We have designed and made boxes for exacting organizations in every branch of business. For more than 20 years we have been improving the packing methods of business houses thruout the country.

Our service department will be glad to send samples and quote prices.

stories high and basement. The rest you can see for yourself."

A visit through this modern ice cream factory impresses one with the fact that nothing has been left undone to make it practical, at the same time it is a model of sanitation.

It's equipment includes the very best of everything and no expense has been spared to give service to the trade. One also gains the impression that in building the first section of the plant that Mr. Mansfield

Billboard Advertising That Gets Results.

must have had a clear conception of what the business would require a few years later, because the arrangement of the completed plant could not be improved upon.

The two upper floors are used for storing supplies and extra equipment. The second floor is given over to the mixing room, laboratory, ice tank, and general offices. The main floor is occupied by the freezing rooms, hardening rooms and for shipping and brick cutting.

A 100 ton ice tank supplies the necessary ice and 1,000 tons surplus can be carried at one time.

It is not our purpose to explain in detail the many interesting features of this plant. It is rather our wish to emphasize some of the conveniences that are employed. For instance, it is possible to load 16 autos at one time for city deliveries. Crushed ice and salt are carried by endless chains to overhead spouts. The city business is handled from a loading platform 120 feet long and is kept entirely separated from the country shipping business. This elaborate loading platform fronts a space 50 x 150 feet, without a post, which is in reality a big garage. The delivery men back their machines up to the loading platform after making the day's deliveries. If any repairs are needed this fact is reported to the superintendent and the repairs are made by two expert mechanics employed expressly for that purpose. In the "wee sma' hours" the autos are loaded and the delivery man finds his outfit all ready to go when he takes charge in the morning. This obviates the necessity of a detached garage and the loss of time incident thereto.

Over 20,000 gallons of ice cream can be handled in the hardening rooms and space is available for additional capacity when needed. A battery of seven continuous freezers makes up an imposing sight in the freezing room and three more are contemplated before warm weather arrives another season.

Each machine is equipped for making carbonated ice cream, and exclusive local feature of Mansfield's business. An extensive advertising campaign has recently been put on in the city in which a unique voting contest played an important part.

Consumers were invited to guess the three flavors employed in making "The Mystery Brick", each winner to receive a year's supply of ice cream—a brick each Sunday—absolutely free. "The Mystery Brick" was put out as a Sunday special for just one Sunday and over 100,000 guesses were sent in. Sixty-three winners were announced. "The Mystery Brick" contained the three following flavors—vanilla, nougat and mix-fruit. Replies came from Milwaukee and all the adjoining towns and cities and a very pleasing number of new dealers have been added to the company's list of customers.

Billboards advertising was used to back up the newspaper advertising and a large number of painted boards, similar to the one displayed in the accompanying cut, appear at vantage points throughout the city. This same design appears on every ice cream delivery auto used by the company.

The success of Mansfield's Ice Cream Company should serve as an inspiration to every ice cream manufacturer who has a vision of a larger business and hopes to some day make his dreams come true. Quality and service will make them come true, just as they have for Mansfield.

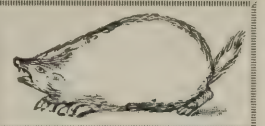
MICHIGAN CONVENTION.

The place and time of the Annual Convention and Dairy Show of the Michigan Allied Dairy Association will be Saginaw, February 14-17, both inclusive, according to action taken at the meeting of the Association's Convention and Show Committee which met in Lansing recently and consisting of Messrs. H. D. Wendt, chairman, M. L. Noon, R. F. Frary, C. J. W. Smith, R. J. Ellwanger, D. W. Shiel.

The convention and show, based upon plans which are now being developed by the Committee, will without question be the largest and most extensive of its kind ever produced in Michigan. There will be a complete line of commercial exhibits of dairy machinery, supplies and appliances of all kinds. Educational exhibits by the Michigan Agricultural College and the State Department of Agriculture will be featured. A dairy campaign in Saginaw to run for a week or more and ending with the convention and show is contemplated. In this, such agencies as the farm bureau, the schools, Saginaw Board of Trade, etc., will be co-operating, the purpose of which is to bring about a more complete appreciation of the value and essential features of milk and milk products.

The Saginaw Municipal Auditorium has been made available for the use of the Association by the Saginaw Board of Trade and is a building ideally suited for the purpose in question. The following sub-committees who will work with Mr. Wendt, who will be the Convention and Show manager, are as follows: Program—M. L. Noon, Jackson. Floor—C. J. W. Smith, Detroit. Finance—R. J. Ellwanger, Grand Rapids. Publicity—R. F. Frary, Lapeer. Reception and Banquet—D. W. Shiel, Hillsdale.

A Traffic Rule



"Why do you turn out for every road hog that comes along?" said the missus, rather crossly. "The right of way is ours, isn't it?"

"Oh, undoubtedly!" answered he, calmly. "As for our turning out, the reason is plainly suggested in this epitaph recently used:

"Here lies the body of William Jay.
Who died maintaining his right of way;
He was right, dead right, as he sped along,
But he's just as dead as if he'd been wrong."

BADGER FLYERS

Send communications to O. E. HARWOOD Secretary - Treasurer 300 W. Austin Ave. Chicago, Ill.

We were looking for a letter from J. G. Hammerschlag, who is the very capable district manager for the Westerlin & Campbell Co. who are the western representatives for the York Manufacturing Company, with some news from his part of the country and he says that because his diamond studded eversharp was in pawn was no reason why he couldn't write as he always managed to keep an ordinary lead pencil on hand, so he says he is glad to tell us that, as usual the York Manufacturing Company had a fine exhibit at the Dairy Show (as if we didn't know that they did have a peach) and the exhibit was in charge of the Westerlin & Campbell Company.

There was a running exhibit of machinery which was worth while seeing and the boys were given a hearty welcome, old and new friends, at their booth.

Mr. Hammerschlag says "In honor of Volstead and his native state the reception was, unfortunately, dry". We doubt it though, very much, for we never saw a very dry party pulled off by any of the Badger Flyers.

* * *

We heard that little poem about the:

"We'll build a little still,
On the side of the hill,
Anl let the rest of the world go dry."

but we never heard one like M. E. Thompson, a Badger Flyer, sent in:

"Ten thousand Jews,
Are selling booze,
Without the state's permission;
To supply the needs
Of a million Swedes
Who wanted prohibition."

and he signed it—"A Swede Himself."

What's bothering us is just how much of that percentage brother Thompson has bought for consuming purposes. It we ever bump into him at any of these coming conventions, we are going to rub mighty close to his hip and be a good friend of his'n. Anyway, you have to concede that James Whitcomb Riley has nothing on Thompson. The Creamery Package Company of Chicago, Ill., is the lucky company to have this poet of renoun on their force.

SODA MENUS

Ice Cream Manufacturers—Use Them to Advertise

OUR menus are popular among ice cream manufacturers who give them to druggists and confectioners with the manufacturer's trade-mark or advertising slogan printed on them. This is a sure and inexpensive means of advertising the ice cream manufacturer as the menus come to the attention of the customers of the retailer.

These menus are **especially** for the Soda Fountain. They are not hotel menus nor restaurant menus, but are printed and embossed in colors on the highest grade of stock and reproduced from original drawings for the use of Soda Fountains exclusively.

Samples Free on Request.

THE ALLIS PRESS Kansas City, Mo.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Greenville, Ala.—B. E. Bragg has opened a creamery and ice cream plant in the Greenville Ice Company building, located on Commerce street, and has commenced the manufacture of butter, ice cream and other dairy products.

Hamilton, Ont., Canada.—The Brant Creameries Co., will establish a dairy and ice cream plant.

Washington, D. C.—John Humphrey of Takoma Park; A. G. Bailey and Paul Sieman of Washington, D. C., have incorporated under the name of Takoma Park Ice and Ice Cream Co. The incorporation amount is $80,000.

Anamosa, Ia.—The Anamosa Farmers' Creamery has made 30,000 gallons of ice cream so far this season, as against 8,000 gallons for the entire season last year.

Waterloo, Ia.—The Producers Milk Co. sold their ice cream business to Jas. Cronin and B. F. Peck.

Geneva, Ill.—The Geneva Products Co., to manufacture ice cream, etc., capital stock $140,000. Incorporators: W. D. Banga, W. C. Sennet and L. S. Hardin.

Columbia City, Ind.—Mr. Geo. W. Myers has bought a half interest in the creamery owned by his father, Frank L. Myers. The creamery was established in 1892, and employs thirty men. They manufacture butter and ice cream.

Marion, Ind.—Montel Ice Cream Co., increased capital from $30,000 to $45,000.

Elkhart, Kans.—The Elkhart Ice and Ice Cream Plant is now under the management of J. Y. Bowers.

Ellis, Kans.—The Golden Belt Creamery and Ice Co., Ellis county, chartered with capital stock of $65,000. Ernest King, Grace King and Asa King, all of Ellis, Kans., purpose to manufacture, sell and ship ice, ice cream, butter and other dairy products.

Pratt, Kans.—Due to increasing business, the Kaufman Creamery and Ice Cream plant has been compelled to install new machinery, also to make further additions as to capacity of floor space.

Salina, Kans.—The Belle Springs Creamery Co., a branch of the Abilene, Kans., have recently begun the manufacture of ice cream.

Winfield, Kans.—The Winfield Dairy, where Velvet Ice Cream is made, is now the sole property of C. A. Radley, senior member of Radley& Blevins, owners of the plant heretofore. Mr. Bleving has sold out to Mr. Radley.

Hammond, La.—The Hammond Dairy Products Co. has begun the erection of a modern creamery and ice cream factory. The building will be of brick with large loading sheds on one side.

Shreveport, La.—The Northeastern Louisiana Milk and Cream Co. is being organized by West Carrol and Richland parish farmers and business men, and a few farmers of the northeastern part of Ouachita parish, for the purpose of organizing an extensive dairy, creamery and ice cream business in this part of the state.

Lawrence, Mass.—The Jersey Ice Cream Co. are planning to build an addition to their plant.

St. Paul, Minn.—The Curran Ice Cream Co., St. Paul, Minn.; capital stock $25,000. Incorporators: J. B. Curran, C. P. Curran, George W. Carlson and others.

Wakefield, Mass.—A small, modern ice cream plant has been built for A. B. Weld.

Charleston, Mo.—Preliminary steps have been taken to establish an ice plant, ice cream plant and creamery in this city.

Kansas City, Mo.—E. D. Frear, of Seattle, Wash., has invented a scale for measuring ice cream and will be associated with a company in Kansas City to put this on the market.

Charlestown, Mo.—Steps have been taken to establish an ice plant and an ice cream plant and creamery. The business men have signified their willingness to co-operate.

St. Louis, Mo.—The Liberty Cone Company and Union Ice Cream Company have consolidated, and hereafter will be known as Liberty Union Cone Company. The company has a capital stock of $20,000. Albert C. Davis is the attorney, 403 Title Guaranty Bldg., St. Louis, Mo.

West Plains, Mo.—E. D. Woodburn, formerly manager of the West Plains Creamery, has leased space in the Bond Block for an ice cream factory. Mr. Moore has also purchased the ice cream company formerly owned by S. T. Hardin and D. B. Moore, at Walnut Ridge, Arkansas.

Willow Springs, Mo.—The Willow Springs Creamery Co. will soon erect a modern creamery and ice plant, to cost $40,000. Included in the equipment will be a 20-ton ice making plant and ice cream making machinery.

Brantford, Ont., Canada.—The Brant Creameries, Ltd., will establish a dairy and ice cream plant.

Hastings, Nebr.—The present Hastings Ice Cream Co. is to have two plants as subsidiaries. W. C. Hunt of this company has purchased the McCook Ice Cream Co. and the Holdredge Bottling Works for this purpose.

Charlotte, N. C.—The Mecklenburg Dairy & Ice Cream Co. has applied for incorporation with $150,000 capital stock. Parties interested are: Robt. E. McDowell, Hazel Pharr, Chas. Stoew and J. E. McIlwaine.

Camden, N. J.—The Crescent Ice Cream Co., capital stock $125,000. Incorporators: E. G. Elzey, H. G. Elzey, and others.

Brooklyn, N. Y.—A confectionery and ice cream plant has been incorporated for $150,000 by Theo. Vagenas, E. Katsoros and A. Weiner.

Jamestown, N. Y.—Messrs. H. A. and F. Lindblom have opened up at 340 Forest Avenue under the name of the Chautauqua Ice Cream Company, and are manufacturing ice cream.

Saratoga Springs, N. Y.—The Kirk-Maher Co. of Malone, N. Y., manufacturers of ice cream, have leased the Hefferman building on Church St. nere and will open a plant directly.

Napoleon, O.—The Hockler Ice Cream Company will, according to intentions, build a new factory this fall.

Sandusky, O.—The Esmond Dairy Company announces the addition of a new hardening room which is to be thoroughly equipped.

Youngstown, O.—Additional refrigeration is soon to be installed in the Milliken & Evans Ice Cream Company.

Allentown, Pa.—A new branch plant for the M. & G. Ice Cream Co. of Tamaqua will be built at Allentown. The daily output is expected to reach 16,000 gallons.

Erie, Pa.—The Olympia Confectionery Co., at 1102 State St., will install refrigeration equipment this fall. Mr. Askorones is the manager.

Newberry, Pa.—Chris Fry will increase the capacity of his plant next season.

Pottstown, Pa.—Burdan Bros. have decided to build a model ice cream manufacturing plant.

Scranton, Pa.—A scranton service branch of the big M. & G. Ice and Ice Cream Company, Tamaqua, Pa., which is carrying on a tremendous business throughout the state, has been opened at 218 Pennsylvania Avenue.

Wilkes Barre, Pa.—F. Fadden & Sons, Inc., will build an ice cream plant here. The parties interested are from Scranton, Pennsylvania.

Providence, R. I.—A new story plant which is costing $60,000 is to be the future home of the Sunshine Ice Cream Co.

Memphis, Tenn.—The Dixie Ice Cream Co. of Memphis will erect a large plant. The plant will have a capacity of half a million gallons of ice cream annually.

Sherman, Tex.—Fire destroyed the plant of the Purity Ice Cream Co. The damage is estimated at $10,000.

Sweetwater, Texas.—The Sweetwater Ice Cream factory was destroyed by fire. It is not known what if any insurance was carried.

Shenandoah, Va.—Mr. J. F. Orye has intentions of building an ice cream plant this fall in Shenandoah.

Antigo, Wis.—The Antigo-Sheboygan Dairy Prod. Co., ice cream and butter manufacturers, incorporated capital 200 shares of preferred stock at $100 each, and 100 shares of common stock. M. G. Douna, F. H. Peacock and Alexander A. Kinewaldt are the incorporators.

Appalachia, Va.—The Appalachia Ice Cream Co., capital stock $50,000. Incorporators: E. R. Casper, H. H. McClanahan and S. A. McCluen.

Weston, W. Va.—During the latter part of August the Weston newspaper office was treated to a half gallon packer full of mighty fine ice cream, which was some of the first made by the Weston Dairy Company in their new, modern and sanitary plant at the head of main St. It is to be hoped that the Lewis county citizens will patronize the home boys, as they deserve their patronage.

Burlington, Vt.—The old plant of the Vermont Ice Cream Co. has been leased by the Coon Ice Cream Co. Enlargement and alteration of same will soon be in force.

Appleton, Wis.—Continued growth of the business of the Mory Ice Cream Co. has caused it to increase its capital from $75,000 to $100,000.

New Richmond, Wis.—The New Richmond Creamery Co. is installing ice cream equipment and will be ready soon.

Stevens Point, Wis.—The Sheboygan Dairy Products Company, Sheboygan, Wis., is branching out throughout the State of Wisconsin. The latest organization being at Stevens Point. They plan to add an ice cream department shortly.

FLAVOR YOUR ICE CREAM WITH

Cremilla

"CREMILLA" is better, smoother, creamier and of richer flavor than the finest grade of pure vanilla; and it's more economical.

"CREMILLA" is so concentrated as to make it the best flavor to use with homogenized cream; one-third to one-half oz. flavors perfectly 10 gallons of cream (one to one and a half pints for 500 gallons.)

Trial gallon by express on request. After fair trial, if you don't like it, send back what's left and pay us nothing.

National Fruit Flavor Co.
NEW ORLEANS, U. S. A.

AN ACT TO REQUIRE SANITARY CONDITIONS IN ICE CREAM PLANTS, CREAMERIES, AND CHEESE FACTORIES

The General Assembly of North Carolina do enact:

Section 1. That for the protection of the health of the people of the State, all places where ice-cream is made for sale, all creameries, butter and cheese factories, when in operation, shall be kept clean and in a sanitary condition. The floors, walls, and ceilings of all work rooms where the products of plants named herein are made, mixed, stored, or handled shall be such that same can be kept in a clean and sanitary condition. All windows, doors, and other openings shall be effectively screened during fly season. Suitable wash rooms shall be maintained, and if a toilet is attached, it shall be of sanitary construction and kept in a sanitary condition. No person shall be allowed to live or sleep in such factory unless rooms so occupied are separate and apart from the work of storage rooms. No horses, cows, or other animals shall be kept in such factories or close enough to contaminate products of same unless separated by impenetrable walls without doors, windows, or other openings.

Section 2. Suitable means or appliances shall be provided for the proper cleaning or sterilizing of freezers, vats, mixing cans or proper conveyors, and all utensils, tools, and implements used in making or handling cream, ice cream, butter or cheese, and all such apparatus shall be thoroughly cleaned as promptly after use as practical.

Section 3. All cream, ice cream, butter, cheese, or other products produced in places named herein shall be pure, wholesome, and not deleterious to health, and shall comply with the standards of purity, sanitation, and rules and regulations of the Board of Agriculture provided for in section eight of this act.

Section 4. Every person, company, or corporation who shall receive milk, cream, or ice cream which is delivered in cans, bottles, or other receptacles, shall thoroughly clean same as soon as practical after the contents are removed and before the said receptacles are returned to shipper or person from whom the same was received, or before such receptacles are delivered to any carrier to be returned to shipper.

Section 5. Creameries and factories that purchase milk and cream from producers of same on a butter-fat basis, and pay for same on their own test, shall make and pay on correct test, and any failure to do so shall constitute a violation of this act. The Board of Agriculture, under regulations provided for in section eight, shall have such test made of milk and cream sold to factories named herein that will show if dishonest tests and practices are used by purchasers of such products.

Section 6. It shall be the duty of the Department of Agriculture to enforce this act, and the Board of Agriculture shall cause to be made by the experts of the department such examination of plants and products named herein as are necessary to insure the compliance with the provisions of this act. For the purpose of inspection, the authorized experts of the department shall have authority, during business hours, to enter all plants or storage rooms where cream, ice cream, butter, or cheese or ingredients used in same are made, stored, or kept, and any person who shall hinder, prevent, or attempt to prevent any duly authorized expert of the department in the performance of his duty in connection with this act shall be guilty of a violation of the act.

Section 7. If it shall appear from the examinations that any provision of this act has been violated, the Commissioner of Agriculture shall have authority to order the plant or place of manufacture closed until the law is complied with. If the owner or operator of place refuses or fails to comply with the order, law, or regulations, the commissioner shall then certify the facts in the case to the solicitor in the district in which the violation was committed.

Section 8. The Board of Agriculture is hereby authorized to establish such standards of purity for products and sanitation for plants or places of manufacture named herein with such regulations, not in conflict with this act, as shall be necessary to make provisions of this act effective and insure the proper enforcement of same, and the violation of said standards of purity or regulations shall be deemed to be a violation of this act.

Section 9. For the purpose of defraying the expenses incurred in the enforcement of this act, the owner, proprietor, or operator of each ice cream factory or creamery in this State that disposes of its product at wholesale to retail dealers, to be resold, shall pay to the Commissioner of Agriculture during the month of July of each year an inspection fee of twenty dollars ($20), and each maker of ice cream who disposes of his product at retail only, and cheese factories, shall pay the Commissioner of Agriculture an inspection fee of five ($5) during the month of July of each year.

Section 10. That any person, firm, or corporation who shall violate any of the provisions of this act shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not to exceed twenty-five dollars for the first offense, and for each subsequent offense in the discretion of the court.

Section 11. All laws in conflict with this act are hereby repealed.

Section 12. The act shall be in force from and after May first, one thousand nine hundred and twenty-one.

Ratified this the 8th day of March, A. D. 1921.

We design your new plant to fit or make your present one fitter

A thorough knowledge of ice cream making, together with our wide experience in industrial plants, enables our staff of engineers to design a low cost high efficiency plant for you, or to increase production in your present one.

God's greatest mercy was to so shape our minds that as the time for death approaches we begin to think more of the past than of the future, and to have a greater love for the memory of the dead friends than we have for the presence of the living ones.

"NUISANCE" TAX WILL GO

The tax is to be taken from the ice cream cones of America's children, Republican members of the House ways and means committee have decided.

Of all the "nuisance taxes", this was the most obnoxious. Every one who patronizes places where soda water and ice cream are sold is acquainted with it. Internal revenue officers also are advised of its existence, particularly because they assert it is impossible of collection, as the returns cannot be checked up accurately without running up an expense account as great or greater than the amount realized from this source.

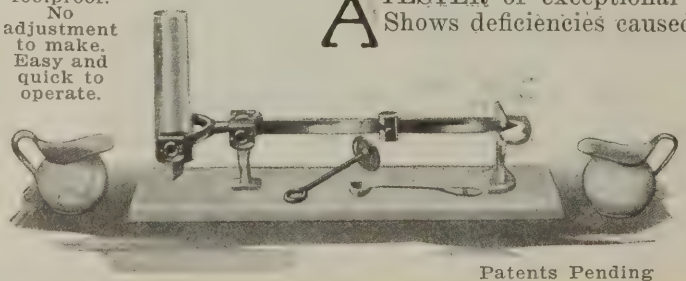
The yield has been about $25,000,000 per annum, but according to the authorities, users of fountain drinks have been charged several times that amount. In fact, it has been their experience that the tax has been chiefly important as an excuse for raising the price of ice cream and soda water, normally retailing at 5, 10 or 15 cents.

Elimination of the tax probably will witness a revision of prices for these commodities. In point of fact, dealers generally have not waited for Congress to act in the matter, but have absorbed the tax at the same time that they have slashed their quotations.

Where the "nuisance tax" has been continued, it has added another penny to the ice cream cone of childhood—a source whence the government cannot derive revenues with a feeling of complete satisfaction to itself or its agents.—Seattle (Wash.) Times.

UNITED CORK COMPANIES OPEN NEW OFFICE.

The United Cork Companies of New York, have opened a new office in St. Louis, Missouri, at 1420 N. Broadway. This office will be in charge of Mr. C. E. Schoenemann, who, for the past several years, has been connected with the Sales Office of Chicago. This is the ninth sales office established by this company, the others being at New York, Atlanta, Boston, Dallas, Cleveland, Chicago, Philadelphia and San Francisco.



ICE CREAM FACTORY OPENS FOR BUSINESS.

The Richmond Creamery Co., New Richmond, Wis., manufacturers of butter and ice cream, opened for business recently. This concern has completed the erection of a thoroughly modern plant, and has installed all of the latest machinery for the manufacture of ice cream and butter, which will be marketed locally and in adjoining towns.

Petersen Ice Cream Gain Indicator

Absolutely foolproof. No adjustment to make. Easy and quick to operate.

A TESTER of exceptional value as a means of checking freezer efficiency. Shows deficiencies caused by improper refrigeration or handling of mix.

THUNDER CAUSES CONCOCTION OF ICE CREAM SODA

Drink Inventor's Grandson Tells Story of Storm That Started "Fizz" Vogue

Detroit.—A summer thunder shower forty-one years ago resulted in the "invention" of the ice cream soda according to Fred Sanders, Jr., of Detroit, Mich., whose grandfather, Fred Sanders, claimed the distinction of having discovered this American institution.

Used Real Cream

Speaking of his grandfather's discovery Mr. Sanders said:

"Forty years ago the American people regarded ice cream much as the lily that could not be painted. At that time they 'took it straight'. Sirups were in general use in drink concoctions, but the ice cream sundae and its many near relatives were unknown. Carbonated water was used by the soda dispensers in a popular drink known as sweet cream soda. Its chief ingredient was sweet cream, direct from the farm.

Quenches Wedding Thirst

"The thunder-shower that brought about my grandfather's discovery came in the summer of 1880. He was conducting a soft drink parlor and the storm caused the sweet cream he had intended for sodas to sour. Just after the storm passed a wedding party dropped in and my grandfather volunteered to experiment until he found a substitute drink. He tried several drinks and finally concocted one almost identical with the ice cream soda of today.

"Members of the party liked the new drink so well that it became popular within a short time and soon all dealers were making the sodas."—Chicago Post.

DISCOVERING ICE CREAM

Sambo, the New York darky, may have claimed the discovery of ice cream, the Detroit man the discovery of the ice cream soda, but it must be conceded that Science has discovered the real food value of ice cream, according to the opinion of "Sweets", a confectioners publication.

"Science has discovered ice cream. That is, the learned gentlemen who spend so much time poking their noses into the texture of different things, have learned that ice cream is of great food value. We find this out in many of the popular national publications of the day.

"Only a short time ago considered a luxury, the product of the ice cream manufacturer now is being acclaimed as one of the most wholesome dishes in the household. For this recognition the manufacturer is due little credit, only insofar as quality production is concerned. It is easy to understand just how much more widespread would be the popularity of ice cream in the household if there were more aggressive salesmanship—that is, efforts to sell the industry itself.

"The bakers say, "Bread is your best food," and that industry is content to sell itself as an industry to the public. Let ice cream manufacturers stop saying that theirs is the best and tell the public that their industry produces something of value to health.

"The scientists were a long time about it, but they finally discovered ice cream. There's hope that the ice cream manufacturers will, too.

EIGHTEEN PER CENT OF FAT.

Must Hereafter Be Contained in Ice Cream Sold in Ohio.

All cream sold in Ohio must contain at least 18 per cent butterfat and be so labeled, according to regulations just issued by Director of Agriculture L. J. Taber and R. M. Black, chief of the bureau of dairy and foods.

The word "cream" or any combination or association of the word "cream" shall not be used as a name or part of a name of any imitation of, or substitute for cream, milk or skimmed milk mixture of less than 18 per cent butterfat in connection with the sale of such imitation or substitute.

The words "cream half and half," "split cream," "thin cream," etc., and like labels shall not be used, but words such as "special milk," "half and half," etc., may be used on caps or labels for coffee and cereal milk provided the name of the producer or vendor, the words "standardized or whole milk," as the case may be, and the butterfat content be plainly printed on the cap or label.

At the request of milk dealers, Director Taber has allowed them 60 days to use up their supply of caps, but the contents of the bottles must meet fully the provisions of the new law.

THEY ARE BECOMING NUMEROUS

The Electro Chemical Company
DAYTON, OHIO

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—Since last writing you we have decided to change our formula from evaporated milk to skim milk powder, using 6 lbs. sugar, 8 oz. gelatine, 4 oz. flavoring, 3 gal. of 4½ per cent milk, and 1 gal. of 40 per cent cream to the 50 lb. batch. We would like to know how many pounds of Merrell-Soule skim milk powder would bring our mix up to a first class standard ice cream.

Also please advise us as to the best way of ordering our cream, 20 per cent or 40 per cent. We still have trouble with the mix not coming up to the required amount and the cream forming butter on the paddle. Yours truly, J. B. McK. M. CO.

Reply: I have analyzed your ice cream mix, as you gave it in your letter. You will find the calculations given below in Table No. 1:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
6.00 lbs. sugar	....	.....	5.70
.75 lbs. gelatine & flavor	....	.....	.48
25.80 lbs. 4.5% milk	1.16	2.19	3.35
8.00 lbs. 40% cream	3.20	.42	3.62
40.55 lbs.	4.35	2.61	13.15
Per cent	10.70	.64	32.40

Per cent sugar, 14.79.

You stated that this mix was for a total of 50 lbs. I find, however, on adding it up that it only totals 40.5 lbs., and I am wondering whether you did not make a mistake in putting down the amounts of various ingredients.

You will notice that your mix figures 10 per cent butterfat and only 6.4 per cent serum solids, making a total of 17 per cent milk solids. Your total solids are high because this mix figures out nearly 15 per cent sugar. Without the sugar they are lower than I would want them for a good ice cream. You will have a much better balanced product if you will have, along with the 10 per cent butterfat, 10 per cent milk serum solids. You could get this by adding 4.5 to 5 lbs. skim milk powder. In that case, however, I would reduce the amount of sugar to about 12%.

You stated in your letter that you still had trouble in securing the overrun and that you also had trouble with the mix forming butter in the freezer. I suggest that you write to me again giving exact details showing all the ingredients of your mix; the temperature of pasteurization; the length of time and the temperature it is held at before freezing; the time necessary to freeze a batch in the freezer and the consistency at which you draw it from the freezer. With this information it is possible that I can locate your difficulty.

* * *

Dear Sir:—Following is our formula for a 600-pound ice cream mix, which I want you to pass on:

600 Lb. Mix.

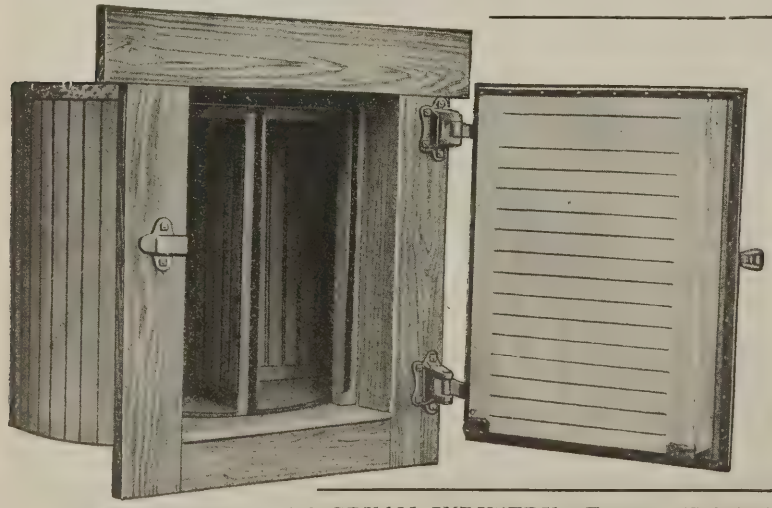
Ingredients	Fat	Serum Solids	Total Solids
78.00 lbs. sugar	....	.....	74.1
437.00 lbs. milk	17.48	37.33	54.81
27.00 lbs. milk solids	....	25.67	25.67
53.00 lbs. country butter, 80% B. F.	42.40	.....	42.40
3.75 lbs. gelatine	....	.....	3.75
.75 lb. Meloine	....	.....	.75
1.25 lbs. extract	....	.....	.....
.13 lb. coloring	....	.....	.....
600.88 lbs.	59.88	63.00	201.48
Per cent	9.98	10.5	33.58

I want a 13 per cent sugar, 10 per cent butterfat 10½ per cent serum solids, and did want 32½ total solids but have 1 per cent more than I wanted.

What do you think of the formula? What could be done to improve it? I have been thinking of using some India gum, say about two ounces, to each hundred pounds of mix, at the same time taking out the equivalent amount of gelatine. What is the best method of incorporating this gum in the mix? What would be the result of the change? We hoped to make a smoother cream by adding the gum.

Yours truly, D. I. C. CO.

Reply: The reason that you have 33.5 per cent total solids is because you are using 13 per cent sugar instead of 12 per cent, along with 20 per cent milk solids. I should say that you have a very good mix and there is no reason why you should not use 33.5 per cent solids.



Regarding the use of pure India gum, I might say that many ice cream manufacturers prefer the use of some gum to a large amount of gelatine. The best way to incorporate this gum into the mix is to mix the finely ground gum thoroughly with the sugar and then stir into the mix gradually. I have found no trouble in getting it incorporated into the mix when used in this manner.

* * *

Dear Sir:—Will you kindly analyze and criticise the following mix:

115 gallons 18% cream, 5 gallons 3½% milk, 40 gallons 8% whole condensed milk, 250 lbs. sugar, 8½ lbs. gelatine.

Will you please work out a formula on the hundred

pound basis, using the above ingredients? What is the solid content of 8 per cent condensed, three to one?

Yours very truly, C. E. H.

Reply: You will find the analysis below in Table Number 1:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
115 gal. or 966 lbs. 18% cream	173.88	70.49	244.37
5 gal. or 43 lbs. 3.5% milk	1.50	3.69	5.19
40 gal. or 360 lbs. 8% condensed milk	28.80	79.20	108.00
250 lbs. sugar	....	.....	237.50
8.5 lbs. gelatine	....	.....	8.07
1627.5 lbs.	204.18	153.38	603.13
Per cents	12.5	9.4	37.0

Per cent sugar, 15.3.

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
15 lbs. sugar	....	.....	14.25
1 lb. filler and flavor	....	.....	.60
22 lbs. 8% condensed	1.76	4.84	6.60
6 lbs. 3½% milk	.21	.36	.57
56 lbs. 18% cream	10.08	4.10	14.18
100 lb. mix	12.05	9.30	36.20

Kindly note that your product is extremely high in total solids, although the amount of milk solids is only about 22%. Your formula is not well balanced because of the large amount of sugar. You may have some reason for using such a large percent of sugar, but our trade in our section of the country does not use only about 12 or 13 per cent. I am suggesting in Table No. 2 a mix using the same ingredients calculated on a 100-pound basis. I have figured the 8% condensed milk, 30% total solids and 22% serum solids. This is a concentration of 2.5 to 1. The ordinary 8% evaporated milk does not run quite as high in solids, being about 26% total solids. You did not state in your letter what form of condensed milk you used.

* * *

Dear Sir:—In reading The Ice Cream Review I have taken much interest in your inquiry department. Last year I started in the ice cream business. I am using a Fort Atkinson freezer, connected to the brine tank. I have just completed the installation of a De Laval pasteurizer and mixer. The mix that I am using I arrived at by experimenting. I would like to have you analyze it for me and figure it on a one hundred pound basis, or suggest some other suitable mix. The mix I am using at present is 6 lbs. sugar, 3¼ gals. 22% cream, 2½ gals. milk powder, 4 ounces gelatine.

Milk powder is mixed 3 lbs. to the gallon of water.

Gelatine 4 ounces to 1 quart of water.

This mix gives 10 to 11 gallons of finished ice cream.

Very truly yours, E. R.

Reply: I have made calculations of your formula as requested and you will find it below in Table No. 1:

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
6 lbs. sugar	...	....	5.7
2.5 lbs. gelatine and water	...	....	.24
27.3 lbs. 22 per cent cream	6.0	1.89	7.89
21.5 lbs. powder and water	...	5.70	5.70
57.3	6.0	7.59	19.53
Percents	10.48	13.2	34.0

Table No. 2

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	...	....	11.40
.5 lbs. gelatine (8 oz.)	...	....	.50
45.5 lbs. 22 percent cream	10.01	3.12	13.13
8.4 lbs. skimmilk powder	...	7.97	7.97
33.6 lbs. water	...	....	....
100.0 lbs. mix	10.01	11.09	33.00

The above table is for a 100-lb. mix—12 per cent sugar—10 per cent fat—33 per cent total solids.

You will notice that your cream tested about 10% butterfat and 34% total solids. I am suggesting in Table No. 2 a mix similar to the one which you now have calculated on the 100-pound basis, except that I have reduced the total solids to 33%, which is sufficiently high for a satisfactory ice cream testing 10% fat.

* * *

Dear Sir:—Thank you very much for your help. The graininess in our ice cream was as you suggested due to the low temperature at which it was stored, as, we have had no trouble since. Would like to have you check up the following mix for us:

69.00 lbs. 18.5 per cent cream.
15.00 lbs. condensed (unsweetened).
14.00 lbs. sugar.
.75 lbs. gelatine.
.50 lbs. vanilla.

I figure this mix to contain 14.1 per cent fat and 36.8 per cent total solids. After subtracting the fat from the cream I figure 9.2 per cent serum solids, condensed 7.7 per cent fat and 28 per cent total solids, sugar 95 per cent total solids, gelatine 86.4 per cent and no solids in the vanilla. Believe I am a little high on serum solids and low on gelatine.

Do you think this mix contains about the right amount of solids for a one hundred per cent overrun?

Respectfully, D. H. B.

Reply: I am glad to know that you have succeeded in eliminating the graininess in your ice cream. You will find an analysis of your mix given below in Table No. 1:

The new way—a child's play

B. H. BUNN & CO. 7329-31 Vincennes Ave. CHICAGO, ILL.

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
69.75 lbs. 18.5 p. c. cream	12.9	5.06	17.96
15.00 lbs. condensed	1.15	2.70	3.85
14.00 lbs. sugar	...	....	13.30
.75 lbs. gelatine	...	....	.75
.50 lbs. vanilla	...	....	....
100.0 mix	14.05	7.76	35.86

You have possibly figured your total solids a little high. The per cent of total solids which you have used is higher than the average in analysis. I am using the figure 8.9 per cent for the percent of solids in the serum. You have also figured your condensed milk 28 per cent total solids. As I understand it, this condensed is the ordinary evaporated milk which usually does not have over 26 per cent total solids. I do not know why you figure your gelatine 86.4 per cent as gelatine would run at least 95 per cent solids. Your mix easily contains sufficient solids to secure an overrun of about 100 per cent.

* * *

Dear Sir:—In your Inquiry Department in The Ice Cream Review, it does not state where those inquiries should be addressed, to you direct, or through The Review, and we are taking the liberty of writing you personally, as we are somewhat in a hurry.

We are using the following 100-pound mix: 12 lbs. sugar, 10 gals. 8% evaporated milk, 9 lbs. butter, 4 lbs. skim milk powder, 65.1 gals. 4% milk, 1¼ oz. vegetable gum, 3 oz. meloine.

From this we should get twenty gallons of ice cream but the best we can get is sixteen gallons. We use a tub freezer and have tried running fast and slow. We have a viscolizer and run the batch from the pasteurizer to the viscolizer. Some claim it is impossible to get a 100 per cent swell with a tub freezer, and if such be true, we want to install a brine freezer at once.

Do you think it would help us in getting our 100 per cent swell by putting in a brine freezer? We have also tried aging our mix twelve hours. So far, anything we have tried has not given us the 100 per cent swell. Yours very truly, N. M. I & P. CO.

Reply: I have your recent letter and have made an analysis of your ice cream mix, which is given below in Table No. 1:

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	...	....	11.40
10.0 lbs. 8 p. c. evaporated	.80	1.8	2.60
9.0 lbs. butter	7.56	....	7.56
4.0 lbs. skim milk powder	...	3.80	3.80
65.1 lbs. 4 p. c. milk	...	....	.36
.4 lbs. filler and flavor	...	....	....
100.5 lbs. mix	10.96	11.04	33.76

You can easily see that you have plenty of milk solids and total solids in your mix to get at least 100 per cent overrun.

You stated that you were doing your freezing in a salt and ice tub freezer. This freezer is undoubtedly losing you 25 per cent overrun. I suggest that you lose no time in securing a horizontal brine freezer, which I am sure will give you satisfactory results.

There is one matter in connection with the handling of your mix, however, which is not correct. You are not aging your mix longer than 12 hours. Most ice cream factories will try to age the mix at least 24 hours and preferably 48 hours before freezing.

* * *

Dear Sir:—Please give me information on pasteurizing mix before running it through viscolizer.

Please work out a formula for me with the following ingredients: cream, condensed 8%, sugar, gelatine, flavor. I want it to run about 12% on fat and 32 or 33% in total solids; also wish to say we will be using a viscolizer and expect to run the entire mix through the machine. Yours truly, C. F. S.

Reply: The usual method of handling ice cream mixes before passing through the viscolizer is to pasteurize the entire batch at 145 degrees and hold it for at least 20 minutes.

I am suggesting below, in Table No. 1, a 100-lb. mix made from the ingredients which you gave in your letter:

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
12 lbs. sugar	...	....	11.40
1 lb. gelatine and vanilla	...	....	.75
87 lbs. cream milk cond.	12.0	8.85	20.85
100.0 lbs. mix	12.0	8.85	33.00

You will notice that the 87 lbs. of cream, milk, and condensed is to furnish the butterfat and serum solids necessary to bring the total to 33 per cent. I presume that you will be able to calculate the amount of cream, condensed, and milk used to make it 87 lbs.

You did not state what your cream or milk was to test for butterfat consequently I could not give you the exact amounts of each to use. If you are unable to make this calculation I shall be glad to assist you further if you will give me the tests of your cream and milk. Please state also whether the 8 per cent condensed which you refer to is the regular evaporated milk or some other form of condensed milk.

* * *

Dear Sir:—Can you tell us what is wrong with our Strawberry Ice Ceam? We are unable at times to get it hard after being packed for twenty-four hours, and

KEYSTONE FRUIT PRODUCTS CO., "Dept. IC-2" Cincinnati, Ohio

it softens very easily in the cabinets among the trade. Our mix is as follows: Seven quarts of 40% cream, four quarts of condensed milk, twelve quarts of milk, four ounces of gelatine, two ounces of strawberry flavor and two quarts of strawberry stock, with a mixture of pulp and crushed berries.

Very truly yours, T. P. M. E., Inc.

Reply: I have analyzed your ice cream mix and have assumed that you have used about seven pounds of sugar with this mix, as you do not state the amount. In Table No. 1 below you will find the calculations and the per cent of butterfat, serum solids and total solids:

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
7 qts. or 14.0 lbs. 40 p. c. cream	5.60	.72	6.32
4 qts. or 9.0 lbs. 7.5 p. c. condensed	.67	1.60	2.27
12 qts. or 25.8 lbs. 4 p. c. milk	1.03	2.20	3.23
6 oz. or .4 lbs. gelatine and flavor	...	....	.38
7.0 lbs. sugar	...	....	6.7
57.2 lbs. mix	7.30	4.52	18.9
Per Cent	12.8	8.0	33.0

If you use two quarts of fruit with this mixture the butterfat content will be reduced to about 11.5 per cent. Your mix if made according to what you state in your letter contains plenty of solids so that you should have a fairly smooth cream which should harden easily and stay hard. If you continue to have trouble I suggest that you use a little more gelatine or a little gum in addition to the gelatine you are now using.

* * *

Dear Sir:—We wish that you would give us some information on the following mix as to butterfat, solids (both serum and total):

Ten gallons sweetened skimmed condensed (Libby's) supposed to contain 42 per cent sugar;; 5 pounds granulated sugar with five ozs. Melionee added; 10 gallons 35 per cent sweet cream; 24 gallons 5 per cent whole milk; 1 gallon gelatine mixture (three pounds cooked in water).

This is the way our mix comes to freezer. At freezer we use two oz. vanilla for vanilla cream, three quarts chocolate syrup for chocolate cream, and for all fruit cream one-half gallon of fruit, and one ounce of true fruit extract, together with color.

We want to get out a well balanced mix and one that will give as smooth a cream as possible. Our state law here is 8 per cent for all creams. Our business is not large enough to make separate mix for vanilla and fruit creams so we would want a mix that would test 8 per cent after fruits, etc., are added.

We are getting about 90 gallons of ice cream from this mix. Are making about half of it into fruit creams, the 45 gallons of mix with the 2½ gallons of fruit added at freezer giving us 47½ gallons of mix to 90 gallons of ice cream. Is this O. K.?

Thanking you for any information.

Yours very truly, M. I. C. CO.

Reply: Replying to your letter of recent date, forwarded from The Ice Cream Review, I am glad to make the analysis of your mix as requested, and you will find the calculations for butterfat and total solids given below in table No. 1:

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
10 gal.—110.0 lbs. cond...	...	29.7	75.80
5.3 lbs. sugar and Mel...	...	....	4.75
1.0 lbs. gelatine solution..	...	....	.30
10 gal. 82.0 lbs. 35 p. c. cream	28.7	4.72	33.42
24 gal.—206.4 lbs. 5 p. c. milk	10.3	17.45	27.75
404.7 lbs. mix	39.0	51.84	142.02
Per Cent	9.6	12.8	35.1

You will notice that the butterfat test of your vanilla mix figures out 9.6 per cent and your total solids 35 per cent. Your overrun on this mix was from 95 to 100 per cent, which is about right. This gives you a weight of 4.5 lbs. to a gallon of ice cream, or about 22 lbs. to a five gallon can. The amount of butterfat would not have to be quite as high in order to make your fruit ice cream. Mixing one-half gallon of fruit with five gallons of mix for ten gallons of ice cream would reduce the butterfat from 9.6 to 8.7 per cent. If you reduce the butterfat so that your vanilla mix tests 8.8 per cent your fruit ice cream would test exactly 8 per cent. 35.7 lbs. butterfat instead of 39 lbs. of fat which you are now using would make a mix which would still comply with your 8 per cent butterfat law.

* * *

Dear Sir:—We are having considerable trouble with our overrun at present and we don't really know where to lay our fault. We are freezing with zero brine and it takes about eighteen to twenty minutes in freezing. We want a 100 per cent overrun. We use Cherry freezers. As to our mix, we are using 1½ lbs. of grucose to 100 lb. mix, 8 oz.. gelatine, 2 oz. gum, 4 oz. vanilla, 67 lbs. of milk, average test about 3.2 per

cent, and we figure 10 per cent fat to 100 lbs. mix using sweet cream butter; balance skim milk powder and water to raise our total solids to 32.5.

In using Meloine we had honey comb cream in center of can so we have started using gum instead, but don't get a thick or heavy mix as we did with Meloine. With gum our cream seems to look watery in appearance.

We hold mix at 50 degrees F.. for 30 minutes to let gum thicken mix. Cold storage room is 10 below every evening; morning it is zero temperature. We We are using a York machine.

Will gum loose its efficiency standing, say six or eight months, when exposed to the air?

Meloine caused a shrinkage and honey comb cream.

Yours truly, I. S. O.

Reply: I do not know whether I am able to diagnose your difficulty from the explanation given in your letter, but it appears to me that if your mix is properly standardized to 10 per cent fat and 10.5 per cent serum solids and aged for at least 24 hours at below 50 degrees you should get a satisfactory overrun.

You stated that you were freezing at zero brine and it required 18 to 20 minutes for a batch. We have had no trouble in securing a satisfactory overrun, freezing a batch in 10 to 12 minutes. I suggest that you try experimenting with the amount of mix you have in your freezer, as it is possible you are overloading it. Probably a smaller amount of mix in your freezer would secure a better overrun if you reduced the time of freezing to 10 minutes.

* * *

Dear Sir:—Last November we wrote The Ice Cream Review in regard to some formulas and you answered us, giving us the formulas. We thank you very much for your kindness in this matter and are ashamed of ourselves for not having thanked you sooner.

We are not satisfied with the way we are making our ice cream mix and want to get it figured down to a more scientific basis and as we understand it all formulas should be worked on the 100 pound basis. The following list of the ingredients we are now using in what is approximately a 100 gallon mix or in other words, makes about nineteen (19) batches of 5½ gallons to the batch:

70 gallons of water.
65 lbs. 10 oz. skim milk powder.
10 lbs. 8 oz. sweetened condensed milk.
42 lbs. granulated sugar.
6 lbs. 4 oz. gelatine.
68 lbs. 14 oz. sweet butter.
24 drams Danish cheese color.

Now, what we want is for you to analyze this mix for us carefully advising the percent fats, serum solids and total solids also advising us what changes you would make in this formula to make a good commercial ice cream. We are in a very bad situation here on account of keen competition at a cheap price. We cannot get over $1.10 per gallon wholesale for our cream and to meet competition must have a good cream. We want something that will stand up and that has a good body. Butterfat does not count much in this territory. We cannot get any sweet cream at all and just a very small amount of whole milk so have to rely altogether on homogenized goods. If you do not like this formula, tear it to pieces and give us one that will be all right and will be as cheap or cheaper than this one. Please advise us how to figure this same batch we are now using on the 100 pound basis, instead of the gallon basis. Then advise how many pounds to use to the batch and what our finished cream should weigh and how much cream we should get from a batch. We are now using 5½ gallons of our present mix and getting out 11 gallons on an average. D. A. H.

Reply: I have analyzed for you below, in Table No. 1, the 100 gallon mix which you stated in your letter you were using:

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
42.0 lbs. sugar	...	....	39.90
6.25 lbs. gelatine	...	....	5.94
68.90 lbs. butter	57.87	....	57.87
65.60 lbs. powder	...	62.32	62.32
10.5 lbs. sweet condensed	...	2.83	7.03
583.8 lbs. water	...	....	....
777.0 lbs. mix	57.87	65.15	173.06
Per Cent	7.32	8.3	22.3

Table No. 2

800 lbs. Mix—8 percent Fat.

Ingredients	Fat	Serum Solids	Total Solids
56.0 lbs. sugar	...	....	53.24
8.0 lbs. gelatine, vanilla and color	...	....	7.00
76.2 lbs. 84 percent butter	64.00	....	64.00
100.0 lbs. sweet condensed	...	27.00	67.00
72.0 lbs. skim powder	...	69.00	69.00
487. 8 lbs. water	...	....	....
800.0 lbs. mix	64.00	96.00	260.24
Per Cent	8.00	12.00	32.53

You will notice that I have figured the total weight of your mix 777 lbs. You will also notice that the percentage of fat figured out 7.32 and total solids only 22.4 per cent. I am suggesting for you in table No. 2

Vanite

a mix using the same ingredients which you have been using worked over on the 100-pound basis. I have suggested an 800-pound mix as that is about what you have been accustomed to using. You will notice, however, that I have increased the serum solids and total solids considerably, as that is very necessary in order to assure ice cream of good body and texture. The trouble with your ice cream has been that you had too little solids compared with the overrun.

I believe it is possible for you to make ice cream from the formula suggested in table No. 2 and sell it at $1.10. Our Oklahoma and Kansas factories are using a similar formula, using 10 per cent butterfat instead of 8 per cent which slightly increases the cost of ingredients, and are selling the ice cream for $1 per gallon.

* * *

Dear Sir:—Will you kindly make up a formula using swet, pasteurized cream, sugar, pure vanilla and gelatine? We want to know whether or not we will have to use a filler so our ice cream will weigh four and three-quarters pounds per gallon?

Very truly yours, R. H. W. & CO.

Reply: I am suggesting below, in table No. 1, how to make up a 100-pound mix for 10 per cent butterfat and 10 per cent serum solids.

Table No. 1

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	...	....	11.40
1.0 lbs. gelatine and flavor ...		....	.75
83.3 lbs. 12 percent cream..	10.0	6.51	16.51
3.7 lbs. skimmilk powder.. ...		3.51	3.51
100.0 lbs. mix	10.0	10.02	32.17

Overrun—85 percent cream will weigh.

You stated in your letter that you desired to use sweet pasteurized cream, sugar, vanilla and gelatine. It would be impossible to make up an ice cream of 20 per cent milk solids without the use of either skimmed milk powder or condensed milk. With the formula suggested in table 1 it is possible to get ice cream weighing 4.75 pounds to the gallon, providing the overrun is not over 85 per cent.

* * *

Dear Sir:—Will you kindly give me an ice cream mix to make a ten per cent. finished cream, using emulsified sweet butter cream condensed skim-milk powerd, condensed milk, and a small per cent of whole milk, that is as small amount as you think advisable in order to get a good tasting cream.

Second simply substitute liquid skim-milk for the condensed skim-milk powder, and give me the mixes to make 100 gallons of finished ice cream.

Also would like to have two mixes, using in one mix condensed milk, 8 per cent, to bring up the solids to about 30 per cent, and in the other condensed skim milk powder, both to make a ten per cent finished cream.

Yours very truly, A. M. H.

Reply: I find, that on reading your letter that I would not be able to calculate these mixes for you without additional information. For instance, you state that in one mix you desire to use emulsified sweet butter cream. I am not able to tell whether this cream is made by emulsifing the butter in whole milk, in skim-milk, or in skim-milk powder and water. If made with skim-milk powder and water I must know the proportions of skim-milk powder and water used.

You also stated that you wanted to use condensed milk but you did not specify if this was to be condensed skim, sweetened condensed skim-milk, or the

regular 8% evaporated milk. You also did not state how much sugar you desire to use—whether 12%, 14%, or 16%.

You stated in your last paragraph that you wished to bring up the solids to 30%. A mix containing 10% fat and 12% sugar with only 30% total solids would not, in my opinion, make a satisfactory ice cream.

If you will furnish more detailed information, I will be glad to answer your questions. (See inquiry below.)

* * *

Dear Sir:—I want to know how to make nut ice creams, especially how to prepare different kinds of nuts, proportions, etc. We have an upright Progress freezer. Can you tell me where I can get these nuts?

Very truly yours, W. H. H.

Reply: I have your letter of recent date addressed to the Ice Cream Review which was referred to me. You should have no difficulty in making nut ice cream. The usual practice is to use the ordinary vanilla ice cream, color and flavor it for any combination and then use the crushed nuts which may be purchased from practically any creamery supply house which furnish crushed fruits and flavors. These nuts can be purchased in ground form, suitable for immediate use or the nuts can be purchased and ground up by the factory.

I do not know of any special formula or detailed directions for making nut cream except that found in a few of the ice cream books. Any ice cream maker can use his own judgment in blending flavors or different kinds of ice cream and also use the various crushed fruits and nuts.

* * *

Dear Sir:—Would be glad if you would give us process of making tests of ice cream for per cent of butter fat. Yours truly, L. I. C. Co.

Reply: We have made butter fat tests very satisfactorily by using the sulphuric glacial acetic test, a modification of the Babcock test.

The method simply consists of setting nine grams of well mixed ice cream or better ice cream mix, into either a 10% milk test bottle or a regular cream test bottle. Then add 10 cc. of pure glacial acetic acid. Mix this thoroughly with the cream in the test bottle and then add 10 cc. of the ordinary commercial sulphuric acid. After again mixing thoroughly continue in the regular way for making the Babcock test.

If this test is carefully made it should be accurate to within a very small per cent of error.

We will again have our one weeks short course for ice cream makers this winter during the week beginning December 26th and I suggest that you make plans to come to this course where all the various tests are taken up with the ice cream makers.

* * *

Dear Sir:—I figure the milk solids and sugar in 10 gallons of sweet condensed skim (3 to 1—40% sugar) to be: Total weight, 110 pounds consisting of 44 pounds sugar—milk solids 17.82 pounds—If this is not the correct way to figure this milk and if my figures are incorrect, kindly explain to me the right way and the correct figures. Yours truly, G. I. C. F.

Reply: A ten gallon can or 110 pound containing 40% sugar would furnish 44 pounds of sugar. This same 110 pounds containing 27% milk solids would furnish 29-7 pounds of milk solids. I do not know where you got your figure 17.82 pounds for milk solids but unless this sweet condensed milk is considerably different from all I have analyzed your figure is quite wrong. The total solids content of sweetened condensed milk is from 66% to 70%.

Dear Sir:—In formula one, I wish to emulsify sweet butter into 4% whole milk. I would like to have the amount figured to make 50 gallons of finished cream, testing 10% finished, and with the correct proportion of solids, which in your estimation would make a good balanced ice cream. To increase the solids in this mix, we are figuring on using Armours 8% evaporated unsweetened milk.

In formula two I desire to emulsify sweet butter in skim milk powder and water, now I would like for you to give me a mix for 50 gallons finished cream for formula two using skim milk powder or Armour's 8% evaporated milk to bring up the solids.

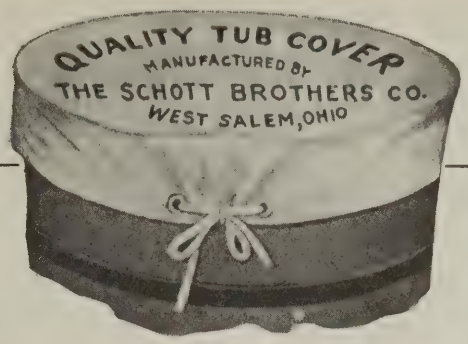
Our trade demands a sweet article of ice cream. We have in the past used 35 pounds granulated cane sugar for each mix of 225 pounds or 50 gallons finished ice cream. I would like for you to figure at or near this amount of sugar on these mixes.

Would it be advisable to emulsify 3 gallons of 30% pure fresh sweet cream, as part of the cream and the balance of sweet butter, and can you give me some advice as to how to proceed, that is, what should go in the mixer first, whole milk or water in the case you are emulsifying sweet butter in whole milk or skim milk powder and water. We want to use gelatine and to run through the emulsor, is it necessary to beat the gelatine before adding to the mix before pasteurization, we have used gelatine before, heating it to about 170 degrees, then cool down and add to the cold mix.

Very truly yours, A. M. H.

Reply: I have your further data regarding the ice cream mixes which you desired me to suggest to you. I am glad to suggest the two mixes requested in tables 1 and 2 below. You will notice that table 1 was made to contain a little better than 32.5% total solids and table 2 to contain 33%.

Table No. 1.



Ingredients	Fat	Serum Sol.	Total Solids
14.0 lb. Sugar			13.30
1.0 lb. Gelatine & Flavor (12 oz. gel., 4 oz. vanilla)			.75
20.0 lb. 8% Evaporated .	1.6	3.6	5.20
7.4 lb. Butter 84%	6.2		6.20
57.6 lb. Milk 4%	2.3	4.92	7.20
100.0 pound Mix	10.1	8.52	32.65

(100 lb. Mix—10% fat—20 gallons ice cream—using sweet butter, 4% milk and 8% evaporated milk.)

Table No. 2.

Ingredients	Fat	Serum Sol.	Total Solids
14.0 lb. Sugar			13.30
1.0 lb. Filler and Flavor			.75
12.0 lb. Butter	10.08		10.08
9.3 lb. Skim Milk Powder		8.87	8.87
63.7 lb. Water			
100.0 pound Mix	10.08	8.87	33.00

Either of the two formulas will make a satisfactory ice cream providing the materials used are first class and the mix is handled in the proper manner. If it is possible for you to secure some fresh sweet cream it would be advisable to use part sweet cream for the butter fat in your mix. In making up either of these batches it is desirable to put the whole wilk, skimmilk , or skim milk powder and water into the mixer first, then cut the butter in small chunks and then heat to the pasteurizing temperature. However, in getting the skim milk powder into solution in water it is best to have the water warm or at a temperature of about 110 degrees. It is not necessary to heat the gelatine in water as the gelatine can be added by mixing the granulated gelatine with the sugar thoroughly and introducing both into the mix at the time of pasteurization. We have done this for a number of years and find we get just as good, if not better results from our gelatine.

The
Time Tested
Tub Cover of
Quality

There is no better test for the qualities of a product than time.

During its course a product like the **Quality Tub Cover** goes through a series of experiences and hard knocks that proves the weak spots in make-up, serviceability and cost.

The fact that after six years as users, original buyers of **Quality Tub Covers** send in repeat orders each season for new tub covers, should be proof enough for you to investigate the quality, price and serviceability of Quality Tub Covers.

The Quality Tub Cover comes to you complete with staples, tie strings and your advertisement

AN INTERESTING ADVERTISING CAMPAIGN.

We are taking the liberty of publishing a business letter which gives the details of an advertising campaign put on by the John Wood Manufacturing Company, Conshohocken, Penna., better than we could put it in words. We wish that we might reproduce the circulars referred to in the following letter, but space will not permit:

Conshohocken, Penna., Sept. 19, 1921.

Editor Ice Cream Review:

It may interest you to know that we have been conducting an extensive advertising campaign on Electric Weld Rivetless, Solderless Ice Cream Cans, not only using some advertising space in trade journals but backing this up with direct-by-mail campaign.

Circulars printed on 120-pound coated stock paper and printed in two colors are being mailed to more than 5,000 ice cream manufacturers on an average of one a week, leading up to the big National Conventions; The National Dairy Show, the Eastern Exhibition of Ice Cream Supply Men and the Southern Exhibition at Atlanta, Ga., as well as the various state conventions. In this series the folders were arranged as follows:

1. "Do You Retin Your Old Cans?"
2. "Bottom Formation."
3. "Testing the Weld."
4. "The Non-Slip Grip Beaded Rim."
5. "The Non-Deforming Edge Lid."
6. "The Inspector's Approval Stamp."
7. "The Solderless Can."
8. "Repeat Orders."
9. "The Plant Behind the Solderless Can."

The feature of this direct-by-mail series is that each circular tells its own story bringing out the various important points of our product in an orderly manner. The little story on retinning cans, of course will interest any ice cream manufacturer, and in this circular we have endeavored to interest him to the extent of calling his attention on page two to the fact that another letter will follow on the Electric Weld Bottom Formation, which we state would be mailed in about two weeks from to-day, and suggest to him that he do not miss it.

The first circular was sent out as an enclosure in a personal letter to the manufacturer which contained about two or three short snappy sentences, and circulars, 2, 3, 4, 5 and 6 were prepared in such a way that a one-cent stamp pre-canceled by postoffice permit is used as a clip to fasten one edge. Each circular contains a notice to the postmaster that returned postage is guaranteed which enables us to keep our mailing list right up to date, and in addition each circular on the addressed page calls attention to the next message to follow.

The Conshohocken Recorder turned out this work, and, while not a large printing plant, took personal pride in the appearance of the job and was progressive enough to prepare for this kind of work by buying additional equipment to handle a job of this kind satisfactorily.

Another feature is that circular No. 7 was mailed at such a time that it reached the ice cream manufacturers as an enclosure in a letted just before they left for the National Exhibition in St. Paul, while 8 and 9 were followups; one "Repeat Orders", and the other "The Plant Behind the Can" intended to move any doubt as to the proven success of our product and the organization in back of it.

This rather elaborate sales campaign on our part at a time when so many firms were retrenching proved highly successful, and the results have already been gratifying.

This advertising campaign, together with the concerted efforts of our branch managers in various sections of the country had stirred up great interest in our new type containers and is bringing us a splendid return,

We thought, perhaps, you might be interested in this advertising program.

Very truly yours,

JOHN WOOD MFG. CO.

ASSOCIATION OF ICE CRAEM MANUFACTURERS OF PENNSYLVANIA

To All Members: There will gather in Erie, Pa. on October 31st and November 1st, 1921, for the purpose of exchanging ideas, a Bunch of good fellows who's heart and soul are in their industry—Ice Cream.

Are You Going to be One Of That Bunch?

The idea of having a set program, with the usual prepared papers on various topics, will be eliminated this year. Open discussions will be the order.

Bring along a list of subjects you would like information upon and see if there is not some one present who can and is willing to interchange ideas with you.

This will be your convention and it will be just as good as you help to make it.

"He Profits Most Who Serves the Best."

Do not come with the idea that you are going on a joy party, because the Erie boys are going to see that you have a good time, but come with the idea that you are going to get help and give help and that you will do all you can to help make this 15th Annual Convention at Erie the Best Ever.

Frank Biers of the Erie County Milk Association says that the calls for hotel reservations are coming in fine, so get in line and write Frank to make your reservation.

The Lawrence Hotel will be our headquarters. October 31st and November 1st are the days and last but not least the evening train to Buffalo, where the Association of Ice Cream Supply Men will hold their eastern exhibit from October 31st to November 5th inclusive.

We welcome any one interested in the ice cream industry to meet with us.

J. W. NEUMAN, Secretary,

ROBERT CRANE, President.

MANUFACTURE ICE CREAM FOR RETAIL TRADE

Plans to manufacture ice cream for the retail trade in St. Paul and Minneapolis in a factory owned and operated by the retailers were made recently at a meeting of organizers of the Northwestern Ice Cream company of Minnapolis, which filed articles of incorporation with the secretary of state.

A large factory with a capacity to supply not less than 500 retail stores will be erected at once. J. H. Marshall, president, indicated after the meeting.

"This company will be strictly co-operative," Mr. Marshall explained.

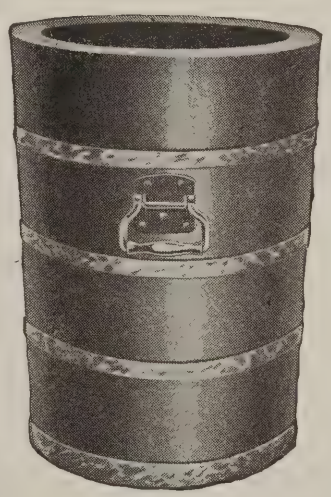
An Unusual Service

Quality: Every one to whom we have shipped re-tinned and re-built cans, etc., come back with more business, stating we do exactly the kind of work they have always wanted.

Promptness: Customers tell us we make prompter shipments than any other concern—quick delivery is a special feature with us,

Dependability: You will experience, when having "MANITOWOC" on the job, a dependable re-tinning and re-building service that covers every detail, assuring you absolute satisfaction.

Satisfaction Guaranteed



Our guarantee to you is backed by the most modern re-tinning and re-building plant in the country—by the most expert workmen—careful selection of material and rigid inspection and by an organization of high standing with the Dairy Industry.

"Quality First and Always" Is Our Motto

THE ICE CREAM REVIEW CORRESPONDENCE SCHOOL

Why not a correspondence school in the columns of the Ice Cream Review? Perhaps that isn't the name for it, but the name is not important. In the September issue we published the following letter:

Gentlemen: Having tried for some time to get some information without success, we are writing direct to you in the hope that you can refer this letter to some firm, capable of answering it correctly. While the writer is not exactly a novice in the ice cream business, having a couple of college degrees and several years' experience in different plants, so far we have been unable to successfully cope with this situation.

Our mix contains 10 per cent. butterfat and 35 per cent. total solids, with .7 per cent. gelatine and 12 per cent. sugar. It is pasteurized and the whole mix run through the emulsor, cooled to below 50 degrees, and aged over night. After freezing, the cream is poured into five gallon cans and hardened in large boxes with ice and salt, as we have not yet got in refrigeration. We find the cream—over half of it—to be "icy," that is, having formed long, thin crystals, especially around the edges of the can for about two inches toward the center. In addition to this, once in a while there is a can in which the sugar seems to have run to the bottom, forming a syrupy mass which becomes very hard and icy, and which occupies about three or four inches in the bottom of the can. These are our only troubles with the cream, and even when icy it has a good, smooth, creamy taste, is not granular, sandy, watery or in other ways off quality. We have gone thoroughly into proportions of the mix, and are positive that nothing is wrong up to time of hardening, as it is thoroughly mixed and emulsified, also freezer is working properly. We have been of the opinion that too slow or too fast hardening, due to ununiformity of hardening with ice, is the cause, also fact that cream often becomes soft during day while waiting for ice, etc., and is then repacked and rehardened. However, after doing our best to rectify such conditions, we are still having the same trouble, and we are very anxious to straighten things out. We have written and consulted several salesmen supposed to be "experts" in such matters, without avail, receiving almost exactly opposite suggestions in many cases. It you can give us any help in this connection we will appreciate the favor greatly.

Thanking you in advance for anything you can do for us, we are, Yours very truly,

——— ICE CREAM CO.

* * *

We have received the following answers to the questions raised:

Trinidad, Colo., September 10, 1921.

Ice Cream Review: I beg to suggest the following remedy or method of process to combat the trouble your correspondent is having with his ice cream.

Be sure your gelatine is high grade goods; age your mix as long as possible without getting sour (at least 24 hours, or better 48 hours) if you are fixed to hold the mix that long before freezing; add one ounce of Meloine or Gumpert's ice cream improver to each five gallons of mix, freeze before it gets too thick (otherwise the cream may become sticky). Then get two five gallon tubs, put ice and salt around the cans and see that the cans are frosted inside before pouring the mix in; use about 8-10 pounds salt at the first packing—repack in about three to four hours and also repack with less salt at least twice a day.. Until the cream is sold and leaves your plant, it will be well to cover the tubs with a few damp sacks so as not to melt the ice

too fast. I have advised to use tubs as I think you are not getting the right temperature in the boxes which you use for hardening purpose.

If anything is not quite clear, I shall be glad to advise you again. Yours for success,

K. CHRISTOFFERSEN,
627 Arizona Ave., Trinidad, Colorado.

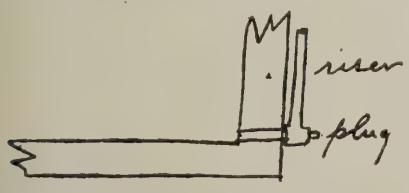
"Two Troubles Instead of One."

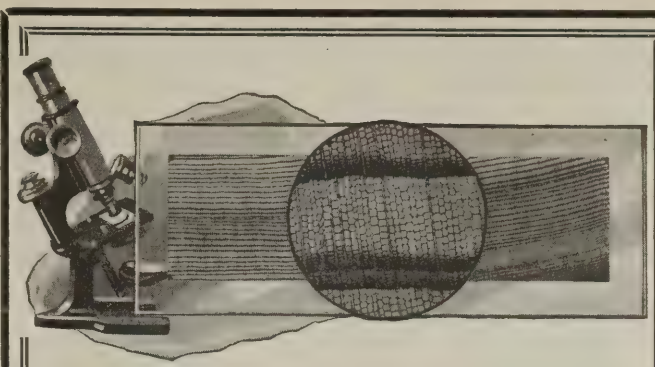
Gibson City, Ill., Sept. 27, 1921.

Editor, Ice Cream Review:



Dear Sir: In your September issue, on page 152, under the title of "Who Can Help?" I note a call for help from a brother ice cream man and, while I do not pose as an expert in such matters, as I have had similar trouble, I will tell you what I did to overcome it.

I think he has two separate and distinct troubles instead of one, as from his description he is up against the same things I had to overcome two years ago.



First, he is using a steam jet emulsifier and emulsifying the sugar with the rest of the mix. I tried this and found that the heat of the steam added to the heat of pasteurization was sufficient to partly burn or scorch the sugar and the result was an inch or two of dark brown syrupy ice cream in the bottom of the can. I was using a tub freezer at that time so did not get this stuff into the packing cans, but it meant quite a loss until I quit adding the sugar before pasteurization. I got the best results by making a raw mix of butter, milk powder and water, using HALF the required amount of water, pasteurizing this to 140 to 145 degrees, hold for 20 to 30 minutes, cool to about 120 degrees, then run through the emulsifier and cool to about 32 degrees. Age this a day or two and when ready to use add the rest of the water, the sugar, flavor, gelatine, etc., and mix and freeze. By doing this I got rid of the syrupy condition.

His other trouble, I think, is the result of the manner of packing in the slush box. I have seen several factories using slush boxes and the usual method seems to be to first empty the box, then pack the empty cans in it, with ice and salt, and as the ice cream is drawn from the freezer to pour it into these cans. They then handle the slush box the same as a can packed in a shipping tub, that is, draw off the melted ice (brine) and repack every so often, some even keep the slush box drained all the time. I tried this method and had much icy ice cream also, at times, soft ice cream.

To overcome this I installed a pipe drain as close to the bottom of the box as possible and just outside the box was a tee (see cut) with a plug in the end and a 16 inch pipe riser as shown here. This gave a brine level in the box of about 18 inches and the overflow over the top of the riser took care of any excess brine. By slanting the riser to one side any desired brine level can be had or the box drained entirely, the plug can be removed to clean the pipe in case it clogs up at any time.

To pack fresh ice cream. The ice cream was transferred from the freezer to the packing can and this can then immediately placed in the slush box. There should be plenty of crushed ice in the brine so that the cans will stand upright and the riser should be slightly slanted so that the cans will not cause the brine to rise enough to get into the ice cream. When the box was full or the freezing done the cans were covered with

Why REDWOOD makes Ice-Saving Ice Cream Cabinets

THE microscope tells why Redwood is unsurpassed as an insulating wood. It has a remarkable cellular structure—layer on layer of tiny cells uniform in size and shape. In properly dried Redwood, these cells form countless dead air pockets which are highly resistant to the passage of heat or moisture. They give Redwood an even texture and uniform high insulating qualities—make Redwood ideal material for ice cream cabinets, refrigerators and for cold storage compartments.

Redwood an Unusually "Still" Wood

Properly dried Redwood "stays put." Under all conditions of heat and moisture, it is subject to a minimum of contraction and expansion—is practically free from swelling, warping or shrinking. Joints stay tight. This, combined with its high insulating quality, makes Redwood an ice-saver, and keeps ice cream in salable condition.

Resist Rot

A **natural** preservative which impregnates every fibre of Redwood during the growth of the tree, guards it against rot and decay from moisture, acids and salts. Vats and tanks of Redwood give exceptionally long and satisfactory service in plants where dairy products are prepared. Redwood is, moreover, odorless.

Other Properties of Redwood

Light in weight and with a fine texture, Redwood is easy to work. It takes paint or varnish better than most woods. The wider-than-usual Redwood boards, with minimum of knots keep manufacturing costs down. Leading manufacturers of dairy and cold storage equipment are constantly increasing their use of Redwood.

MANNING MANUFACTURING COMPANY
Rutland, Vermont

MANNING EQUIPMENT

layers of crushed ice and salt as deep as desired. I repacked from two to your times a day, depending on whether the ice cream was hard or new and soft. To repack slightly slant the riser, then tamp the ice down around the cans, forcing it into the brine. I did not draw off any brine but simply let it flow out over the top of riser. This keeps an even temperature in the slush box so long as the proper proportions of ice and salt are added. The temperature can be easily taken at any time by slanting the riser, letting a little brine run out, then catch a cupful and take its temperature with a thermometer. I found this method took less ice and salt, was less labor and kept the ice cream in better shape. Also no more icy ice cream.

My experience is that a slush box will turn out just as good ice cream as a hardening room, if properly handled. Also it will harden the ice cream quicker, but it requires more attention and skill to keep it just right. Many dealers have soft ice cream or icy ice cream even with the best of cabinets as they let it soften, then repack and harden. The difference between a cabinet and a slush box is only a question of size. I used a box 40x50 inches (inside measurement) for 100 gallons, or 10 inches square to the can. Depth, 30 inches in the clear inside or about 8 inches of ice over the cans.

I hope this information will help the other fellow and if there is any more information I can give him I will gladly do so. Yours very truly,

L. S. FRITH.

The Cause of Icicles.

Editor Ice Cream Review: On page 152 of September Ice Cream Review, is an inquiry regarding cause of icicles forming in Ice Cream from edges of can towards the center.

A few years ago I operated a continuous disc freezer. We were receiving many complaints of the same nature, icy around edge of can. We remedied our trouble by chilling the cans first and using an Ice Cream tub into which we had put a cabinet cylinder and ice and salt around it to keep the can cooled while being filled.

From this we learned that ice cream which melts from coming in contact with a warm can usually freezes up icy around the edges. Judging by this man's letter it seems that the fresh ice cream is not set into the tanks immediately. If he will set his empty cans to be filled into the holding vats, place the covers on the cans and then ice them up using the regular proportion of ice and salt, and then transfer fresh frozen ice cream from the freezer directly into these chilled cans, the ice cream has no chance to melt but begins to harden immediately, thus overcoming the icy condition.

Ice cream which has been through the freezer and then allowed to melt a little before hardening, the melted portion will always freeze up icy.

Yours truly,

The Haydon Company
W. S. LARSON
Supt. Ice Cream Dept.

* * *

In a recent issue we also published the following request for information:

A subscriber to the Ice Cream Review writes that he is using corn oil for the purpose of greasing cans for winter storage. He is wondering whether any other preparation is giving satisfaction elsewhere. Your experiences would be appreciated. Send them to The Ice Cream Review, for publication.

Replies to this inquiry are as follows:

Gentlemen: In answer to your letter of September 27th, we do not grease any of our ice cream cans for winter storage. We wash and sterilize these cans before storing, and then store them in a good dry room where no moisture can get at them. In this way we have no trouble with rusty cans from storing during winter.

I see no harm in using oil or grease for storing cans as long as same is free of acids. Yours truly,

T. T. B. Co.

* * *

Gentlemen: Replying to your subscriber who wants to know what is the best material to use in greasing ice cream cans for storing in winter, to prevent rusting, beg to advise that we have always used vaseline with beneficial results.

W. W. D. Mgr.

* * *

We do not find that is it necessary to grease ice cream cans when storing them away for the winter. We simply dry them out and stack them in a dry place.

I. I. C. Co.

* * *

Gentlemen: We purchase a low grade of vaseline from the Standard Oil Company to grease our ice cream cans for storage. We find it economical to warm our cans as well as warming the vaseline before spreading it on the cans.

This grease is applied with a 4 inch brush. We would appreciate any helpful suggestions along this line. H. C.

THOMAS W. DUNN CO. WILL EXHIBIT IN BUFFALO

The Thomas W. Dunn Company booth at the Eastern Exhibition of the Association of Ice Cream Supply Men will be in charge of Mr. F. E. Hellweg, who will have with him the chief executive of the company, Mr. Henry Rosenstein, and also a number of salesmen. The exhibit will consist of all grades of pure food gelatines in granulated, sheet and flake form.

Dunn's gelatines are especially produced and blended for use in ice cream manufacture.

"In this connection," says Mr. P. H. Manners, secretary, "we would like to point out as a matter of interest that the use of gelatine in ice cream was originally introduced by the founder of our house, the late Mr. Thomas W. Dunn, and the gelatines which we are selling today are produced as a result of the experience which we have gleaned for a period of 42 years, during which time we have probably turned out larger quantities of ice cream gelatine than any other concern in the business.

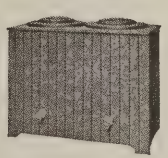
Besides being the first bulk gelatine house to specialize on gelatine for use in the manufacture of ice cream, we have recently acquired the trade mark rights of Cox's gelatine in the United States and Canada, which is the oldest package gelatine on the market.

Cox's gelatine has been sold in the United States and Canada since 1845, and has always been regarded as the standard for purity, uniformity and general excellence. House-wives all over the country are familar with the red, white and blue checkerboard box.

Very truly yours

THOMAS W. DUNN CO.
Per P. W. Manners.

The Significance of the "B"



The Bee has long been known for its energy and constant industry. So has B. Riley Hauk, our president, who has had forty years' experience in the Creamery, Dairy and Ice Cream Makers' machinery and supply line. Mr. Hauk still has the same old pep, and is anxious to serve you by giving you the benefit of his experience in our line.

The "Bee" in our trade mark is also significant of the letter "B" in Mr. Hauk's name to distinguish it from any other company, as he is solely connected with and interested in the

Do You Run Your Car Without a Speedometer?

To Measure Your Batch is Just as Essential as to Measure Your Mileage.
By Cherry-Basset Co., Philadelphia, Pa.

"THE best investment we ever made in our plant;" "Do not see how any manufacturer can afford to be without it;" "Does far more than was claimed for it;" "Count me as a real booster."

The reader would almost assume that any article which would elicit such praise must almost have received the magic touch of Aladdin and his lamp. This however is not a fairy tale but rather the account of a practical working device which has been developed not through the magic wand of an Aladdin but from the practical experience of the ice cream business. Once again has the old axiom proven true, "Necessity is the mother of invention".

May we ask the reader what single thing has been more sorely needed in an ice cream factory than some device which would prevent the many leaks and wastages incident to the present method of handling ice cream mix from the sanitary line to the freezer. Almost every other step in the manufacture of ice cream has been standardized and through standardization not alone has more uniform and better ice cream been produced, but great savings have been affected.

The Thomas batch measure has finally in its perfected shape taken its place in the ice cream industry alongside of the many other improvements which are making its possible for the ice cream manufacturer to effect economies hitherto impossible and also to arrive at costs of his product which before have been largely a matter of guess work.

Attached on the sanitary line leading from the holding vats and doing away with the present open style batch can the new Thomas batch measure is at once a device having both ornamental as well as many useful qualities. It has the distinct advantage that it can be attached to any make, style or size of freezer.

The simplicity of the apparatus, the ease with which it is kept clean appeal at once to the practical ice cream man. As one user recently remarked "It is fool proof and the best part of it is they have to use it." While it is true that its simplicity makes it fool proof and that it has to be used, yet with hardly an exception the men who operate it are its biggest boosters. For them it saves time, does away with all worry of overflows and overruns and furnishes a constant check on the amount of the day's make. For the plant owner it prevents the losses always occurring through careless operating, through valves being left open on the sanitary line, through spillage from the over-flow of the batch can and most important in this respect prevents the overloading of the ice cream freezer. It also assures him uniform colors and flavors where these are added at the freezer. Through the recording device on the measure the finest freezing room report sheet that has ever been possible is available for any who care for a careful tally of their days work. Costs such as flavor cost are now possible through knowledge of how much mix has been used to make each flavored ice cream. This has always been a matter of guess work.

Summed in the words of still another user, "There is no single thing in my plant which does as many different things for me as does that measure". That it is a real investment is apparent when one user of five forty quart freezers reports an actual saving of $25.00 to $30.00 per day on a manufacture of a thousand gallons of ice cream per day.

Anything which has the merit of appealing to the smallest as well as the largest ice cream manufacturer deserves a careful investigation, and all visitors to the Buffalo Exhibit of Ice Cream Supply Men should make it a point to see this device at the booth of the Cherry-Bassett Co., especially if you did not see it at the National Dairy Show.

Automatic Cone Machines

with which you can make a better cone, at a less cost, than with any other known device.

The Cream Cone Machine Co.
CLEVELAND, OHIO

SOON TO START ERECTION OF BIG FACTORY

Negotiations have been completed for the purchase of a site for the proposed new plant for the manufacture of ice cream, to be erected in Los Angeles, Cal. by a recently formed company, which is headed by W. E. Keller, president of the Globe Milling Company, and A. A. Comey, formerly vice-president and general manager of the Christopher Ice Cream Company.

The project including plant and equipment will represent a total investment of $700,000.

The factory will have an estimated capacity of 1,000,000 gallons of ice cream per year, and through the introduction of modern machinery and methods of manufacture, the price to retailers can be considerably reduced, it is claimed. Ten Walker electric trucks will be used for the distribution of the ice cream, gasoline trucks being used only for hauling supplies to the factory. The plant will be under the direction of Mr. Comey, who has had considerable experience in this work. The company plans to extend its operations to other cities of the Pacific coast at a later date.—Los Angeles (Cal.) Times.

Condensed Milk and Milk Powder

(BY OTTO F. HUNZIKER)

THE THIRD EDITION of This Book Has Just Come from the Press.

This work represents a new book from cover to cover. It contains the description of the latest equipment and of the most improved methods and practices in the manufacture of every marketable line of condensed and dried milk products.

The More Outstanding New Features Are:

- New methods for cooling sweetened condensed milk to prevent grittiness and sugar sediment.
- New methods for sterilizing evaporated milk to prevent formation of a permanent curd.
- Viscosity tests.
- Condensing and drying of buttermilk by commercially practical methods.
- The use of the Ruff Condenser.
- Description of 20 different processes of desiccating milk by the dough-drying principle, the film-drying principle, and the spray-drying principle.
- Detailed discussion of the commercial manufacture of powdered milk.
- Cost of manufacture, composition solubility, properties, defects and keeping quality of milk powders.
- All other chapters have been revised so as to make available such information as will be of the greatest service in the successful manufacture and marketing of condensed and dried milk products under the new and changed conditions of the industry.

The price of this new and enlarged volume is $5.75 per copy.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

AUGUST 1921 RECORD MONTH FOR CUBAN IMPORT

Figures of the Bureau of Statistics, Department of Commerce, covering imports and exports during August show that 285,426 short tons were imported during the month, valued at $18,119,553.

It is worth noting that of this total 240,305 short tons were imported from Cuba, this sugar being valued at $13,817,785, the next largest seller to this country being the Phillipines with 30,674 short tons, valued at $3,398,357.

San Domingo ranks third with 13,024 short tons of sugar, valued at $710,390.

Imports are More

With the exception of August, 1920, the imports were higher than those for August of the preceding six years, while over the period of eight months from January 1, the total imports seem to about hold their own, again with the exception of 1920, when abnormal conditions prevailed.

No beet sugar was imported during the month under consideration.

Comparative figures covering the month of August and the first eight months of the year for the last seven years, show imports in short tons of 2,000 pounds as follows:

Year	August	Eight Months
1921	285,426	2,215,759
1920	441,114	3,286,161
1919	195,248	2,557,645
1918	170,120	2,097,636
1917	197,615	2,134,133
1916	186,112	2,248,806
1916	216,424	2,237,198

Of the full duty paying sugars the bulk came from Santo Domingo, receipts from other countries aggregating only 1,419 short tons.

Receipts of Year

The following figures, in short tons, show the detailed receipts for the month of August and for the first eight months of the year:

From	August	Eight Months
Santo Domingo	13,024	107,997
Central America	412	21,203
Mexico	779	11,683
Brazil	225	3,216
Peru	....	10,247
Venezuela	....	3,205
Other So. America	....	4,393
British West Indies	....	1,993
Other West Indies	....	6,390
Hong Kong	3	525
Dutch East Indies	....	17,028
Other Countries	....	2,236

Of the total imports 169,928 tons were brought in through the port of New York; 35,503 tons through Philadelphia; 24,816 tons through Boston; 25,047 tons through New Orleans, and 13,307 tons through Galveston.

Exports of refined sugar for the month totaled 66,527 short tons, valued at $6,323,581, the largest buyers being Great Britain and France.

The export figures for August and for the first eight months of the last seven years are as follows in short tons:

Year	August	Eight Months
1921	66,527	353,100
1920	4,761	415,158
1919	59,549	519,890
1918	22,069	71,745
1917	78,400	385,938
1916	84,320	631,499
1915	76,403	229,355

The exports of refined sugar for August and for the first eight months of the year were to the following countries, figures given being in short tons:

Exported to	August	Eight Months
Great Britain	33,453	148,810
France	18,023	42,229
Greece	2,419	37,888

THE MOVEMENT OF SUGAR PRICES

The editorial, Facts About Sugar, remarks that recently the New York market for raw sugar for the second time this year registered the extreme low price of four cents a pound, duty paid. It is significant that on both occasions the holders of raws offered such stubborn resistance to the pressure for the further downward movement of prices that the low basis was not long maintained but yielded to a moderate advance. On the first occasion this development led the way to the very substantial buying movement that went on during the month of July. Whether the previous record will be duplicated in this respect remains to be seen, but there are unmistakable signs of at least a temporary improvement in trade demand.

At the beginning of the year 96 degree test sugar was selling in New York at 5.39 cents a pound, duty

paid. After a slight advance to 5.52 cents the price gradually fell off until it stood at 4.52 early in February. About this time announcement was made of the proposed appointment of the Sugar Finance Commission to take charge of the sale of the Cuban crop and this resulted in an upward movement which carried the price to 6.27 cents during the latter part of March.

From this point a gradual decline set in which carried the price down to 5.06 cents at the end of May when the emergency tariff bill became law. The duty paid price being unchanged the higher tariff rate had the effect of depressing the cost and freight quotation on Cuban raws or in other words of passing the increase in duty along to the shoulders of the foreign producers.

During the month of June the Sugar Finnace Commission remained withdrawn from the market but the price of raw sugar steadily declined until it reached the four-cent level at which it remained during the ballance of the month.

Throughout this period the refining interests that had been most active in attempting to force raw prices to the lowest possible level continued their efforts in this direction with redoubled vigor, issuing statements to the effect that supplies were so greatly in excess of requirements that no more of the commission controlled Cuban sugar would be needed during the year. Despite this propaganda and the maintenance of a fictitiously low paper quotation for refined sugar it proved impossible to break the raw market below four cents, or indeed to hold it at that level. The practical exhaustion of trade stocks soon began to make itself felt and the Sugar Finance Commission was able to re-enter the market early in July and to sell a large quantity of its sugar at 4.61 cents, duty paid, later increasing its quotation to 4.86 cents where it has since remained.

During the present month the conditions prevailing in June have been practically reproduced. Trade demand for refined sugar has been inactive, refiners' operations have fallen off and with little incentive to purchase raws such offerings as have reached the market have been disposed of at steadily declining prices which brought the quotation on raw sugar down to four cents again on September 15. At this point sellers again showed resistance which made it impossible to force prices lower and the four cent price held good only for a week when an upward movement of one-eighth of a cent occurred.

Students of price movements hold that when a downward swing to a previous low level is repeated without being able to carry beyond that point it is an evidence that bottom has been touched and that a gradual recovery is in order. If this theory is correct it is reasonable to anticipate a moderate further rise in sugar with a decided increase in activity. The technical position in sugar with the low state of refiners' and distributors' stocks is favorable to such a development at the present time.

In view of the relatively large supplies of beet and Louisiana cane sugars that are about to become available in addition to the unsold balance of the Cuban crop it is not to be anticipated that any very great advance in prices will take place, but the evidence that the market has given of unwillingness to go below the four cent level should impart greater confidence to the trade in placing orders at or near the present basis.

It is argued that so great a decline already has taken place in the price of sugar that a further decrease at this time would not materially stimulate demand. As has been repeatedly pointed out in our columns sugar at its present price unquestionably is the cheapest foodstuff that can be purchased, but the average consumer is not informed as to the relative dietetic values of dif-

ferent foods and since he bases his judgment of the cheapness or dearness of a particular commodity upon the relation of its price to that which he has been accustomed to pay every decrease in price naturally leads to an increase in consumption. On the other hand the decline in prices within the past year has been so much greater than that which has taken place in other staple commodities and this fact is so well understood by the public that minor fluctuations are likely to have far less influence upon the demand from consumers than upon that from the trade. A more marked influence undoubtedly will be exercised by the gradual improvement in general business conditions which is now beginning to make itself manifest and which should lead to a steady increase in the use of sugar.

* * *

NEWS OF THE CUBAN SUGAR INDUSTRY

The following article is an interesting one prepared by H. O. Neville, who is the Cuban correspondent for Facts About Sugar, and will be of interest to ice cream manufacturers:

Havana, Cuba, Sept. 16.—A week of insignificant and scattered showers has just passed. Heat has been intense, winds moderate, with every indication of a visit from the tropical storm heading northwest from Trinidad, but this veered east of Cuba without even an additional quantity of rain to indicate its passage. In many places in the island the ground is very dry down to a depth of more than a foot, and a good general rain would be beneficial.

The number of mills operating has been lowered to three, "Delicias" having at last completed its campaign. The number of bags made sets a new record, this having been 768,378, as against an estimate of 700,000, and a crop last season of 578,738 bags. The other three mills, "Boston", "Preston" and "Santa Lucia" are still grinding steadily, but are believed to be rapidly exhausting the cane available to them.

Receipts Are Heavy

Sugar statistics for the week ending September 10th indicate a continuation of rather heavy receipts, these having been 20,815 tons, with a very marked lowering of exports, which were only 33,200 tons. No withdrawals of sugar for home consumption leaves stock in ports 1,198,444 tons, between three and four times that of September 11, 1920, and nearly twice that of September 11, 1919. The exports for the week were all for the United States, mostly to points north of Hatteras, with the exception of 8,394 tons to Great Britain. Thus total exports have now passed the 2,000,000 ton mark, but over 1,900,000 tons remain yet to be disposed of.

Quantity is Lower

The quantity of uncontrolled sugars still to be shipped is slowly diminishing, as of August 31st there remained the following:

Shipper	To whom sold	Bags still to be shipped
Marcelino Garcia	Imperial S. R. Co.	356,343
United Fruit Co.	Revere S. Co.	108,784
United Fruit Co.	Revere S. Co.	188,148

The "promedios" for August have just been announced, these being as follows:

	First fifteen days	Second fifteen days	Month
Havana	2.73876	2.33781	2.73625
Matanzas	2.94629	2.54597	2.94441
Cardenas	2.86255	2.46150	2.86004
Cienfuegos	2.78817	2.38722	2.78566
Sagua	2.88911	2.4881	2.88660
Manzanillo	2.75223	2.35128	2.74972

The "promedio" for the first fifteen days was given out by the College of Brokers of Havana, but that of the last half of the month and of the full month was given out by the Secretary of Agriculture, in view of the fact that the Executive Board of the Havana College of Brokers has resigned and has not been replaced.

We gave a list in our recent letter of the sales effected during the entire month of August, and according to it the sales during the last half of the month consisted of only 3,020 bags of a total value of $28,592.66. The sales of the first half of the month consisted of 477,834 bags, worth $4,187,766.16.

Cancels Pay Raises

Decrees issued by the President during the past week have annulled all the increases in pay or salary formerly given to the laborers of the Government and forcing a readjustment of their wages, this readjustment to commence with the second fifteen day period of this month, that is, to become effective yesterday. The reduction to be made was not specified, the words of the decree defining that it should be "adequate". In another decree the president authorizes the payment of all pensions granted to members of the Army of Liberation and aiders of the Revolution, only in that proportion permitted by the funds available for this purpose, the total sum available being subdivided equitably among all those entitled thereto. President Zayas is giving every proof of the fact that as far as he himself can bring it about, economy in Government is prevailing, yet, notwithstanding this desire on his part, the joint commission from both Houses of Congress has, it is said, decided upon a budget for the current year of almost $65,000,000.00, estimating the probable receipts of the Government at $72,000,000.00.

Not only in Government lines is the tendency shown to lower wages, but it seems that at last a serious attempt is being made by the Association of Commerce and Industries of Havana Harbor to lower the wages being paid to the stevedores and others connected with the reception and dispatch of cargo. A commission has been appointed from among the members of the Association, consisting of Messrs. Smith, Donaphan, Cartaya, Stoddard and Latimer to study this question and to formulate a questionary which shall be sent to each member of the association to obtain his individual opinion concerning the problem. In addition to the lowering of wages of the laborers, will be studied the relation of the association to the delegates of the various workmen's unions of the harbor.

Modifies Former Order

President Zayas by a decree issued on the 6th of this month has modified a former decree authorizing the repatriation of foreign laborers who find themselves without employment in the Island, this modification prescribing that laborers from Haiti, Jamaica and the other Lesser Antilles contracted for labor in our agriculture shall be sent home for the account of the government, on account of their constituting at the present time a menace to the public peace of the island.

It is also further provided that those immigrants from these same countries who came to Cuba without contracts and who find themselves in a state of indigence, may also be sent home in groups without fulfilling the requisites of Article 5 of Decree 144, dated the 20th of July of this year, if the request for repatriation be submitted to the Secretary of Agriculture, Commerce and Labor through the agency of the Secretary of State by the Diplomatic Representative of the country from which the immigrants have come.

Inspectors Are Needed

Further attempts to make the Railroad Commission fulfill the ideal of such an organization held by the commercial public have resulted in the recent appointment of an inspector for each province, these inspectors being supposed to keep a general watch of railroad movements and conditions in the respective provinces and to report thereon to the commission. As inspector for Pinar del Rio Province, Sr. Eladio Blanco has been appointed; for Havana Province, Sr. Adalberto Senado; for Matanzas Province, Sr. Nicolas Sirgado; for Santa Clara Province, Sr. Benigno Frano; for Camagney Province, Sr. Federico Silva; and for Oriente Province, Sr. Juan Cruz Sota. As technical chief of these inspectors, Sr. Milian Alvarez Aragano has been appointed.

The use of alcohol as fuel for our internal combustion engines is increasing, and propaganda is still active tending towards a still further increase in its use. The suggestion has just been made in our financial press that a day be named for the holding of a monstrous celebration and procession, this day to be christened Alcohol Day, and to be recognized as a legal holiday and celebrated in all the towns and cities of the island.

Farmers Hard Hit

Continuous references are being made in our press to the conditions prevailing in the country districts, in which in many places groups of cane growers and other farmers have appealed to the municipal authorities of the location cited, begging that some public work be begun in order that they obtain employment and at least wages sufficient to purchase the food they require for their daily sustenance. From Colon, the center of a very large and rich agricultural section of Matanzas Province, the mayor has advised the Secretary of the Government that conditions there are desperate, as practically all the country stores have closed, due to the inability of their owners to continue furnishing supplies to the colonos who are already deeply in their debt.

Sellers Ask Payment

The owners of the stores state that the importers in Havana and in other places from which they obtain their supplies, have refused to furnish them further provisions, unless accounts already contracted be paid.

FUTURES MARKET IRREGULAR

A sudden rise in prices Sept. 29th followed by an equally sudden decline the next day marked the course of the raw sugar market on the floor of the sugar exchange. Earlier the market was virtualy without appreciable fluctuations.

The range of prices was as follows:

	High	Low	Latest
Raws—			
September	3.00	3.00	3.00
October	2.60	2.60	2.60
December	2.59	2.40	2.52
January	2.45	2.38	2.45
March	2.48	2.38	2.41
May	2.57	2.40	2.50
July	2.67	2.59	2.67
Refined—			
September	6.05	5.80	6.05
October	5.50	5.35	5.50
December	5.25	5.25	5.25

"W. B. ATTEBERRY DIED OCTOBER FOURTH."

This was the short but sad message which Gabe S. Wegener, president, The Hudson Mfg. Company, Chicago, received on Tuesday, October 4th. "Just when our first fears had given way to high hopes of recovery," said Mr. Wegener, "came the telegram that was a shock to our entire organization, for we all loved "Bill" as a friend, as well as a co-worker."

W. B. ATEERBERRY

W. B. Atteberry was injured in the auto stage accident as reported in our last issue. He was getting along wonderfully well when tetanus developed Monday, September 26th. He suffered terribly until the end came on Monday, Oct. 3rd, at 5 p. m., Oakland, Cal.

Mr. Gabe Wegener, who loved "Bill" as his own son, is deeply grieved at the sad death of W. B. Atteberry, and it was only with the greatest difficulty that he could speak of it at all, stating in part: "He was a very honorable and square fellow and had endeared himself to every one he came in contact with, both in business and social way. This was demonstrated by the flood of telegrams and letters received by Mrs. Atteberry. Everyone had a kind word for Bill Atteberry, and his loss will be keenly felt as a member of the Hudson organization. Words fail to express how grieved we are over his death."

He is survived by his wife, father and sister. Mr. Atteberry was a member of the Salesmens' Club, Association of Ice Cream Supply Men. Burial was at Hollywood, a suburb of Los Angeles, Calif.

"THERE'S A REASON."

When our representative asked Mr. H. C. Burdick, president of the Burdick-Garrison Co., Inc., of New York, if he would be in attendance at the Eastern Exhibition of the Association of Ice Cream Supply Men at Buffalo, he replied: "that if for no other purpose than to extend his personal thanks and appreciation to those whose untiring efforts have made possible the exhibition, he would most certainly be there."

Mr. Burdick said, "that the renewal of old friendships, and the making of new ones, would be worth many times the cost of a journey much further than Buffalo. But of still greater value would be the benefits derived from an intimate exchange of ideas with those who are every day meeting and surmounting the myriad difficulties that face every ice cream manufacturer."

"Business has turned the corner, and soon we will see the dawn of a new era of prosperity," continued Mr. Burdick. "Not the frenzied, counterfeit prosperity of a world at war, but the prosperity resulting from the determination of America to retain her dominant position in the industrial world."

For many years Mr. Burdick has been a close student of the problems that are the common lot of all ice cream manufacturers—particularly those of how to increase ice cream sales. As an "advertising specialist to the ice cream manufacturer" he has helped solve the problems of "increased gallonage" for many of America's leading manufacturers. Mr. Burdick said that the Burdick-Garrison Co. had very gratifying results from a new "Planned in Advance" advertising and sales effort campaign that was used by a number of their clients this past season.

Speed Up

Increasing Ice Cream Sales in Winter

Address by W. M. B. SINE, Manager, Imperial Ice Cream Company, Clarksburg, West Virginia, before National Association of Ice Cream Manufacturers, October 12, 1921

Increasing ice cream sales in winter is the biggest problem in the ice cream business today. This subject, I think, is on the program with the idea of starting an argument, for just like all the rest of you, I "see red" during the winter months, but in my opinion, winter sales can be increased. The trouble is we are licked before we start. We think it can't be done, and, consequently, it is not. The whole trouble is that we have been in the habit of pinching down on the service and getting grouchy when frost came, really selling ice cream in the winter under protest. In other words, we were bears instead of bulls and trying to sell our ice cream short. The candy man doesn't let down when warm weather comes. He works harder. So does everybody else engaged in alleged seasonable businss.

W. M. B. SINE

Now from what I can observe there is no reluctance on the part of the public to eat ice cream every day in the year if it is offered to them. Every formal dinner, even if served on the coldest winter night, includes ice cream; every hotel continually includes it in its menu, and when your wife or my wife plans a dinner party the weather has nothing at all to do with what she serves for dessert.

Just sitting back and saying "it can't be done" doesn't seem just right and so with the idea of trying an experiment at one of our branches three years ago, we decided to distribute some of the advertising appropriation for that particular plant over the lean months, as we found the hot weather gave enough momentum in the summer to carry sales along without the additional acceleration that advertising furnished. We started that advertising with the waning of the season and kept increasing gradually until spring business started, when we let down. We made our product just a little richer, gave just a little bit better service, saw to it that the stock in dealers' hands did not get old, coarse and grainy or flavorless, as ice cream will get when kept too long. We also made special flavors to add variety and tempt the jaded appetite.

To call attention to these specials, we used window streamers and window displays even in the coldest weather of the year at the expense of being considered weak-minded. We also had a series of direct-to-the-consumer advertising in the form of announcements, in which was suggested new flavors and novelties in which ice cream could be served in the home, hot sauces, recipes, etc. Our order clerks scoured the papers for notices of lodge, church and other affairs.

When we took stock at the beginning of the summer season, we found that we had kept more of our organization together than in the previous years; the milk producers were in a sweeter frame of mind, and best of all, dealers were in line and more enthusiastic.

The following year we tried it out on a second plant, let up on advertising a little at the first plant, but not on the service, and we carried two of our plants through without red figures. Last year, with the help of the weather man, five of our plants increased their sales sufficiently to overcome the usual red figures.

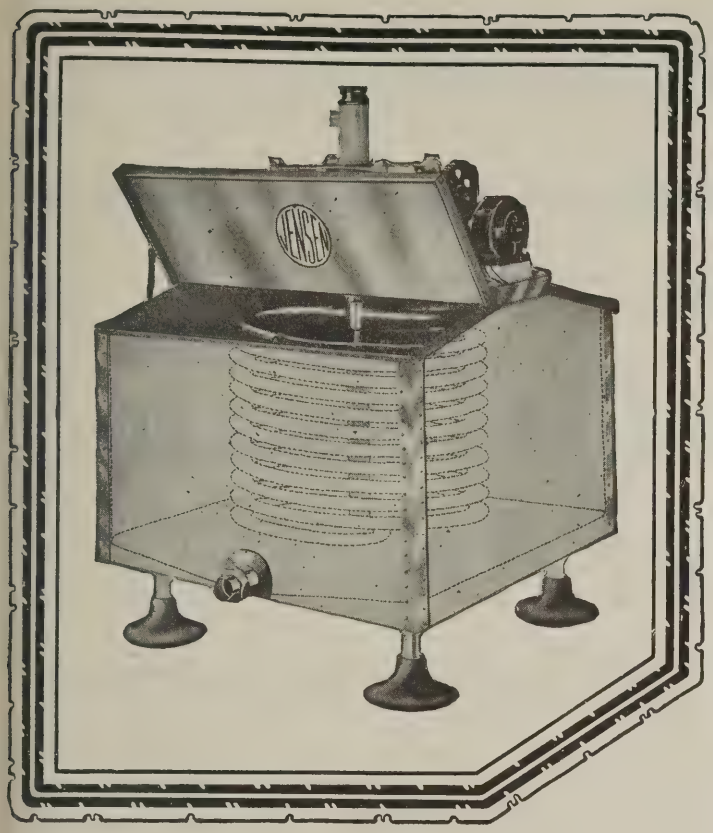
This fall we started the campaign on a more elaborate scale. Per cent average for the winter months before and since going after winter sales were as follows:

	1917-18	1918-19	1919-20	1920-21
October	.04	.04	.08	.09
November	.02	.02	.05	.06
December	.02	.02	.03	.05
January	.01	.02	.03	.05
February	.02	.02	.03	.05
March	.04	.04	.05	.07

I want to stress a little bit the effect of winter advertising on our dealers. They quickly realized that we were out to do something and after awhile they took hold too and did their part. Instead of getting listless and indifferent in their service, the winter months found many of them on their toes and when spring came we had team work that accelerated our summer business.

And another by-product of our advertising which we had not forseen has been the effect on our own employes. The growing business keyed them up too. They had to live up to the advertising and instead of the rather perfunctory service which they had heretofore given dur-

Vanilla Custard Ice Cream



PLAIN?—Yes, but, oh, how delicious! How full of the sweet, billowy goodness that only pure, rich cream can have! How temptingly flavored; how generously filled with fresh, wholesome eggs! But—you must decide for yourself. Have a plate of Imperial Vanilla Custard Ice Cream at the nearest fountain and take some home for the family—they will pronounce it the finest Ice Cream ever prepared.

Of course, it's the Special this week in

ing winter months, why we got pretty enthusiastic work and thereby we kept our organization together through what we commonly called the dull season.

We haven't been niggardly about spending money, but we haven't been wasteful. Big newspaper advertisements cost money but big advertisements have the habit of starting people to think and what we wanted was to get them to think about our ice cream. We also made every possible effort to have these advertisements kick out of the page. Outside of the big city dailies the general run of advertising is often pretty plain stuff and we figured that clean type, good pictures and a general air of smartness was worth all it cost.

We are very well satisfied with the results and hereafter I believe we shall stop bothering about the weather man and go about our business of thinking up ways to make the consumer hungry for ice cream. At the same time we shan't overlook the very important thing of making it possible for him to get it when he has the notion. Thereby we shall help along the general cause of increased business in winter months as well as help ourselves and so far as I have observed this is what we are in business to do.

I haven't preached a doctrine I don't believe. I haven't preached at all, in fact—and this talk is in no sense the imparting of any secret of success. I've tried to tell, in my own way, that ice cream sales can be increased in winter and the proof is the fact that we've done it and expect to keep on doing it.

The Above Is a Reproduction of One of the "Dealer Helps" Used. This Was Printed on a Yellow Sheet 8x24 Inches.

A STATEMENT FROM THE B. & O.
Glass Lined Steel Tanks in Refrigerator Cars for the Transportation of Milk.

A new and so far very satisfactory method for the transportation of milk has been recently inaugurated by the Baltimore and Ohio Railroad Company, through the co-operation of the Harmony Creamery Company of Pittsburgh, by the installation of "Pfaudler" glass-lined steel tanks in refrigerator cars. The experiment, it is understood, is the first of its kind to be tried by any milk transportation concern. The following is a brief description of the equipment:

Three Baltimore and Ohio refrigerator cars, numbered 897, 898 and 899, were selected for this purpose. Their interior dimensions are 39 feet, 9 inches long and 8 feet, 3 inches wide. They were originally equipped with brine and ice tanks for refrigerating purposes; these were removed and two Pfaudler Glass Lined Steel Tanks, 11 feet 2 inches long and 6 feet 5 inches in diameter, were securely installed. The tanks are made of open-hearth steel plate of a seamless welded construction, having a capacity of 2,500 gallons each, or a total of 5,000 gallons, almost double of what can be obtained per car by the use of milk cans. Each tank is furnished with sanitary outlets so that there is perfect drainage. This means that, in addition to having the milk arrive at the station in uniform condition, there is a saving in milk which formerly adhered to cans when they were emptied at the terminals. The tanks are also furnished with openings at the top with quick closing swivel type doors, which are air-tight and thus increases the refrigeration efficiency.

The tanks are also equipped with an agitator, operated by an electric motor, current being taken from the company's plant. This agitator is started a few minutes before the milk is drawn off in order to mix the cream with the milk so as to make it uniform, and it is not run long enough to churn same. The milk is drawn from the tanks by rotary pumps which carry it as high as the car, from which point it can be delivered by gravity. These tanks are also equipped with Taylor index thermometers to show the temperature of the milk in the tanks at all times.

The above mentioned cars are operating over the Baltimore and Ohio Railroad between Pittsburgh and West Farmington, O., a distance of 107 miles, and the temperature loss during the run, which is about eight hours, is not more than 2 degrees. This has been accomplished during the extremely hot weather of August which gives assurance that there is no difficulty in this respect if the milk is sufficiently chilled before being placed in the tanks.

It is claimed by the creamery company that there is a large saving by the tank method, as compared with the can method. This is due to no refrigeration being required en route, saving in labor loading and unloading and in the renewals and maintenance of cans. In addition, the tank method is much more sanitary.

F. X. MILHOLLAND,
Asst. to Senior Vice-President, Baltimore & Ohio R. R.

ICE CREAM

A New Follow-Up Service

That WILL Increase Your Ice Cream Sales

It Has Done So for Others!

During the past season our *new* "Planned in Advance" Advertising and Sales Effort Campaign was used by a number of our clients. The results—both for the large and small manufacturers—were surprisingly gratifying; all plants showed an increased gallonage.

Ice Cream manufacturers are more and more coming to appreciate the value of a carefully prepared in advance campaign of Advertising and Directed Sales Effort as *the* means of increasing their Ice Cream Sales.

HAPHAZARD METHODS MUST BE DISCARDED!

The BURDICK-GARRISON Company's *new* "Planned in Advance" Campaign of Advertising and Sales Effort is *prepared with first consideration to the individual needs of every client.*

Our new "Planned in Advance" Campaign is not confined to any one feature. It covers every phase of Ice Cream advertising and is accompanied by a distinctive FOLLOW-UP SERVICE.

We are prepared to handle the largest accounts, but no account is too small to receive our most careful attention.

Write us TODAY. Inquiries will have prompt attention and you will be placed under no obligation.

SPECIALIZED FOR ICE CREAM MANUFACTURERS AND THE DAIRY INTERESTS

THE NATIONAL DISH

Attention! Western Ice Cream Men

ALMOST important step toward the goal the ice cream manufacturers of the west are striving for is the annual convention of the Pacific Ice Cream Manufacturers' Association. The days you attend this convention you will not only be presented unfamiliar facts on the latest achievements of your industry but will also have the opportunity while there those three days to get out and view a little of the natural grandeur of Seattle and the surrounding territory. Nature gave vent to a feeling of leniency when passing through this particular country and it might be well to mention here what attractions and centers of interest lie in and about the city you visit November 14, 15th and 16th:

The Trip Extraordinary.

No visit to the Pacific Northwest is complete without having seen Seattle's most attractive spots. This special trip is designed to show the tourist sights unlike those in any other American city; to show the big outstanding achievements of this "miracle city" of the West. In the three hours of driving in luxurious automobiles you will be shown the United States government canal locks in Lake Washington, the largest in the world, except those at Panama. You will see just how the great ocean liners are lifted from salt to fresh water by the pressing of an electric button.

Then there is Lake Union, the only fresh-water tidal basin in the world within the corporate limits of a city—$50,000,000 worth of great wooden vessels, built to help whip the enemies of democracy, swing at anchor in the lake. Coursing along Lake View Boulevard, skirting the shores of beautiful Lake Washington, you will be shown the University of Washington, among the most picturesque sites in the country—the old Yukon-Pacific Exposition grounds, where a visit is made to the largest log cabin ever built, now a great museum—through the fashionable University residence district—the training station of the United States merchant marine—the gorgeous formal gardens and cascades—then along a parked boulevard to Green Lake and Woodland Park, with its stately forest monarchs and great zoological gardens, where a bison herd and other rare animals are confined—the route leads from there to the Lake Washington canal locks and Queen Anne hill, known as the Observation Tower of Seattle and from which a sweeping view of snow-clad mountains, shimmering Puget Sound and Seattle spreads out before you—circling the hill you see the ocean-going vessels of many nations coming to Seattle's wonderful harbor and leaving for far-spread marts in foreign climes—the government fortifications guarding the entrance to the harbor, and to the south that vast industrial district, where world's records for ship-building were made during the war. Returning to your hotel, your car passes the busy public markets, the Washington state armory and thence down into and through the heart of the retail district. After such a trip you may feel assured you have seen the "high spots" in the most remarkable city in America.

From Left to Right—J. H. Kugler, Field Secretary; J. E. Dunne, President, and B. H. Walker, Secretary.

Seattle prides itself on having the second largest canal locks in the world. The Lake Washington locks can accommodate the largest ships afloat with less than eighty foot width; cost $3,900,000, and is a piece of construction which is well worth seeing. Seattle has an area of 101 acres of wharves and four acres of dry docks. It contains the two largest docks in the world, the Port Commission Smith Cove docks; each one half a mile long, and the total cost of construction amounted to $4,500,000.

Other facts and places of interest are: (1) There are 1,062 miles of lighted streets which includes thirty-two miles of cluster lights. (2) Ten public libraries. (3) Two hundred ninety-four miles of paved streets. (4) Parks and playgrounds covering 1,820 acres. (5) Thirty-one miles of scenic boulevards. (6) For educational facilities it has sixty-nine grade schools, six high schools and 300 churches. (7) For accommodation of tourists and guests it has 75,000 hotel rooms and four transcontinental railways, 190 miles of water front and sixty-five steamship lines. (8) The Alaska exhibits, chamber of commerce, Arctic Building, State University, University Stadium and free museum in great Temple of Forestry; also the Washington Art Museum at 1417 Fourth Ave.

Side Trips of National Fame.

By short auto trips from Seattle one may see: (1) Mt. Ranier, a gigantic peak 14,408 feet high, with accommodations for tourists at Ranier National Park, just a 110 mile trip from Seattle and return. (2) The Snoqualmie Falls, three hundred and sixty-five feet high; a wonderful 33-mile trip either by train or auto. (3) Lake Crescent, Olympics. (4) Lake Cushman, in the Olympics. (5) Cedar Falls. (6) Green River Gorge.

From Seattle by boat: (1) Hood's Canal. (2) Victoria, B. C. (3) San Juan Islands. (4) The Bremerton Navy Yards, having the largest dry docks on the Pacific Coast; one hour's beautiful boat ride across picturesque Puget Sound. (5) Straits of Juan de Fuca. (6) Tacoma and Olympia.

You'll have spare time men during these three days, so take advantage of your opportunity and see some of these places of interest. Above all, don't forget us—Nov. 14th, 15 and 16th—and bring your plant men with you.

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION, Seattle, Washington.

FROM POWDER CASES TO ICE CREAM CANS

WHEN William Bradford Williams, author of "History of the Manufacture of Explosives for the World War" wrote his book on "Munitions Manufacture of the Philadelphia Ordnance District," he called attention to the fact that "the short period of seven months of concentrated effort of the Philadelphia Ordnance District represented an expenditure of energy,

Range Boiler.

Powder Container.

effort and capital equal to that required to build three Panama Canals."

Pennsylvania, with her vast steel mills, furnished the raw material and its manufacturers made it into munitions of war. It is interesting to know that the entry of the John Wood Manufacturing Company of Conshocken, Pa., in the ranks of the ice cream supply industry was the aftermath of the work accomplished for the government in the world war. It was a step frim powder cases, of which some 1,000,000 were welded for Uncle Sam in less than a year, to electric weld rivetless-solderless ice cream cans, with a possible production of 500,000 per year with present equipment.

Visitors to the Eastern Exhibition of Ice Cream Supply Men at the Elmwood Music Hall, Buffalo, N. Y., will therefore see one of the products which resulted from the change from war to peace activities. Years ago, more than half a century, this company commenced the manufacture of electric weld range boilers, expansion tanks, air brake tanks and containers for high and low pressure work. From 25 range boilers per day the production increased to 2,000 range boilers per day and the demand continues from all parts of the country. The welded range boiler and container had swept the country in popularity long before the war proved the value of welding in such huge tasks as repairing crankshafts and machinery which heretofore had been thought to be beyond repair, and discarded as junk.

It was only natural that when the war came to its sudden end that the John Wood officials looked over the field to see if something similar to the small welded powder container could not be made. The powder container was leak-proof, air proof and met the most rigid specifications of the war department. It was only natural that the ice cream can would come in for first thought.

About this time Walter H. Richman, who after many years of experience in the retinning and manufacturing of ice cream cans, developed the seamless, solderless ice cream can. It was the development of an idea. Mr. Richman knew by experience that an ice cream can, to be

sanitary as well as easily retinned, must be made without rivets and solder. In other words, it must be a tight, leak-proof as well as strong durable container built for many years of service.

In 1919 the plant started to manufacture the new type ice cream cans which proved a great success and now electric weld cans are in use in all sections of the country and have been specified as standard for use by the government because of the rivetless-solderless feature and the strong sturdy welded construction.

Ice cream manufacturers will realize how closely aligned the powder cans and ice cream cans are in the course of production as is shown in one paragraph of the story of "The Government's Largest Powder Container Plant" by W. B. Williams and many believe it will only be a matter of a few years before the same plant will be among "the world's largest ice cream can plant" just as this Pennsylvania corporation has earned its reputation "the largest range boiler manufacturers in the world".

Quoting from Mr. William's work on ordnance, he states: "In the manufacture of these cases, the steel sheets, just as they come from the rolling mills, each sheet approximately one-eighth of an inch thick, are sent direct to the trimming shears, where they are cut to the exact size and from there delivered to the sand blast, which, by means of sharp sand, forced under high pressure, all corrosion and scale were successfully removed from the ends of the sheets, in order that the electrical welding of the long horizontal seam might be effectively done. From the sand blast, the bending rolls form the plate in a cylinder shape, preparatory to the welding operation."

And quoting further from Mr. William's work, he states: "One happy sequal of the world war, indeed, is seen in the turnover which took place after the war work was shelved at the plant of the John Wood Mfg. Co. They figured that machinery which had made containers for explosives could be adapted to making an improved, seamless, tinned container for ice cream.

"Here again is seen the same versatility of American engineering and quick adaptation to the needs of the hour (as the marvels of American ingenuity had proven) that caused the kaiser to get Von Hindenburg on the long distance phone and make inquiries as to the possibilities of success, or failure, to hold back the Allies. Von Hindenburg "side-stepped" and, jealous of his job, sought to keep up the Kaiser's hope. How he was disappointed will very soon be read by the school children, in their study of the history of the United States of America."

The personnel of the John Wood Mfg Co. follows: Victor Mauck, chairman of the board of directors; Frank Sutcliffe, president; Herbert S. Mauck, vice-president; Morris H. Feldman, general manager of sales; Joseph Winter, works manager; H. Lee Koenig, assistant manager; Arthur Marland, superintendent; Walter H. Richman, manager of sales, ice cream can department; Joseph Montague, manager of sales, range boiler, tank and container department; George Hofstetter, Jr., manager of advertising.

The company will exhibit at Buffalo ice cream cans, ice cans, range boilers, powder containers and similar products.

A Heavy Heart

"I don't like your heart action," said the doctor applying his stethoscope. "You had some trouble with Angina pectoris, haven't you?"

"You're partly right, doc," answered the young man sheepishly. "Only that ain't her name."—Exchange.

Mister Leacer, Pali House, San Francisco:

Dere Friend, i got the valve with i by from you alrite, and wy fo gods sake doan you send me no handle. i lose to me my customer shure thing. You don treet me rite, is my money not so good as the other feller. I waste 10 dase and customer he holler for water like hell by the valve. You know he is hot summer now, and the wind she blow. the valve she got no handlem, so what the hell i goan do. U doan sen me the handle pretty quick i send her back and i goan order some valve from Krain companee. good-by, your fran,

ANTONIO SCLANA IODUTRA

Since i rite these letter i find the d--m handle in the bocks so you excuse me.

Do It Now

If with pleasure you are viewing any work a man is doing,
If you like him or you love him, tell him now;
Don't withhold your approbation till the parson makes ornation
As he lies with snowy lilies o'er his brow;
For, no matter how you shout it, he won't really care about it;
He won't know how many tear-drops you have shed;
If you think some praise is due him, now's the time to slip it to him,
For he cannot read his tombstone when he's dead!

More than fame and more than money is the comment kind and sunny
And the hearty, warm approval of a friend,
For it gives to life a savor, and it makes you stronger, braver,
And it gives you heart and spirit to the end;
If he earns your praise, bestow it; if you like him, let him know it:
Let the words of true encouragement be said;
Do not wait till life is over and he's underneath the clover,
For he cannot read his tombstone when he's dead!

—From "Dipped from the Stream"

It is to be hoped that all of the Dixie Flyer Boys will meet together in Atlanta, Ga., at the Southern Exhibition Nov. 28th-Dec. 2nd inclusive and there is no doubt that there will be a large attendance at this show from the information that I gather over my large territory of the South-west. Mr. Everett our efficient secretary of the Association of I. C. Supply Men is leaving no stone unturned to make it one of the greatest meets that was ever held south of the Mason-Dixon line.

And the ice cream manufacturers seem to be very enthusiastic over this meeting and its location and no doubt there will be a record breaking attendance of the ice cream manufacturers. So come one and all and let's put Atlanta on the map with this great show.

J. W. MULLIGAN.

* * *

Chicago, October 5th, 1921.

Your S. O. S. of October 1st finds me just as your letter suggests—getting ready for the Dairy Show—

ESTABLISHED 1879

but practically devoid of ideas along the line that you want.

You ask for comments, plans, pet peeves. With the Dairy Show right in front of us, the only thing I can plan on doing is to get my work done so I can get away. Haven't any pet peeves that I can see, and can only think of the nice things that have happened in the past at the different exhibitions that I am reminded of by referring to the list of associations on the margin of your stationery.

This list reminds me of the different conventions we have held and how we look forward each year to meeting the people we made friends with at the last convention.

Have you ever noticed the camaraderie and courtesy among the supply men attending these conventions? Generally speaking they all try to pull together to help each other with their exhibits and while there may be a little scramble at the end of the show to locate one's own hammer or handsaw, each man there is not only interested in his own work but will lend a hand to other exhibitors. The friendly associations and exchange of ideas that are made possible by these conventions and exhibits are a nice thing to see and to look forward to. As far as my plans are concerned, I intend to attend as many of these conventions as I possibly can.

Personally, I feel that the coming season is going to be a very good one. A number of new ice cream plants are being contemplated, which will require equipment. In addition to that the prices on equipment of all kinds has been reduced considerably, and an ice cream manufacturer who needs equipment should not hesitate about ordering for the coming year.

With kindest regards, and looking forward to meeting you again, I am,

Yours very truly,

A. R. SPONOR,

Sales Manager, Dealers' Dept., Solar-Sturges Mfg. Co.

* * *

HOSTETTERS CREED.

We sent Brother Hostetter (Wyandotte), our S. O. S. and he came to our relief—and generously. We hope he didn't miss his train.

"I am just ready to catch a train and I hardly know when in a hurry like this what to write you, you stated that you wanted it rushed and I presume that I should get it right out in today's mail.

"I want to say to begin with that great preparations are being made to take care of the Southern Ice Cream Manufacturers when they get here in November, and I believe that it is going to be a record convention for the ice cream men. I believe that they are going to derive a great deal of benefit by coming together at this time, as well as have some fun along besides. Atlanta, as you are probably aware is one of the greatest convention cities of the United States, they know how to take care of their guests, and there is one thing, our climate is so affable and wonderful that it is always a pleasure to come to Atlanta, wether it is in the summer or winter, and I believe that it is the general spirit of the people, whether they are ice cream men or what they are to always make visitors welcome, and I believe that the folks who are interested in the ice cream industry will find it to their interest to come to Atlanta, in November, regardless of the part of the world they are located in.

"I have just come back from a three months' trip

through the Republic of Mexico and Cuba, and these countries are certainly going to be wonderful fields some day for the ice cream industry. People in these countries do not entirely drink alcoholic beverages, they are very fond of ice cream and frozen dishes of all kinds, in fact, I think the excessive drinking is done by visitors from dry countries. The natives and the regular citizens of the Republic of Mexico and Cuba really do not drink excessively, but prefer soft drinks and frozen drinks, especially like sherbets and ice cream. I do not recall seeing one clean, modern plant on my entire trip. Cuba is ahead of Mexico, but, of course, Mexico is to be excused after having ten years of revolution. They are seen in most sections delivering milk for instance, on a burro's back, a can on either side and a man puts a dipper into it and pours out what you want. There is a great deal of can milk used, some goats milk is used also, lots of it, but when it comes to ice cream in that country there is going to be wonderful opportunities, and modern plants will be welcomed and there will be a big field for it, of course I do not know until recognition comes that it would be wise for anyone to invest money in Mexico, but it is the field that the ice cream man should investigate as soon as the Obregon government gets recognition, which all people seem to think that they will have.

"Regretting that I can not write you some more news, but I only have a short time in which to make my train, trusting to see many representatives of your periodical as well as many folks from Milwaukee, and the North down here for the convention in November, I am Sincerely yours,

C. P. HOSTETTER,

Dist. Mgr J. B. Ford Co., 219 Hurt Bldg., Atlanta, Ga.

COURAGE AND COMMON SENSE APPLIED TO ICE AND OTHER THINGS

By C. W. Esmond

Director of Service for the "Servants to the Dairy Industry"

A certain well known Canadian manufacturer had always put up natural ice for packing his cream up until 1921. As the winter of 1921 wore on without bringing an ice crop he interviewed an ice manufacturer about securing his season's supply. He found that the cost would be approximately $35,000. But he knew that even if he made a contract for this ice, he might have difficulty in getting enough to carry him through and he might be forced to pay a ruinously high premium to get the supply he needed.

Se he interviewed his banker regarding financial help in putting in an ice plant. Despite the obviously big saving that the putting in of such a plant would make, the banker would do nothing. He next got the representative of an ice machine company on the job, gave their proposition quick but careful consideration and gave them the order to go ahead and install a plant, he to pay a nominal cash payment and to pay the balance in instalments over an extended period.

The ice plant was installed and working before the busy season opened. It practically paid for itself during the summer and in September the owner was selling from $75 to $100 worth of ice per day, this being the amount he could produce in excess of his requirements.

If he had taken counsel of fear, the ice manufacturers of his city would have had $35,000 of his money and he would have had nothing tangible to show for it. By taking counsel of courage, he has a fine efficient ice plant good for many years of service, in addition to having handled a record-breaking gallonage in 1921 and giving his customers a thoroughly satisfactory icing service.

This instance is typical of the character of the man. Out of practically nothing he has developed the largest business in his city, a business that he owns in its entirety. So-called 'hard times' have just one effect on him. They cause him to be more enterprising and aggressive; to achieve a stronger hold on public good-will when competitors are assuring themselves that 'this isn't the time to push for business'. He believes that the time to push for business is 'all the time' and that the best time is when the trade in general has taken to its dug-outs. His success proves the efficacy of his methods.

* * *

TRY IT NOW IN MILWAUKEE.

A cold and dreary March day, a Dixie Flyer, still wearing "ear tabs" and "mittens" met up with Pete Miller and M. E. Cutner, at Little Rock, Arkansas. "Ice cream suits" and straw lids were their attractive toggery. They were headed toward Texas. The assumption is that these regular go-getters in their midsummer attire were eager to put over the idea to our good Texas friends that ice cream days and incidentally buying time had arrived.

Hats off to the Dixie Flyers for their effective application of the principle of suggestion in selling.

* * *

WHY EVERS TOOK TO WADING.

Ft. Morgan, Colo., (Just following the recent Pueblo flood)—Dear Wallace: Had a novel experience here. Arrived at 4:50 a. m. Town is two miles from U. P. station and water was up so high no wagon or auto could pass over the road. Old and decrepit as I am, I had to wade over knee deep for ¼ mile. Had to leave my grips behind and this morning had the pleasure of another early morning dip. The water was fine!

L. H. EVERS,

P. S.—No restaurant on U. P. side is another reason I took to the water.—An excerpt from Cherry Pickings, July 1, 1921.

* * *

Louisville, Ky., Oct. 3, 1921.

I was very much surprised today when I received your letter saying that we only had one letter for publication in the supply men's department. It seems to me that our great organization of traveling men have lost sight of the fact that your valuable journal offers us to get in touch with our customers over the entire United States. In fact, I feel that our success along the lines of our organization is largely due to your interest and the space allotted us whereby we may tell our joys and sorrows to the ice cream manufacturing customers. I look upon it as somewhat of a personal letter from each and every contributor to his prospective customer and feel that a great deal more interest should be taken

in this department, though we may be very busy. But a few minutes time, spent in jotting down items of interest will be of assistance to all interested. Now I hope that all or a large portion of our good men, for they are all capable, will contribute more freely in the future than they have in the past.

While the writer will not have the pleasure of attending the National Convention at Minneapolis due to business conditions in eastern territory, you can say to the boys that I am with them heart and soul in cooperation for the great event.

Speaking of the Atlanta Convention, we are going to make it a humdinger because old King Cotton is climbing in price. And if there is anything that makes the boys in the south feel good, it is to pick up the daily paper and see that cotton has advanced sharply, say from 30 to 60 points and it makes everybody feel good. From what I can gather regarding the business outlook the coming year will be one of the best that the south has seen for quite a while.

I have just had a communication from our national secretary, Roberts Everett. He is leaving no stone unturned for the absolute success of the meeting. And feel that fully 85% of the ice cream manufacturers of the southwest will be in attendance as well as many north of the Mason Dixon line who are interested in the manufacture of ice cream.

I speaking from a supplyman's standpoint I wish to say to any manufacturer who has never attended one of our southern association meetings, that if he will come down once and be with us we will show him such a good time that he will not miss any in the future. So here's hoping to meet all of my old friends and acquaintances as well as new ones. I am, yours truly,

J. W. MULLIGAN.

A BEAUTIFUL FOLDER

The Pacific Lunmber Company, 2099 McCormick Building, Chicago, has issued a beautifully illustrated folder emphasizing the many uses to which California Redwood is put.

The Pacific Lumber Company is the largest producer and distributor of Redwood in the country and an extensive advertising campaign is increasing the demand.

For certain products, either made wholly or in part of wood, Redwood has proved the ideal material, both in manufacturing processes and in service. Its advantages appeal to buyers of these specialties, among which are caskets, casket boxes, cigar boxes, candy and glace fruit boxes, incubators, brooders, ice cream cabinets, refrigerators, clothing boxes and chests, storage battery separators, kitchen cabinets, show cases and certain furniture items.

While all the qualities of Redwood are factors in its usefulness for manufactured specialties, its softness, fine texture, freedom from defects, minimum of warping and swelling, lightness of weight, freedom from odor, are considered most important by manufacturers who use Redwood.

Unusual resistance to wet or dry rot, fire retardant, minimum of swelling or shrinking, protection from acid and alkali solutions, lightness in weight, ample strength, clear, sound stock in needed widths and lengths, high insulating power, soft, workable texture, immunity from worm and insect destruction, excellent painting surface —these are Redwood qualities that determine its specification and use by engineers and industrial builders.

A man never really appreciates what it is to be alone in the world until his mother is dead.

Progress in Studying Causes of Sandy Ice Cream

Address of O. E. WILLIAMS, Dairy Manufacturing Specialist, U. S. Department of Agriculture, before National Association of Ice Cream Manufacturers, Minneapolis, Minn.

SANDY ice cream has given the ice cream manufacturers and dealers a great deal of trouble in recent years, and the growth of the industry may have been retarded considerably by this difficulty. For the benefit of those who may not be familiar with sandy ice cream, I will first explain the nature of it in a general way.

Ice cream is called sandy when it has something in it that resembles, to the sense of touch, very fine sand (hence the name), and which does not dissolve readily in the mouth. The kind and degree of sandiness varies. At times the sandy particles are coarse, and not very numerous, at other times they are exceedingly fine and numerous. The latter type is the kind of sandiness that is ordinarily met with, but both the large and the small particles cause the ice cream to be objectionable. When the particles exist in small numbers, they may not be very troublesome; on the other hand, when they exist in large quantities, the ice cream becomes decidedly unmarketable. Some manufacturers claim to have had hundreds of gallons of ice cream turn sandy before it has left the factory, but sandiness is usually found to occur in much smaller quantities of ice cream, after it is delivered to the dealers.

The irregularity in the size of the particles and in the occurrence of the trouble has been mystifying not only to the manufacturers but to many other men as well. To quote the words of two large progressive manufacturers, who have been in the business for a long time, one recently said: "For a while we thought sandiness was probably due to the fact that the cream was held in the hardening room for a longer period, but upon closer investigation, we discovered that that was not the cause, as samples that were held only a few days would turn sandy during the winter months, or between October 1 and April 1. I am just as far from having a definite solution as I ever was. It seems to come and go like a ghost in the night."

The other one said, "We got the professors from the colleges and took them into our own laboratories, and they took samples of our goods, and took them into their laboratories. We had eight weeks of that sandy condition, and it went just as it came, and we were no wiser after it left than we were before. We changed no conditions whatever."

Since the sandiness occurred without any apparent change in the kind and quality of the ingredients used, or change in the conditions of manufacturing, it has naturally been a puzzling matter. The origin of sandy ice cream , therefore, has been almost as bewildering to the manufacturer of ice cream as the causes of fishy flavors in butter have been to the creameryman.

The first time our attention was called to this difficulty was about eight years ago. That was a very bad case and as we did not hear any similar experience no investigations of an extended nature was made of it. Then about five years later we heard of several other cases of sandiness; consequently a preliminary investigation was started. This also consisted of superficial experiments. We soon found it necessary, however, to make a fundamental study of both the character and the causes of the so-called sand, and as we shall see, the results of this investigation have so far been positive as to identify and partially positive in regard to the causes.

Now the first question is, what is this sandy material? The answer is, milk sugar, or as it is technically caller, lactose. This fact has been definitely proven and explained by Mr. H. F. Zoller and myself in a recent article entitled, "Sandy Crystals in Ice Cream, their Separation and Identification," which appeared originally in the last number (August 15) of the Journal of Agricultural Research. A copy of this article from the Journal has been sent to all of the members of the National Association of Ice Cream Manufacturers, so I presume most of you are already informed about the identity of this sandy material.

Causes of Sandy Ice Cream.

The next question is, what causes the lactose crystals to appear in ice cream? This question is not easy to answer definitely, because there are many conditions on which it may depend. For instance, the amount of lactose in the mix; the amount of water present; the form in which the lactose exists; the presence of other solids; the temperature and its changes; and the time of holding, are all important conditions. There are also various theoretical factors that it may be necessary to take into consideration in determining the real cause of sandiness in ice cream.

So far, no one has secured sufficient data to show conclusively the significance of certain factors, such as the rate of freezing and the protein content on the crystallization of lactose in ice cream, or to tell what the physical constants of ice cream mixes of varying compositions are. In fact, the only work that can be taken into consideration, relative to the determination of physical constants, and bearing on the manufacture of ice cream, is that of Mr. S. C. Hudson. His results are published in the Journal of the American Chemical Society, volume 26, 1904, and volume 30, 1908. This work includes the determination of the freezing points, and the rate of crystallization, etc., of pure lactose solutions. Work is now being done on the freezing points of different ice cream mixes in two of our laboratories, and the results will soon be available. The fundamental causes of sandy ice cream can not be discussed, therefore, until we know more about these underlying principles.

From studying the conditions in a general way, however, we have found three major conditions to which sandy ice cream may frequently be attributed, namely, first, sandy condensed and evaporated milk; second, excessive lactose in the mixes; and third, fluctuation of temperatures, in the hardening rooms and cabinets.

In explaining these three general causes, it will be best to use the following outline of the general conditions studied:

1. The character of the milk products used in the manufacture of ice cream.

2. The composition of ice cream mixes and the methods of compounding.

3. The treatment of the mixes prior to freezing.

4. The degree and rate of freezing and hardening in the ice cream.

THOMAS W. DUNN COMPANY

248 Front Street, New York

5. The temperature at which the ice cream is held while being marketed.

6. The length of time the ice cream is held.

General Condition No. 1.

In the use of materials containing lactose crystals we find the easiest and simplest way to produce sandy ice cream. It is well known that condensed and evaporated milk are commonly used and that both of these products are often sandy. The sand or crystallized lactose found in condensed milk is about one-tenth as soluble as cane sugar, hence when milk of this character is used there is danger of the crystals of lactose not being completely dissolved, and if they are not completely dissolved a sandy ice cream is formed.

General Condition No. 2.

In the composition of the mix there is another very common source of sandiness—the excessive use of milk solids not fat. Most of us know that in a large number of factories there is very little attention given to standardizing, and that the methods of calculating and assembling the ingredients are often crude. This, of course, is one reason why a great deal of variation occurs in the texture and composition of ice cream. It is also a reason for ice cream becoming sandy. According to the results we obtained last winter, we found that ice cream subject to exposure, as most ice cream is during the process of marketing, should not exceed 5.85 per cent of lactose calculated on the entire mix. This is equivalent to about 11 per cent milk solids not fat. Naturally, therefore, in all cases where milk solids not fat are carelessly substituted for a considerable part of the fat there is likelihood of getting too much lactose in the mix, which under certain conditions may result in a sandy ice cream. The conditions favorable to this result are explained later. In many cases an unusual amount of lactose is secured by taking the sand from the bottom of a can or barrel of sandy condensed or evaporated milk; the result of this is bound to be a sandy ice cream. Under the best conditions it is possible to use 12 per cent of milk solids not fat, but greater quantities are sure to bring trouble. If there is any doubt about sandy ice cream being produced in this way, just try to keep ice cream containing say 13 per cent of milk solids not fat for a week or ten days in an ordinary ice cream cabinet, and see what happens.

General Condition No. 3.

Under the third heading, treatment of the mix prior to freezing, there is a condition that is very important, namely, pasteurization. As stated before, in utilizing sandy condensed and evaporated milk the ice cream will be sandy if the crystalized lactose is not all dissolved. This danger we find can be overcome if the ice cream mix is pasteurized to 145 degrees F., held and kept slowly agitated for 25 minutes.

General Condition No. 4.

The fourth condition, that is, the degree and rate of freezing and hardening the ice cream is something we know very little about. We have not had facilities in the Dairy Division to properly study the effect of rapid freezing and hardening on a large scale, but we have made a few experiments on a small scale, and find that rapid freezing of mixes having a high lactose content hastens the formation of lactose crystals.

General Condition No. 5.

The temperature at which the ice cream is held after it is once hardened is undoubtedly one cause of much of our sandy ice cream. In our preliminary experiments we soon found that heat shocking, or the raising and lowering of the temperature, was conducive to the crystalization of the lactose in ice cream. This is the condition that commonly occurs in ice cream cabinets and in some hardening rooms where the refrigeration is very irregular.

The following experiment will illustrate the effect of temperature variations:

Effect of Variation in Storage Temperatures Upon Three Ice Creams With Varying Lactose Content. Composition of Ice Cream.

Mix. No.	Fat	Milk Solids Sucrose	Milk Solids not fat	Gelatin	Total Solids	Water
	%	%	%	%	%	%
1	14	14	6	½	34½	65½
2	8	14	12	½	34½	65½
3	4	14	16	½	34½	65½

Degree of Sandiness Observed Under Different Temperature Variations.

Mix No.	Per Cent of Lactose in mix	Method of Storing for Four Days Hardening Room	Cabinet (Normal)	Cabinet (Abnormal)
3	8.85	Trace 0°—5° F.	Considerable 6°—10° F.	Very bad 6°—17° F.
1	3.33	None	None	Slight
2	6.65	None	Trace	Bad
3	8.85	Trace	Considerable	Very bad

The milk solids not fat in the above experiment were obtained from a good quality of evaporated milk. The ice cream was held in the same cabinet in duplicate quantities, one set of cans being taken out each day and the ice cream being allowed to warm up to 17 degrees F. prior to repacking with ice and salt. This experiment was made several times, with the same results each time. Whenever the temperature fluctuated the lactose crystals formed ,and increased in quantity and size with the percentage of lactose in the mix. This experiment also substantiates what was said about the composition of the ice cream mix.

General Condition No. 6.

Holding ice cream a long time, especially when subject to wide changes in temperature, has proven to be favorable to the formation of sandy ice cream. The time required to produce sand will vary with the concentration of the lactose in the mix and with the amount of changing in the temperature, or of heat shocking. This is illustrated by the large number of instances where the dealers who handle the least ice cream are usually the first to complain of having it sandy.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad. for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

The place and time of the annual convention and dairy show of the Michigan Allied Dairy Association will be Saginaw, Feb. 14-17, both inclusive, according to action taken at the meeting of the Association's convention and show committee which met in Lansing recently and consisting of Messrs. H. D. Wendt, chairman; M. L. Noon, R. F. Frary, C. J. W. Smith, R. J. Ellwanger and D. W. Shiel.

The convention and show, based upon plans which are now being developed by the committee, will without question be the largest and most extensive of its kind ever produced in Michigan. There will be a complete line of commercial exhibits of dairy machinery, supplies and appliances of all kinds. Educational exhibits by the Michigan Agricultural College and the State Department of Agriculture will be featured. A dairy campaign in Saginaw to run for a week or more and ending with the convention and show is contemplated. In this such agencies as the Farm Bureau, the schools, Saginaw Board of Trade, etc., will be co-operating, the purpose of which is to bring about a more complete appreciation of the value and essential features of milk and milk products.

The Saginaw Municipal Auditorium has been made available for the use of the association by the Saginaw Board of Trade and is a building ideally suited for the purpose in question. The following sub-committees who will work with Mr. Wendt, who will be the convention and show manager, are as follows:

Program—M. L. Noon, Jackson.
Finance—R. J. Ellwanger, Grand Rapids.
Floor—C. J. W. Smith, Detroit.
Publicity—R. F. Frary, Lapeer.
Reception and Banquet—D. W. Shiel, Hillsdale.

next convention and show to be held at Saginaw, Mich., February 14-17, 1922.

The wonderful and successful National Dairy Show for 1921 is over and the ice cream men are now turning their attentions to the Ice Cream Supply Men's Convention at Buffalo and Atlanta, and after that the different state conventions, and they will have plenty to do from now on to attend these conventions, and we trust, they will be well attended for the ice cream business is getting larger every year and every one who is connected with the business is looking forward for a larger volume of business for 1922.

The Michigan Convention to be held at Saginaw, Mich., February 14-17, 1922 should be a good one as the Dairy Boosters are going to help entertain those who attend it and they can do so when they decide to do so—so leave it to them. The entertainment committee is a live one and will look after their end of the convention.

* * *

The old pioneer Paterson Parchment Paper man, A. T. Pratt hasn't missed a convention of the National Dairy Show or the Ice Cream Convention since both were organized (we haven't either Alex). He wrote: "I am looking forward to meeting many of my old friends." And he wasn't disappointed for all the old friends were there 100% strong.

⚜

NORTHFIELD, MINN. CREAMERY TO PRODUCE ICE CREAM

Northfield, Minn. made ice cream will soon be on the market.

The Twin City Milk Producers' association has made arrangements for the installation of a complete modern outfit of machinery and equipment for the making of ice cream in the splendid new milk plant which it erected the past year and actual manufacturing operations will begin in the near future.

The association has also engaged a Mr. Pitts of St. Paul, who has had 15 years' experience in the making of ice cream, to take charge of this branch of its production. Mr. Pitts is a past master in the art of making ice cream, and he will be able to put on the market a product which will be fully equal to anything known to the trade today.

Arrangements have already been made for supply of all the Northfield ice cream retailers, also those of Farmington, Lakeville, Dennison, and many other surrounding Minnesota villages. Contracts have also been made with some of the Faribault retailers.

"Northfield is a big market for ice cream, and those in touch with the trade declare that not even in the Twin Cities is the public so exacting in its demand for quality ice cream as right in this city," says a Northfield paper. "The colleges are of course a large factor in the ice cream business and at college functions particularly large quantities of high grade brick ice cream are in demand.

"The manufacture of ice cream is known to be of the most profitable branches of the dairy industry, and in launching into it the Twin City Milk Producers' association will provide another outlet for milk supply of its territory that should help to increase the farmers' return for his milk.

"In the Twin Cities retailers have recently organized a co-operative company for the manufacture of ice cream, and but for this project the Twin City Milk Producers' association might have entered the Twin City ice cream market also. The association will, however, supply this co-operative plant with its milk and cream.

JACK RABBITS
ELWIN F. WEIL, Secretary
514 New York Life Bldg.,
Kansas City Missouri

Kansas City, Mo., October 5, 1921,

The recent conference held at Washington to consider the unemployment situation, gives out a statement that should be seriously considered by the ice cream industry:

KARL R. ZIMMER

"During the period of drastic economic readjustment, through which we are now passing, the continued efforts of anyone to profit beyond the requirements of safe business practice or economic consistency should be condemned. One of the important obstacles to a resumption of normal business activity will be removed as prices reach replacement values in terms of efficient production and distributing cost plus reasonable profit.

"We, therefore, strongly urge all manufacturers and wholesolers who may not yet have adopted this policy to do so, but it is essential to the success of these measures when put into effect that retail prices shall promptly and fairly reflect the price adjustment of the producer, manufacturer and the wholesaler."

It is safe to say that nearly every ice cream manufacturer during the past season has made substantial reductions in the price of ice cream to the dealers. And it is interesting to note how few of the dealers have passed on to the consumer the benefit of these reductions. In a few cases the writer has noted, I find reductions at as much as 25c per gallon to the dealer without any change whatever in the price of fountain drinks.

Some of the ice cream men have reduced prices merely because their trade demanded it. But on the other hand most of them, no doubt, entered voluntarily into the spirit of the times and reduced prices with a view of making ice cream available to a greater number of people, and consequently increasing the consumption.

Lower prices to the consumer undoubtedly will increase consumption, but when the manufacturer is expected to bear the entire burden without the cooperation of his dealers, who is it that benefits? I have known of a few instances where the manufacturer would demand that fountain prices would be reduced, and in these cases they were able to report increased sales.

Brother White Caps and Jack Rabbits can be of service to their customers by talking with the fountain men and asking why their prices are not reduced. Try and show them that there are more people who will pay 10c and 15c for a soda or sundae, than there will pay 20c or 25 c. We are not interfering with our customers' affairs when we do this. On the contrary we are making that man more susceptible to demands which are bound to come sooner or later from the manufacturer himself, unless fountain prices are reduced.

It seems to me that this subject should be discussed at the coming conventions, and it no doubt will be. In the meantime let we "servants to the ice cream industry" gather what information we can and pass it on to our customers.

Jack Rabbits should not fail to be in Kansas City for the Kansas Convention. Nothing is being overlooked to make your visit here pleasant and profitable. If the writer can be of service to any of you in making hotel reservations or by furnishing information, I shall be pleased to do so.

KARL R. ZIMMER,
Kansas City, Missouri.

KANSAS MEETING, DECEMBER 15 AND 16.

St. Louis, Mo., Oct. 6th, 1921.

Editor Ice Cream Review.

Dear Sir:—The annual meeting of the Kansas Association of Ice Cream Manufacturers will be held in Kansas City, Mo., December 15th and 16th, and although not definite as to headquarters hotel at this time, we believe it will be the Baltimore. You will get more definite advice as to this later.

In view of the fact that President Manley yielded to our request to transfer the meeting from Topeka to Kansas City, and in this way added to our comfort as to hotel facilities. I believe that the Jack Rabbits should attend this meeting in larger numbers than ever and come filled with the spirit of good-fellowship, and in other ways show our appreciation for the consideration shown us by the Kansas Directors.

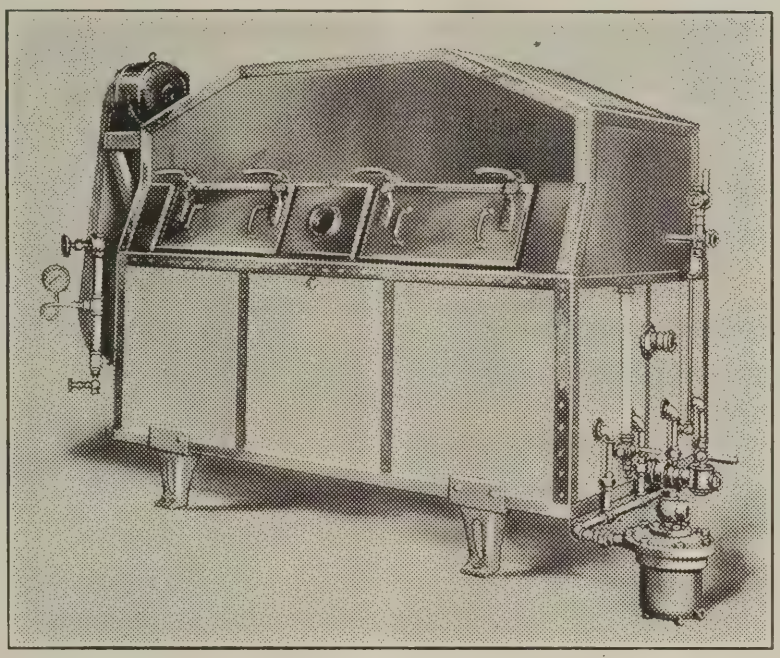
Those of you who were at Wichita last year know that we have got to go some to beat that convention, either in attendance, spirit of good-fellowship or entertainment.

Let's all try to make this next meeting bigger and better than ever, and appoint yourself a committee of one to help swell the attendance. Encourage the smaller manufacturers throughout the state to come, and tell them the meeting will not be complete without them. REMEMBER this in your calls, and also with personal correspondence, if necessary. Those who are not members of the Kansas Association of Ice Cream Manufacturers get them to sign up.

The ice cream manufacturers are not only co-operating with us supply men in the highest degree, but make our Association possible.

Boost for the Kansas Association, and keep at it.!

Yours very truly,



J. L. NELSON,
President.

IS ICE CREAM SHIPPED TO THE ORIENT?

Some time ago a Pennsylvania Newspaper published information to the effect that shipments of ice cream were being made to the orient in 500 gallon containers.

The Ice Cream Review has tried to obtain authenticity of this fact with the result of news received from several of the largest ice cream manufacturers on the Pacific Coast to the effect that no ice cream is being shipped from the coast in 500 gallon containers such as announced by the Pennsylvania newspaper. Transports, on ocean liners buy quantities of ice cream preparatory to trips to the orient. The ice cream is generally brick and is kept in cold storage boxes. San Francisco is said to have more business than either Seattle or Los Angeles, but the amount is not sufficient to attract particular attention.

STROUDSBURG, PA.

Sept. 10, 1921.

The Cream Production Company,
Port Huron, Mich.

Gentlemen:

Having used one of your Condensers for sometime, we are so well pleased with its merits and the product that it produces that we gladly recommend same to all that might be desirous of turning their skim and surplus milk into money.

At this time of the year we are using our whole milk and butter, and by condensing it slightly we get the finest mix, and the best ice cream ever produced.

We find that by using your Condenser that we are saving the money, you claimed we would.

Yours very truly,

Stroudsburg Creamery Co.

PORT HURON — *B. Trudell & Company, Montreal, Quebec Manufacturer and Jobber for Canada* — MICHIGAN

THE ASSOCIATION OF ICE CREAM SUPPLY MEN —A RECORD OF CONSTRUCTIVE WORK WELL DONE.

(Continued from page 12)

10—Simulating in one's own product the trade mark, trade name, cartons, slogans, advertising matter, or appearance of a competitor's product.

11—Converting raw materials of competitors to one's own use by diverting shipments through bribery, trickery or misrepresentation.

12—Depriving a competitor of transportation facilities through bribery of railroad employees, trickery, exercise of undue influence of any other means.

13—Refusal to accept advertising upon other than ethical grounds.

14—Threats to withdraw advertising unless competitor's advertising is excluded or unless certain discriminatory favors are granted.

15—Claiming or exercising a monopoly.

16—Obtaining estimates from competitors through bogus receipts by a third party.

17—Threats to withdraw patronage from a firm supplying raw materials if same raw materials are sold to competitors.

18—Bidding prices of raw materials to a point where business becomes unprofitable, for the purpose of driving out weaker competitors.

19—Purchasing a competitor's unusual goods, already sold, from a customer, and substituting one's own goods.

20—Threatening to force a competitor out of business unless he keeps out of certain territories.

21—Selling or offering to sell below cost or at less than a fair profit to force a competitor out of the field.

22—Making up and disseminating false cost sheets.

23—Payment of bonuses to jobbers' salesmen, with or without the knowledge of employers, for pushing of certain goods as against competitors' goods.

24—Giving away goods, other than customary samples, in large quantities to hamper and embarrass competitors.

25—Combinations of competitors to raise or maintain or bring about uniformity in prices, to divide territory or allot customers.

26—Offering goods through second hands for less than their direct sales price.

HARTIG WILL INCREASE CAPACITY.

The ice cream plant recently installed by William Hartig, in Watertown, Wis., has proved inadequate to the demands upon it and it was necessary to put in additional equipment so that the capacity of the plant would supply the demand. The present capacity is 500 gallons daily but within a week the demands reached over that amount.

For the betterment of the delivery service an up-to-date refrigerator has been added to the truck service, which will be a welcome innovation to dealers.—Watertown (Wis.) Times..

NEVADA WILL HAVE FINE NEW CREAMERY AND ICE CREAM FACTORY.

Following the campaign for increased dairying in Nevada, Iowa, and vicinity for the past several weeks by the Nevada Community Club, which has met with a marked interest by the farmers of the community, the launching of a large and modern creamery, cheese factory and ice cream concern is announced by A. Contri, a local business man.

Mr. Contri has purchased a large building in the business center of the city, known as the Boardman building, at one time the home of one of the largest egg and butter concerns west of Chicago, and has architects and dairy engineers working out plans for his establishment.

The building is 50x90, with a full basement and two stories above, all built for storage purposes and well adapted to being remodeled into an ideal plant for the purpose for which Mr. Contri has purchased it. Work will begin at once on the remodeling of the building and it is hoped to have the plant in operation by the early spring time.

When completed it will be one of the most complete plants of its kind in the state.

TO ERECT $100,000 MILK PLANT

Henry Gottselig, Ross Barley, B. M. Cramer, L. C. Gross and M. E. Keen, who have conducted dairy routes in the city of Lancaster, Pa., for a number of years, have been granted a charter for their corporation into the Lancaster Milk Products Co.

The object of this combination is to provide a milk service in Lancaster and will cover the distribution of grade A milk, together with Ideal buttermilk, and other dairy products, and to expand their service to include the production and distribution of Ideal ice cream.

For a building site the company has purchased the tract of land located at 623 to 633 Second street, for erection of a modern dairy and ice cream plant. The building when completed and equipped will represent an investment of $100,000.

A Diplomatic Refusal

First Boy—You're afraid to fight, that's what.

Second boy—No, I ain't, but if I fight you, my mother'll lick me.

First Boy—How'll she find out?

Second Boy—she'll see the doctor goin' to your house.—Edinburgh Scotsman.

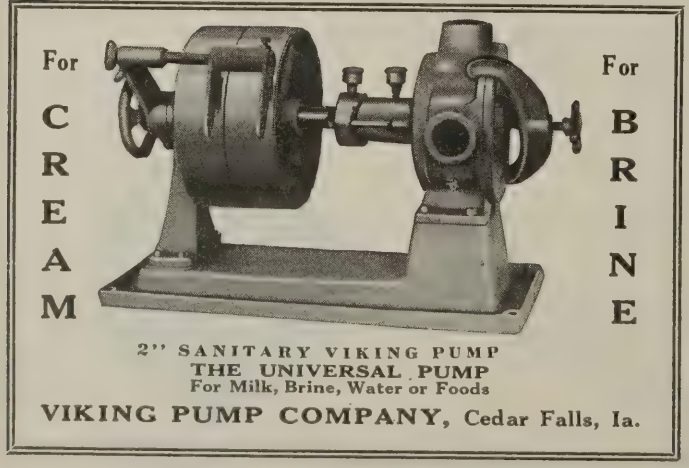
ICE CREAM CONVENTION BEST EVER.



The twenty-first annual convention of the National Association of Ice Cream Manufacturers will go down in the history of the association as one of the best, if not the very best, ever held. The attendance was fully up to expectations and the proceedings high class. In later issues we will publish these proceedings in full.

Officers were elected as follows:

Chas. G. Morris, New Haven, Conn., President.
Morden Neilson, Toronto, Ont., Vice-President.
N. Loewenstein, Chicago, Ill., Secretary.
W. J. Weller, Brooklyn, N. Y., Treasurer.

The convention was held in the Radisson Hotel, in Minneapolis, and the program was arranged to give visiting delegates an opportunity to see the sights of the Twin Cities and to visit the "World's Greatest Dairy Show." A complete list of exhibitors at the dairy show follows:

Abbott Laboratories, The, 4753 Ravenswood Ave., Chicago, Ill.
Anheuser-Busch Sales Corp., 2367 Logan Blvd., Chicago, Ill.
Anker-Holth Mfg. Co., Port Huron, Mich.
Atlantic Gelatine Co., Woburn, Mass.
A. H. Arnold & Bro., 308 So. Canal St., Chicago, Ill.
Atlantic Bottle Co., Inc., 90 W. Broadway, New York, N. Y.

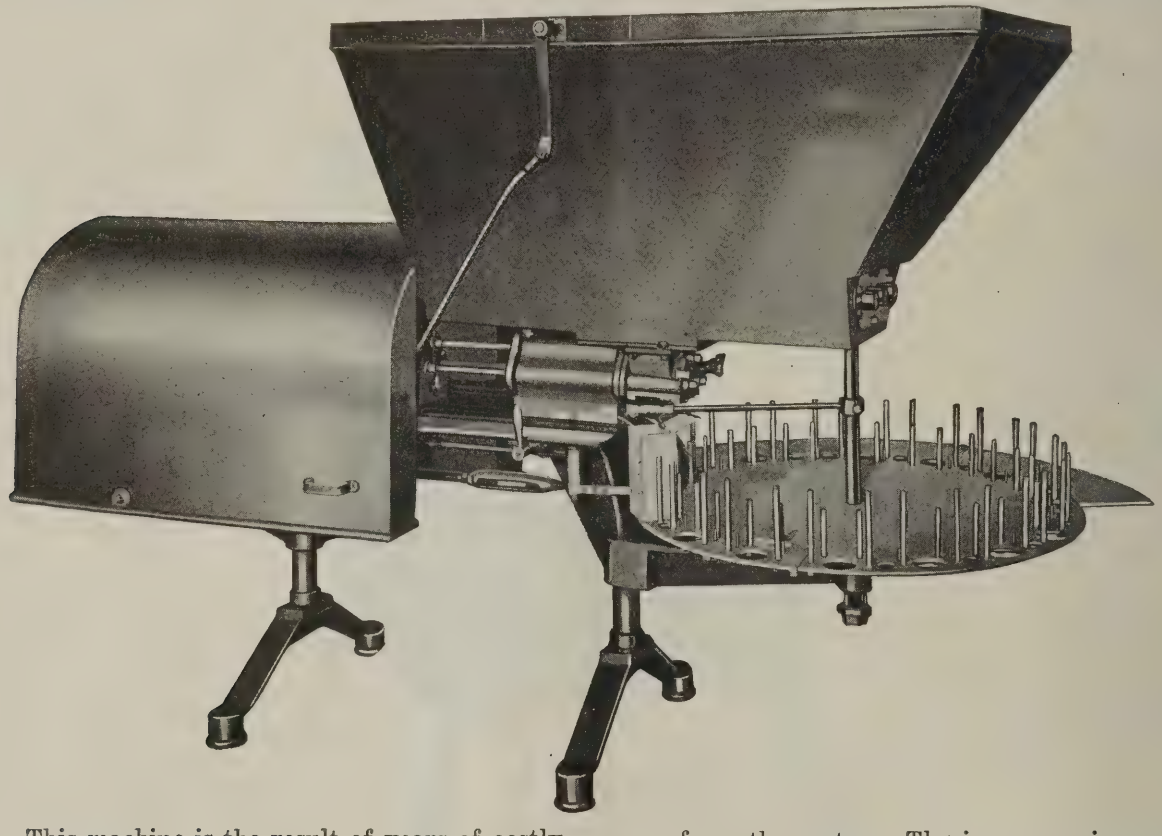
DETROIT, MICH. MARKETED THROUGH REGULAR VISCOLIZER JOBBERS CLEVELAND, OHIO



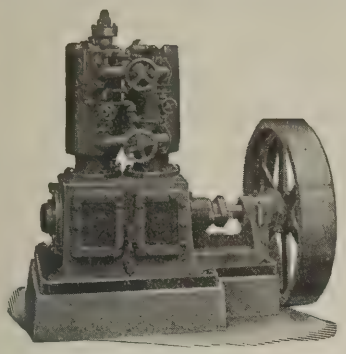
A New Era in Packaging Ice Cream

By TIMOTHY MOJONNIER, of Mojonnier Bros. Co., Chicago, Ill., before National Association of Ice Cream Manufacturers.

THE title to my paper was kindly assigned to me by Mr. Loewenstein. It is a pleasure to be able to discuss in the brief time alloted, a subject in which all the members of this influential association are keenly interested. The success of the ice cream industry is due in a large measure to the fact that in the past, new inventions of merit have been put into practice by the manufacturers as fast as their advantages were proved. This is the spirit that will continue to make the ice cream industry a great industry.

Ice Cream Packaging Machine.

The new era in packaging ice cream is made possible by the invention of the ice cream packaging machine which has been placed upon the market during the current year. This machine is the result of years of costly research and experimentation. The pioneer in this new art was Mr. E. J. Retzbach of St. Louis who spent many years, and the savings of a lifetime in the development of this idea, and to him was granted basic patents covering both the mechanical principles, and the process for packaging ice cream directly into the cartons.

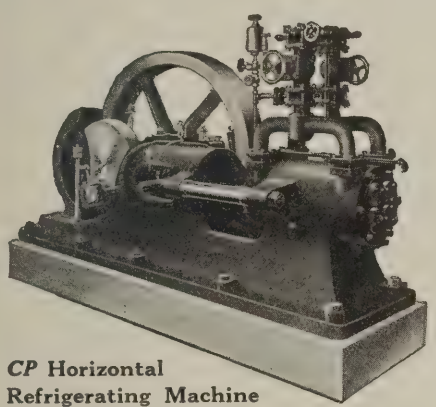


This new machine receives the ice cream just as it comes from the freezer, and while it is still in the plastic condition—packages it directly into the carton, one, two or three flavors at a time. The filled cartons are then transferred to the hardening room, and the ice cream is hardened in the carton, ready for delivery to the trade.

This machine operates entirely automatically. It can be located so that the contents of the freezers can be discharged directly into the three compartment hopper which is refrigerated and insulated, or the contents of the freezers can be discharged into suitable cans, and in turn, the cans be dumped into the respective compartments of the hopper.

From the hopper the ice cream passes through the machine, and into the cartons, in exact predetermined, measured amounts, of each flavor. The standard tuck-end type of carton is used. This is the type of carton now most commonly used, and it is the type that possesses the most advantages over all other types, both from the standpoint of the manufacturer and of the consumer. A parchment bag is inserted into the cartons before feeding the cartons into the machine. By experimentation and by consultation with a large number of manufacturers, we found that the use of the parchment bag was greatly desired. The majority of the manufacturers consulted, favored its use since this paralleled their present method of wrapping the hardened bricks in parchment liners. It helps to prevent leakage both at the time of filling, and at the time of removing the ice cream from the carton. The ice cream is more readily removed from the bag than from the bare carton. There is less slop and waste of ice cream, and but little muss upon the part of the consumer when cutting the brick. The practicability of this package was demonstrated in Chicago where it has been in constant use for several months by three of the leading ice cream plants. The plump, full measered brick has been complimented by both the dealer and the consumer.

After being filled by the packaging machine, the cartons are removed, inspected, sealed, transferred to the carry-out tray, and the tray removed to the hardening room. If so desired, the cartons can be passed through a tying machine after being filled. The brick molds now universally employed can be used to receive the cartons at the machine. The cartons are placed therein upon their ends. Other means can be used for handling the filled cartons. One used is meeting with fine success with a galvanized pan that holds thirty two quart cartons. In this pan the sides of the carton are well pressed in, and the bricks completely retain their square form while hardening. The bricks remain in the pan in the



CP Vertical
Refrigerating Machine

Pays for Itself in 3 Years

Then Pays Dividends

ALTHOUGH the greatest benefits that accrue from a *CP* Refrigerating System to its owner are the freedom from dependence on the ice man, the convenience of the system, the steady, dry temperature and the cleanliness of the *CP* System, it is a fact that will be vouched for by any owner of a *CP* System, that the savings it effects by eliminating the ice bill alone will pay completely for the outfit in three years or less. From that time on your expenses for refrigeration will be the smallest single expense you have.

CP Horizontal
Refrigerating Machine

CP Refrigerating Systems are made Vertical or Horizontal as desired in a complete variety of sizes ranging from 3-4 ton up. *CP* Refrigeration machines have several features which make them peculiarly well suited to the refrigeration of dairy products which are fully explained in booklet, "The Story of Refrigeration." Its yours for the asking. Send for it.

The Creamery Package Mfg. Company

hardening room until they are delivered to the wagons.

This machine will fill either pint or quart size cartons of the common brick type. By making a slight change, it can be made to fill half pint, pint or quart size carry-home pails. Likewise it can be modified to fill round cartons of various sizes.

The standard model is geared to deliver twenty quarts per minute, or 1,200 quarts per hour. This speed can be increased or decreased if desired. Its limit is governed by the ability of the operator to feed in the cartons, or by the output desired.

The standard model of this machine will fill any flavors of ice cream that have passed through the freezers. For example, strawberry, cherry, peach or any of the other common fruits ordinarily used to flavor ice cream, if whipped in the freezer with the ice cream, can in turn be filled with the packaging machine. Likewise it will fill with fine results, sherbets of the proper composition and overrun, along with ice cream.

Advantages From A Manufacturing Standpoint.

We have considered what the machine is, how it operates, and what it does. Let us now consider some of its advantages to the manufacturer. Under the old methods at least twelve operations are necessary in order to produce brick ice cream. Each operation requires labor, or as the engineer would state it, the expenditure of a given number of motions. The manufacturer pays for each of these motions.

By means of the packaging machine, the total number of operations is reduced from twelve to seven. The exact saving in labor that is effected by the new method, will vary with the output of the plant, and the manner in which the work is organized. Based upon one experience to date in one plant making an average of about 1,000 bricks per day, the services of at least two helpers were dispensed with. In a large plant making as many as 8,000 bricks per day, upon the authority of the superintendent, the number of help required to produce this quantity of brick ice cream was reduced from twenty-two by the old method to seven by the new method. As the new method of making ice cream bricks becomes better understood; and the necessary operations involved, better organized, it may become possible to make further reductions in help. In any plant, whether large or small, the eight following labor operations are dispensed with, under the new method. (1) Labor of pouring the ice cream into the molds. (2) Transferring the molds to the hardening room. (3) Removing the molds from the hardening room to the cutting room. (4) Dipping the molds in a hot water tank. (5) Removing the ice cream from the molds. (6) Cutting the slabs into bricks. (7) Wrapping the bricks in the parchment liner. (8) Inserting the hardened brick into the carton.

The packaging machine makes it possible to rout the brick ice cream through the plant, by the shortest and most direct lines, thus saving both time and labor.

Another advantage from a manufacturing standpoint is the saving in ice cream, that is effected by the new method. Under the old method there is usally a loss of ice cream while transferring from the freezer to the molds, due to slopping. There is a loss due to the fact that the molds are frequently oversize, to allow for cutting. There is a loss in cutting the slabs. Conceding upon a most conservative basis, the total loss to be five per cent, upon an output of 25,000 gallons of brick ice cream per year, this means an aggregate loss of 1,250 gallons of ice cream. It is therefore evident that one of the greatest possibilities by the new method from a manufacturing standpoint is the savings in ice cream

that it is possible to make. A saving, which under the old method, receives itself into a sheer loss.

Several other manufacturing advantages could be enumerated. There is a considerable saving in floor space, as against the old method. The new machine occupies about the same room as one 80 quart freezer. It will gradually replace other equipment now used for making bricks, such as molds with covers; tables for filling the molds, dipping and cutting equipment, and tables for wrapping and packing the bricks. This all constitutes capital investment upon which the manufacturer writes off depreciation and pays taxes and insurance. It saves nearly half the space now used in the hardening room for making bricks, since the space now used for hardening the ice cream in the molds can be utilized for hardening the ice cream in the cartons. At the same time, there is a saving in the expense of refrigeration. What this amounts to has not been accurately determined, but it is bound to be a considerable loss. The refrigeration now required to cool the molds and the mold covers can all be saved. The loss of refrigeration that results when the molds are transferred into the hardening room can all be saved. There is a loss in refrigeration every time the doors leading to the hardening room are opened. With the new method, the loss of refrigeration from this cause is easily cut in two. Where the practice is followed of hardening the successive layers of ice cream in the molds, the loss is directly proportional to the number of times that the molds are put in, and taken out of the hardening room.

In removing the ice cream from the molds, the layer next to the mold usually melts to a considerable extent. When the brick has been returned to the carton after cutting, this softened layer must be hardened again, and this is done at the expense of the refrigeration. The manufacturer can double his brick business in the space required under the old method, or he can do the same volume of business in half the space. A large saving in refrigeration is effected in either case.

Advantages From a Sales Standpoint.

We will now consider the advantages of the new method from the standpoint of its effect upon the sales of ice cream.

The question in your mind is: What is the effect upon the quality of ice cream to package it by this new way? The new machine operates best when the ice cream is of heavy viscosity when fed into the hopper. As every observing manufacturer knows, this is the condition that will produce the best ice cream—a product free from large water crystals, and therefore smooth to the taste.

Under the old method, the layer of softened ice cream next to the mold surfaces, usually hardens into a coarse, icy or grainy crust, causing the defect commonly known as icy bricks. This is caused by the fact that no air can be incorporated into the water drops while the bricks are being rehardened. Under the new method, this difficulty is entirely eliminated. The water crystals are all of uniform size throughout the brick. The product is most pleasing to the taste. The texture and smoothness of the product is unexcelled when the ice cream is filled directly into the carton, by means of the packaging machine, and besides this result is accomplished without any shrinkage in the volume of the brick.

By the new way, the exposure to the air of the ice cream is reduced to a minimum. Its contact with hot water is entirely eliminated. The ice cream is not touched by human hands, and its possible contamination by contact with the tables, and other equipment ordinarily used is entirely avoided. The good flavors are all sealed in. The possible bad flavors are all sealed out. These are all arguments upon which the manufacturer can capitalize in his advertising, and in his sales promotion.

Packaging Bulk Ice Cream.

Another advantage is the large possibility that the new method offers to package bulk ice cream for the dealer. You are all familiar with the present method of handling bulk ice cream by the dealer.

We made a canvass among all the leading dealers of Oak Park, Ill., and also among a considerable number of ice cream manufacturers, in order to get the viewpoint of all concerned, in this problem. This investigation disclosed the following facts:

(1) The consumer buys bulk ice cream in preference to brick ice cream for two principal reasons. First, he believes that bulk ice cream has better flavor and better texture than brick ice cream, and in many cases the single flavors are preferred, and the same are not always available in brick form. I believe you will agree with me that this view is largely a matter of prejudice or of opinion, granting that the brick ice cream is made with the same care as is used in the preparation of the bulk goods. Second, the consumer believes that in buying bulk ice cream, he receives more for his money even if he pays a premium of from 30 per cent to 40 per cent for the same volume of ice cream. This view is not always correct. When the ice cream in the can is frozen very hard, it is difficult to avoid air pockets when filling the pail, so that in this case the consumer may get considerable less than the amount that he bought. The quantity in the carton is under the control of the clerk who dishes out the ice cream. One clerk may serve more, another less than the given volume. When the ice cream in the can is soft, the consumer benefits, but

B-K
Bacili-Kill

Eliminates Chance

Don't fool yourself just because you get by occasionally without sterilization. To be sure of high quality **all** the time, keep bacteria down with B-K all the time.

The doctors and hospitals say that in warm weather both pasteurized and certified milk are often seriously contaminated.

The daily use of B-K on all equipment and in patrons' cans reduces the bacteria that would otherwise contaminate your product. This practice continued year in and year out will keep your quality uniformly high and pay you many times the cost of the B-K. It will help increase confidence in your product and satisfaction of your customers.

Ask us for information on improving the quality of your product.

— Quality Pays —

At all supply houses.

Economize by using B-K

Better Dairy and Food Products.

GENERAL LABORATORIES
MADISON, WISCONSIN
Sole Mfrs. B-K

this is done at the loss, and at the expense of the dealer. Ice cream in this conditioin is seldom entirely satisfactory to the consumer.

The average consumer expects only the volume, or the weight of any product which he may be buying. The satisfied consumer is the one who receives uniform quality—that is flavor, texture, body, food value and uniform weight or measure. In other words, equal value for his money at every purchase.

(2) The dealer sells bulk ice cream from necessity rather than from choice. He discourages its sale by placing a price of from 15 cents to 20 cents per quart over the price of brick. He states that even at the increased price, his bulk business shows him a loss. One large dealer in St. Louis reported a cash loss of $3.50 in the sale of 70 gallons of bulk ice cream in one day. This did not take into consideration the loss in wages and in overhead. Had this been packaged at the factory, and sold at 10 cents a quart profit, he would have realized a profit of $28.00 for the day. Sales are lost during the time consumed in filling the cartons. An expensive clerk, or the owner himself have to give their valuable time to this menial operation.

The dealers interviewed were unanimously of the opinion that the logical place to package bulk ice cream is in the ice cream factory. One large dealer in Oak Park even now has his bulk ice cream put up by hand at the factory, and he stated that he would buy his ice cream only from a factory that would package his bulk cream. The majority of them believed that if they sold only bulk ice cream packaged at the factory, that the consumer would accept it, and be satisfied. It might take avertising and some educational effort to bring the consumer to this viewpoint.

With one exception, al the dealers interviewed were of the opinion that the standard pint and quart cartons could be used instead of the present carry-home pail to package bulk ice cream. The dissenting dealer believed that the carry-home pail should be adhered to. It would be very obviously an advantage even to the dealer if he could standardize upon one or two sizes and shapes of cartons. One important advantage of the standard brick carton over the carry-home pail is the fact that the ice cream can be served in more even portions and in more pleasing form when packaged in the brick carton.

Every dealer interviewed recognized that bulk ice cream packaged at the factory meant to him an assured profit per package, and more time to devote to sales. Ice cream is a product that represents a quick turnover. As a rule, the dealer receives the cash for the ice cream before he has to pay the manufacturer's bill. He can therefore sell it upon a close margin, and still make a very satisfactory earning. By handling bulk ice cream packaged at the factory he can make more sales in a given time, and this reduce his help and increase his profits.

(3) The manufacturers interviewed were somewhat divided in their opinions. One group assumed the attitude: "What do we care if the dealer loses by giving over measure? This means more gallons for us". Upon close analysis, I believe the majority of you will agree with me that this viewpoint may lead to an erroneous conclusion. The whole fabric of commerce, and of human endeavor in its many branches is predicted upon the little word "profit". If the dealer cannot make a profit in selling bulk ice cream, eventually the manufacturers will feel the effects of it. The fact that the dealer is even now charging from 30 per cent to 40 per cent more for bulk than for brick ice cream, must reduce the sale of the bulk. Increase the price and decrease the demand; or decrease the price and increase the demand, are the economic rules that govern the world over.

The second group which included the majority of the manufacturers interviewed recognized great possibilities in packaging the bulk ice cream for their dealers. Their bulk ice cream like their brick ice cream would reach the consumer under their label. By means of the packaging machine the bulk ice cream could be packaged at but little if any additional expense over the cost of handling bulk ice cream in cans. The wear and tear upon the cans, the handling and washing of the same would largely offset the carton cost. Increasing the sale of packaged goods would decrease the unit cost thereof. By constructive advertising the consumer would soon learn that bulk ice cream packaged at the factory has the same quality as bulk cream from the dealer's cans. Advertising packaged bulk ice cream to sell at the same prices as brick ice cream would be bound to increase the consumers demand. To realize the best possibilities would require close cooperation between dealer and manufacturer. The dealer would have to be provided with a good brick cabinet, and the manufacturer would have to keep the dealer supplied with fresh stocks. But this would pay, and it would lead to greater ice cream sales.

The same problem has been encountered in nearly all other food industries. It seems but a few years since packaged oatmeal, packaged soda crackers, packaged nearly everything else were unknown. Likewise with nearly all kinds of dairy products. Selling to the consumer in packages or containers is now the rule. The old order has been reversed. The new era is offering equal opportunities to the ice cream manufacturer.

Benefits From Standardization.

Permit me in closing to refer to another advantage that will accrue to the ice cream manufacturer—namely the advantages that will result from standardization in one department of this great industry, provided advantage is taken of this possibility. Investigation has revealed the fact that there are many different sizes and shapes of ice cream bricks. Pints which equal eight packages to the gallon. Fifths—five to the gallon. Quarts four to the gallon. There is a wide range in the capacity of these various sizes. One gallon contains 231 cubic inches. Therefore one quart contains 57.75 cubic inches. By actual measurement quart cartons from different manufacturers ranged in size from 57.85 cubic inches to 65.11 cubic inches.

The shape was likewise found to vary greatly. We have the Eastern and the Western bricks that are nearly alike. We have the brick most commonly used in other sections, and then a considerable number of shapes in between. Besides all of these we have a wide range of shapes and sizes of carry-home pails.

Now permit me to suggest that if your honorable body would appoint a committee on standards to study this problem, and then in turn recommend and adopt certain standards, it would revert to the good of the entire industry. This plan has been followed in other branches of the dairy industry with marked success, and to the advantage of all concerned.

The new package machine can be adapted to fill a wide range of shapes and sizes. However, broad standards would make possible larger production of the same sizes of cartons, bags, carryout trays, brick cabinets and other accessories. This would mean cheaper prices and better satisfaction all along the line. It would help to insure better deliveries, It would make it possible for manufacturers to interchange stocks.

So in concluding let me repeat that this new invention offers great possibilities to the ice cream manufacturer, to effect large economies in manufacture, and at the same time to greatly increase his sales.

Yes Sir, We'll Be There

By L. H. PAYNE, President, The Stout Crate Co., Milwaukee, Wis.

The trade that knows us personally need not be told that they will meet us at the Buffalo Show. They know we will be there because we are regular fellows and appreciate the opportunity for that more "spiritual," man-to-man contact with other regular fellows which such an occasion affords.

And so I feel when I board the train to attend such an occasion that I am stepping out of myself as it were to approach a new set of experiences with an open mind looking forward to the renewing of old acquaintances and to probably a better appreciation of the real "mind" of some other fellow who like myself has been immersed in the immediate problems of "daily making good" on other occasions when I may have met him burdened with the business cares of office or plant.

Stout Crate Company Exhibit at the 1921 National Dairy Show.

It is a good thing to get away from our places of business now and then—away from our respective establishments where our thoughts are prone to be turned too intently inward on the immediate daily problems that tease and beat us about, to meet the men we are accustomed to meeting only in that atmosphere on a footing more of human interest, less of personal selfishness.

I believe that the human elements I have suggested are alone sufficient to warrant the holding of these shows—but when one considers the material side in addition, one cannot escape the conclusion that in order to be up to date on the rapid movements of events in our chosen field, it is necessary to emerge from one's shell and survey the evidences of progress which such an exhibition brings in concrete, co-ordinated form.

As our contribution to this demonstration, we shall exhibit our augmented line of Stout-Schrooeder Perfection Cabinets and Stout Tubs—taking real pride and pleasure in explaining their features, into the perfection of which we constantly put our best thought and studied deductions from our close observation of the needs of those for whose service our product must be consistently adapted.

SOMEBODY SPILLED THE BEANS.

I have one little news item which I think will bear publication. I find our friend Hauk has advised the Wolf Hounds that the Chief of Police, our friend Glitsch, could furnish plenty of "wet" goods. I do not know whether it was due to the fact of this publication that the mayor of Oklahoma City asked for his resignation or not, but nevertheless the same is true. I see further that the mayor has rounded up the source of supply.

Jim Nelson, Bill Carpenter, Bulger and myself attended a meeting in St. Louis the other day taking up the subject referred to in this article. Thank goodness that the Sunday School which I attend does not read the Ice Cream Review. We intend to hold an indignation meeting in Minneapolis in which there will be a committee appointed to look after our friend Hauk.

Business has been very good in Texas and Oklahoma.

Instead of carrying "African golf balls" now, I notice that many of the boys are carrying "put and take" tops. Personally, I can say that you can put a plenty in; the top which I was introduced to had no "takes" on it for me.

Pleased to report that Buckner, champion of this district, is figuring on coming to Texas, and I understand that he has blood in his eye.

With kindest regards to all, and hoping that I will see you in Minneapolis, I remain,

Very truly yours,

F. J. PEALE.

* * *

Wolf-Hounds, Look and Remember.

That on December 12, 13 and 14, 1921, at Huckins Hotel, Oklahoma City, Okla., the Hounds will meet in convention with the Oklahoma Ice Cream Manufacturers in the biggest and most instructive meetings ever held by this growing, hustling body of business men, to thrash out the many big problems that are before them, and to pave the way for the most prosperous season of 1922. The outlook for this one great young state of Oklahoma is most encouraging. Oil has advanced in the past two weeks, with prospects of further advances shortly. Cotton has also advanced, and with these two staples up and going nothing can hold Oklahoma back from business prosperity, these conditions put a big smile on the ice cream men's faces, thus insuring big times ahead for the Hounds. So make ready, boys. Be here at the convention, ready for the time of your young lives. This goes for the ice cream men too. Our arrangements for the entertainment are about completed, and believe me, fellows, Hanks and the writer assure you that this year will surpass any show that we have ever put on. It is some big undertaking, but watch the Wolf Hounds go.

By the way, just one year ago tonight the youngest Wolf Hound in the world was given to us by our Great Heavenly Father, the little fellow has taken possession of our hearts and home, and the way he gets about and tries to talk, I am sure he will some day carry the grip, learn to play African golf, and the many other amusements of his brother Wolf Hounds.

Don't forget to wire, or write me for rooms for the convention, Dec. 12, 13 and 14. I will be glad to make reservations for all.

Mrs. Hauk joins Benj. and self in extending best wishes to all. Trusting to have your presence at convention, I am, Yours very truly,

C. R. HAUK, President.

* * *

J. S. May of the Blanke Baer Extract Company, St. Louis, Mo., wishes that he had been born triplets so that he could attend all the conventions that his firm would like to have him attend. He sends the following message to his friends who attend the conventions which he is unable to attend: "I'll be with you in the spirits (spirit, I mean)."

Mr. May has just returned from a three months' trip through California, Washington and Oregon and reports that business is picking up fine.

* * *

Shreveport, La., Oct. 10, 1921.

Business in general through Louisiana, Texas and New Mexico has been very good and the trade is also again booking futures which, of course, means only one thing, and that is we are over the desert and again on the business train full of steam and headed for a successful closing of the year 1921. Will see you at Fort Worth, Texas, December 7, 8 and 9.

Yours for success,

W. L. CASTLE.

ASSOCIATION OF ICE CREAM MANUFACTURERS OF PENNSYLVANIA.

To All Members:

There will gather in Erie, Pa., on October 31st and November 1st, 1921, for the purpose of exchanging ideas, a BUNCH of good fellows who's heart and soul are in their industry — Ice Cream.

Are you going to be one of that bunch?

The idea of having a set program, with the usual prepared papers on various topics, will be eliminated this year. Open discussion will be in order.

Bring along a list of subjects you would like information upon and see if there is not some one present who can and is willing to interchange ideas with you.

This will be your convention and it will be just as good as you help to make it.

"He Profits Most Who Serves the Best."

Do not come with the idea that you are going on a Joy Party, because the Erie boys are going to see that you have a good time, but come with the idea that you are going to get help and give help and that your going to do all you can to help make this fifteenth annual convention at Erie the BEST EVER.

Frank Biers of the Erie County Milk Association says that the calls for hotel reservations are coming in fine, so get in line and write Frank to make your reservation.

The Lawrence Hotel will be our headquarters. The date October 31st and November 1st. Last, but not least, the evening train to Buffalo, where the Association of Ice Cream Supply Men will hold their Eastern Exhibit from October 31st to November 5th, inclusive.

We welcome any one interested in the ice cream industry to meet with us.

ROBERT CRANE, President. J. W. NEUMAN, Secretary.

Big Southern Show will follow Buffalo Exhibition

WHILE the attention of the twenty-five or more states and of Canada is fixed on the big Eastern Exhibition of The Association of Ice Cream Supply Men which opens the last day of this month the ice cream men of almost as extensive a section have their eyes turned with just as much interest toward Atlanta, to be the scene of a southern exhibition from November 28th to December 2nd inclusive.

This southern exhibition will be practically as large and comprehensive as the eastern exhibition and will be under the same management. It is to be held in the service of the ice cream industry of the entire south and will be inspected by ice cream manufacturers of at least twenty states in the south and southwest.

Held in conjunction with it will be the annual conventions of the Southern Association of Ice Cream Manufacturers, the North Carolina Association of Ice Cream Manufacturers and the Tri-State Association of Ice Cream Manufacturers of South Carolina, Alabama and Georgia.

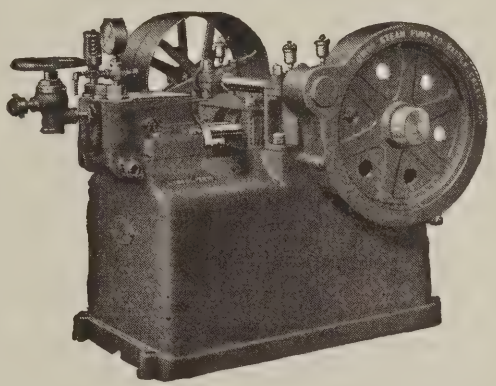
So, while the ice cream manufacturers of the Northern half of the country are packing their grips for Buffalo, beautiful, hustling, sunny Atlanta is preparing her welcome to be extended a month later to ice cream manufacturers from all the region where the sun shines brightest—and Atlanta is a real welcomer.

Atlanta is the capitol of Georgia and County of Fulton with a population of 250,000 and is the "Metropolis of the Southeast". Its climate is excellent, being situated 1,050 feet above sea level at the foothills of the Blue Ridge Mountains with an average temperature of 61 degrees, and the normal temperature in June being 76, July 79, August 77 degrees.

Atlanta is easily reached from all points east of the Mississippi River in an over night ride, and enjoys liberal stop-over privileges on both winter tourist tickets. Atlanta has ample hotel accommodation, having forty-four hotels with over three hundred rooms with numerous restaurants. Atlanta has the great Auditorium Armory, with a stage which accommodates yearly the elaborate setting for the Metropolitan Grand Opera and whose main room has a seating capacity for 8,000 people without crowding. There are, besides, various convention halls and committee rooms which are furnished for conventions. Atlanta is the financial center and central distribution point for commodities of the Southeast, the home of the Federal Reserve Bank, and of twenty banks and trust companies. It also is the headquarters for all government activities for the Southeast. It is the second largest Mule market in the world and the automobile center of the South.

Atlanta has 116 educational institutions, 272 churches including over twenty denominations. It has eighteen public parks and playgrounds. It has the largest ostrich farm east of the Rocky Mountains, open year around, with over 100 birds. It has an aeroplane landing field, a Robert Burns cottage—the exact replica of the famous poet's in Scotland. It has some of the most beautiful automobile roads in America, a zoo, historic battlefields, and Stone Mountain, the largest solid rock in the world, sixteen miles east of Atlanta, reached by trolley cars every hour.

The Southeastern Fair, one of the largest and best agricultural shows of live stock exhibits in the country, is held yearly at a permanent home in Atlanta.



Atlanta has twenty or more buildings of the sky-scraper class and more are to be built soon. It has more than 500 factories turning out over 1,000 different

Complete Outfitters to the Dairy Industry

articles valued at $175,000,000 a year. Some of the other country-wide known features of Atlanta are:

Cyclorama in Grant Park, the only remaining picture of the Civil war. This mammoth painting of the Battle of Atlanta weighs nine tons, being four hundred feet around and fifty feet high.

Fort McPherson, Camp Jessup and Camp Gordon, the government army posts. Fort McPherson has a large and most complete government hospital; Camp Jessup the largest and best government mechanical repair shops, and Camp Gordon is one of the largest army reservations and training stations east of the Mississippi.

The famous Chattahoochee river, the source of Atlanta's water supply.

The Confederate Soldier Home, an institution operated by the state of Georgia for the Confederate veterans.

The Georgia School of Technology, one of the units of the state system of colleges and a government headquarters for teaching aeronautics; Oglethorpe University, a college of "before the war"; Agnes Scott, a college for young ladies and one of the south's foremost women colleges; Emory University of the Methodist Church of the South; and leading medical and scientific colleges.

Atlanta also has the distinction of being an athletic center and of being known as the Golf City of Dixie. Its six great golf courses are known the country over. From Atlanta come those three widely known golfers, Miss Alexa Stirling, national woman champion; Bobbie Jones and Perry Adair.

DIXIE FLYERS, GIVE THIS YOUR ATTENTION.

Birmingham, Ala., Oct. 8, 1921.

Editorial Department,
Ice Cream Review,
Milwaukee, Wis.

Dear Sirs:—I have your favor of the 1st. Note everything you write, and in every detail you are correct.

Yes, I am busy; have been on the go since August 1st trying to cover the territory which, as you know, is some territory, but I am not so busy but what I can, and will, with a good deal of pleasure answer your very kind letter.

The most important matter which is before us from now until the end of 1921 will be the various conventions of the ice cream manufacturers. The one which stands out most interestingly for this section of the country naturally is the Southern Exhibit, in connection with the Southern Convention, to be held in Atlanta, Ga., Nov. 28 to Dec. 3. This meeting will be a great outpouring of the ice cream men from all over the South and the southwest, the exhibits which will be put on by the Association of Ice Cream Supply Men will mean much to the southern ice cream manufacturers, and judging from the response which I have personaly received from these men all over the South and Southwest I know the record for attendance at an exhibit of this nature will be shattered.

ICE CREAM BRICK CUTTERS and CABINETS

Write for Circular and Prices

C. E. PHENICIE

111 East 34th Street TACOMA, WASH.

I have had assurance from the Texas ice cream manufacturers to attend. They will come to Atlanta in special car, and quite a number will be there from Oklahoma and Kansas.

It is a physical impossibility for the Secretary of the Dixie Flyers to get in touch with each individual member, therefore I, as the President of this body, wish to get a message to each of the boys at this time, and there is no better way to do this than through The Ice Cream Review.

It is the desire of the officers and the entertainment committee of the Dixie Flyers to get all matters so arranged before the Atlanta meeting that each and every detail will be perfect, the boys' time will be taken up during the day with the work which always goes with an exhibit of this kind, and as we now have plenty of time for the detail work, and have been assured by the Association of Ice Cream Supply Men that certain evenings and afternoons will be turned over to the Dixie Flyers we can work with more intelligence, and get our program in shape.

In order to have this done right it will be necessary for the members of the Dixie Flyers to mail to our Secretary, T. J. Stewart, Mercantile Library Bldg., Cincinnati, Ohio, a check for their dues, amounting to $10. In this way he can meet the bills which the Entertainment Committee will contract for the entertainment of the ice cream men and ladies in attendance. It will also take a great deal of responsibility on the part of the individual members of the Dixie Flyers as to how best to entertain his friends who will be there from all over the South.

A tentative program has been drawn up, but up to date nothing definite has been done, but we can assure every member of the Dixie Flyers that what the Entertainment Committee will put over will be a credit to each of the members.

We have a number of real live fellows in this organization, a lot of fellows with mighty good ideas, and as the Dixie Flyers is not a one-man, or a half a dozen men, organization, but one of many, and each and every member with the same idea in mind of making the Atlanta and Southern Association meeting a howling success, I feel it behooves each member to do his bit. Write the Secretary or myself, with suggestions; help us to get the best and the most for the money which you are spending. It is your money, it is your organization, it is your show, and it will be **your fault** if it is not a success. You will not have reason to blame others. No individual member can be blamed. Get busy now, and do not wait until it is time to go to Atlanta.

We have a good entertainment committee. They are willing workers, and nothing will be too tough for them to tackle, but at the same time you must remember they are like yourself, working every day among the ice cream manufacturers, selling them goods, but I have the assurance from them that they will take the time to get up a program which will be a credit to the Dixie Flyers, and you all know what that will have to be.

Your President has spoken—get busy. Mail your check to Tom Stewart. Send in any suggestion you may have in mind, and, above all, get in behind your ice cream men and see that they have their reservations in for accommodations at the hotels. Do not let them pass up the BIGGEST and BEST SHOW ever pulled in the SOUTHLAND.

P. N. MILLER, JR.
President Dixie Flyers.

Large New Catalog Coming

For Milk Dealers, Ice Cream Makers and Creamery Men

DURING the last year our General Advertising Department has been building a large comprehensive catalog in loose-leaf form. This is being used throughout our entire organization with such success that we have decided to issue it in book form about the first of January, 1922.

It will include more than three hundred pages of photographs-drawings, information and prices. It will show many pictures of Davis, Watkins Equipment in actual operation in milk plants, ice cream factories and creameries. It will illustrate and describe in detail the many machines constructed in our several factories. Also information as to how the most progressive men in the Dairy Industry do the work at low cost of operation.

This is a period of retrenchment. Not in the building of new plants, nor the purchasing of new machinery; but, in doing those things which must permit a reduction in the money spent in operating the "spread." Handling costs must come down. You can do this only in one way—by equipping and routing the work so as to shorten up the distance between cost and selling price.

That is what this NEW CATALOG is for—to help you plan your work; and handle it at low cost. To show you the modern automatic equipment which will handle your work at much less cost for labor, time and losses. To guide your selection of the machinery best fitted for your needs. To show you just how well equipped we are to give you a a SERVICE worth more than it costs.

We are now making up the mailing list for this NEW CATALOG. We want to know how many to print. If you think you can make good use of this book, write us on a postal card, or in a letter "Put my name down for NEW CATALOG"—sign your name, name of company, and address; and mail it to

NOVEMBER 1921

IN THIS issue we devote considerable space to the Southern Exhibition to be held in Atlanta, Georgia, and to the different association meetings held during the same week, in connection with it. The Southern Association of Ice Cream Manufacturers and the North Carolina Ice Cream Manufacturers hold their annual conventions in Atlanta during the exposition. Following will be the conventions of the Texas Ice Cream Manufacturers Association in Fort Worth on Dec. 7, 8 and 9, the Oklahoma Association of Ice Cream Manufacturers in Oklahoma City on Dec. 12, 13 and 14, and the Kansas Association of Ice Cream Manufacturers in Kansas City Dec. 15 and 16.

Affiliated with these different associations are The Dixie Flyers, The National Order of White Caps, The Texas Supply Mens' Association, The Oklahoma Wolf Hounds and The Kansas Jack Rabbits. These organizations, made up of the men who furnish the ice cream industry with supplies, help to make the conventions successful and are appreciated at the full worth. We are giving space to the likenesses of many of these men. Some are too modest to furnish us with their photographs while others have alibis of one kind or another.

The Ice Cream Review, as official organ of these various organizations, feels a keen sense of duty in an effort to contribute something to their success. The officers have given us splendid co-operation in our attempt to make this issue of particular interest to the men who have their reservations made for these different meetings and we owe them our sincere thanks.

And "the boys on the road!" We don't know how we would get along without them. They have not only "adopted" The Ice Cream Review through their organization, but each one has adopted it personally and are evidencing a paternal interest in their offspring which has made the paper what it is today—the youngest but largest of its kind.

The various organizations mentioned above represent a territory which has, perhaps, shown a greater development along ice cream manufacturing lines than any other section of the country. This, too, in spite of the fact that the problem of a suitable supply of raw materials has always been a perplexing one. While we have never considered the ice cream industry of the country by sections we have always felt a peculiar interest in this particular part of the country where ice cream manufacturers have had so much to contend with. We have kept in close touch with their problems and we have watched the rapid development of the industry in that section with interest and pleasure. The men who put the business across in that great section are among the country's biggest and best ice cream men. We make our best bow to them and felicitate them upon their success. The Review will be represented by one of us at Atlanta and by the other at Fort Worth, Oklahoma City and Kansas City. We are looking forward to a good time with a bunch of good folks.

WE HEAR many complaints to the effect that collections are slow in the ice cream business. Dealers in supplies report that never before have they had so much money "on the books."

We are wondering why this situation prevails. Who has the money? Is the retailer holding out on the ice cream manufacturer or is the latter doing business on the supply dealer's money? If it is a problem of "button, button, who has the button?" then it would seem wise to locate said button and get it into circulation.

The ice cream business should be a cash business all along the line. A highly perishable product is involved and manufacturers and dealers in other perishable products work on a cash basis only. There is no good reason why the ice cream business should be an exception.

We have always understood that the retailer pays cash for his ice cream. If we are right then he must be absolved from all blame for tardy collections. If the ice cream manufacturer is getting cash for his prod-

uct he ought to be prompt in paying his bills. Safety if nothing else should prompt him to pay bills when due. If he is not getting cash from the retailer he should take steps to get it. The retailer certainly gets the cash and he gets it within a few hours after he gets the product.

Possibly the supply man can change his methods of doing business so as to correct conditions. If he is not making it an object to the ice cream manufacturer to pay bills promptly perhaps he should do so. Establishing a cash discount on bills paid within a certain period of time has put many a business on a cash basis and made conditions better for all concerned.

The practice of permitting overdue accounts to drag along month after month is bad for any business. The ice cream industry cannot reach its proper development unless good business practices find favor among the men who are interested in the industry. Come on men, let's get the dollars in circulation and let them pay one another's overdue accounts.

⚜

THE folks who attended the Eastern Exposition put on by the Association of Ice Cream Supply Men in Buffalo a few days ago, had a good time. In the first place there were plenty of their kind to meet them, then too they were pleasantly surprised by the number and excellence of the exhibits. One could not fail to be impressed by the evidences of progress along ice cream manufacturing lines. The story of the wonderful advancement in the industry could not be told so well in words. The Buffalo Show goes down in history as the greatest of its kind.

⚜

WE ARE in a quandry. We have been going along month after month and year after year harboring the thought that ice cream manufacturers, as a class, are progressive, big minded business men. We want to keep on thinking so, but we are all upset.

A man who should know what he is talking about told us the other day that the ice cream men of this country could never get very far until they learned to pull together. And here we thought all the time that they were pulling together. He claims that as a class they are inclined to go it alone and are so fearful of competition that they will not travel in harness.

We know, of course, that this man is mistaken in his conclusion, at least it is not fair to condemn a class on account of the short comings of some individuals. But he is no doubt correct in his analysis of the attitude of some ice cream manufacturers. This man has raised an important question and we are wondering what percentage of the entire membership he is describing. How many are pulling back while the others are pushing ahead to dignify and promote the ice cream industry? The different associations of ice cream manufacturers are carrying on a work which is in direct contrast with the element which would go it alone. United effort is the object of these associations.

It does us good to get a jolt occasionally. This man has set us thinking about the lack of co-operation that exists in the business. We hope it is not as serious as he paints it, but it is probably serious enough to merit the attention of every man who has the best interests of the ice cream industry at heart. Let us all do everything we can, by word and by deed, to show the man who is pulling back that if the industry is to develop as it should he must help push.

⚜

GET your local newspaperman boosting ice cream, and you have won half your battle for a bigger winter gallonage. He can do you more good or he can do you more harm than any man in your town, and it pays to make friends with that kind of a fellow.

Association of Ice Cream Manufacturers of New York State—Fourteenth Annual Convention, Arlington Hotel, Binghampton, N. Y., Nov. 30, Dec. 1, 1921. A. M. Le Messurier, Box 676, Syracuse, N. Y., Secretary.

National Association of Practical Refrigerating Engineers—Twelfth Annual Convention, Hotel Lorraine, Philadelphia, Pa., November 30, December 1, 2, 3, 1921. Edward H. Fox. 5707 West Lake St., Chicago. Secretary.

California and Southwestern States Ice Cream Manufacturers' Association—Annual Convention in connection with Pacific Slope Dairy Products Show, Armory Building, Stockton, Calif., Dec. 5-6, 1921. Robert J. Dryden, The Dryden Corporation, Oakland, Calif., Secretary.

Pacific Slope Dairy Products Show, California State Armory, Stockton, Calif., December 5-11, 1921. L. Diamond, Manager, Stockton, Calif.

Illinois Association of Ice Cream Manufacturers, Twenty-second Annual Convention, Hotel Sherman, Chicago, Ill., Dec. 6-7, 1921. N. Loewenstein, Secretary, 155 No. Clark St., Chicago, Ill.

Texas Ice Cream Manufacturers' Association—Fourteenth Annual Convention, Ft. Worth, Texas, December 7, 8, 9, 1921. Headquarters, Texas Hotel. H. F. Owsley, Dallas, Secretary.

Oklahoma Association of Ice Cream Manufacturers—Annual convention, Oklahoma City, Dec. 12-13-14, 1921. Secretary, M. T Cochran, Altus Ice Cream Co., Altus.

Indiana Manufacturers of Dairy Products—Annual convention, Claypool Hotel, Indianapolis, Ind., Dec. 14. A. P. Holly, General Secretary, Indianapolis, Ind.

Kansas Association of Ice Cream Manufacturers—Annual Convention, Kansas City, Mo., December 15, 16, 1921. B. T. Perkins, Pittsburg, Secretary.

Arkansas Ice Cream Manufacturers Association, Fourth Annual Convention, Jan. 10 and 11, 1922, Hotel Marion, Little Rock. G. A. Meyer, Stuttgart, Ark., Secy.

Wisconsin Association of Ice Cream Manufacturers, Annual Convention, Hotel Plankinton, Milwaukee, Wis., January 17-18, 1922. F. E. Caughey, Secretary, Madison, Wis.

Louisiana Association of Ice Cream Manufacturers—Annual Convention, New Orleans, La., Jan. 19, 1922. Headquarters hotel to be announced later. N. F. Manning, Monroe, La., Secretary.

Minnesota State Association of Ice Cream Manufacturers—Tentative dates for annual convention, Jan. 20-21, 1922. W. M. Paulson, 2830 Colfax Ave., So. Minneapolis, Secretary.

Association of Ice Cream Manufacturers of Iowa—Annual Convention, Cedar Rapids, Jan. 24-25, 1922. P. W. Crowley, 709 Citizens National Bank Bldg., Des Moines, Secretary.

Michigan Allied Dairy Association—Annual Convention, in Municipal Auditorium at Saginaw, February 14, 15, 16, 17, 1922. H. D. Wendt, General Secretary, Lansing.

Southern Ice Cream Week

THE south assumes this week the ice cream spotlight of the country.

The southern exhibition of the Association of Ice Cream Supply Men opens in Atlanta, Ga., in the Auditorium-Armory, Monday, November 28th and extends through Friday, December 2nd, of that week.

Nearly 100 supply houses from every section of the country excluding the Pacific coast will have displays in this mammoth exhibition. One hundred fifty different essential articles will be displayed. O. S. Jordan, president of the Association of Ice Cream Supply Men, says concerning the attendance, "Hotels in Atlanta reporting room reservations up to date tend to substantiate our expectations that at least 300 different ice cream plants in the south and southwest will register at the exhibition."

The southern exhibition, in other words, will be immeasurably the greatest ever held for the benefit of ice cream producers below the Mason Dixon line.

The exhibition will include displays of machinery, services, equipment and supplies. There will be refrigerating, mixing, freezing and every other sort of machinery in ordinary use in ice cream plants and, in addition, several recent machinery developments. Originators of many special services required by ice cream manufacturers will have displays—such services as those of engineering, merchandising, advertising, etc., etc.

Every variety of equipment will be demonstrated; equipment based on metal, that based on wood, paper-base equipment, equipment for every section and process in a plant, special packaging equipment, delivery equipment of all sorts, refrigerating equipment, and so on. The supplies displayed will include the full range of necessities in ingredients, supplies and accessories.

In fact, as recent folders describing the exhibition and mailed by some score or more member houses of the Association of Ice Cream Supply Men to ice cream manufacturers throughout the country, have characterized it, "it will be an industrial market place, a testing laboratory, an idea center for the owners, executives, buyers, managers, and superintendents of plants in twenty states," arraying in a single building everything used in a plant from the office door to the shipping platform.

The southern exhibition will bring together in five days of industrial stimulation four organizations, the Southern Association of Ice Cream Manufacturers, with a membership from eleven states, the North Carolina Association of Ice Cream Manufacturers, the Tri-State Association of Ice Cream Manufacturers of Georgia, Alabama and South Carolina, and The Association of Ice Cream Supply Men with its national membership of approximately 100 firms.

An added significance attached to the southern exhibition, beyond that of its bringing into co-operation for the common purpose of industrial stimulation so many associations is in its being the first attempt ever made on a large scale to cater to the needs of the ice cream industry of the south and southwest as a section. In effect, the holding of the southern exhibition is a recognition of the southern ice cream industry's having assumed a present and future importance equal to that of the industry in other sections of the country.

The daily press has paid the same attention to no other exhibition of the Association of Ice Cream Supply Men as its representative papers in the south are and have been to the forthcoming southern exhibition. Industrial development of all sorts is being striven for throughout the south where a realization of the tremendous natural resources of the section is becoming a common possession. Officials, editors and business leaders generally have been quick to see in the southern exhibition with its attendant conventions an epoch-making event in the further development of the ice cream industry in that section and hte importance of the Atlanta show is now, as a consequence, appreciated nearly as much by the southern public as it is by those directly interested, the southern ice cream manufacturers. Its recognized significance in the future development of the south is evidenced in the columns of reading matter devoted to it by newspapers in such important cities as Knoxville, Birmingham, Atlanta, Memphis, Chattanooga, New Orleans, Charleston, Spartanburg, Dallas, Athens, Mobile, Neuville, Nashville and Pensacola.

Not only has the south itself recognized the importance of the southern exhibition, but the association of ers generally have been quick to see in the southern exhibition with its attendant conventions an epoch-making event in the further development of the ice cream industry in that section and the importance of the Atlanta show is now, as a consequence, appreciated nearly as much by the southern public as it is by those directly interested, the southern ice cream manufacturers. Its recognized significance in the future development of the south is evidenced in the columns of reading matter devoted to it by newspapers in such important cities as Knoxville, Birmingham, Atlanta, Memphis, Chattanooga, New Orleans, Charleston, Spartanburg, Dallas, Athens, Mobile, Deuville, Nashville and Pensacola.

Not only has the south itself recognized the importance of the southern exhibition, but the Association of Ice Cream Supply Men has advertised the exhibition and the conventions held in conjunction with it very extensively throughout the ice cream industry of the south and southwest. As a result, a representative attendance

AN INVITATION.

New Orleans, La., Oct. 28, 1921.

Editor, The Ice Cream Review: I do not know who you are nor even your name, but by reading your most excellent publication I feel that we are sufficiently acquainted for me to first compliment you and to further extend to you a personal invitation to sit with us in session at our meeting of the Southern Association in Atlanta and if you will promise to visit, either on your way down or on your way home, the great second port of America, New Orleans, we will show you, not only one of the most interesting cities in the world, but one with many potential possibilities.

Hoping to meet you in person, in Atlanta, I am,

Very truly yours,

BENJAMIN C. BROWN, Pres.,

New Orleans Ice Cream Co.

NO SOLDER Electric Weld NO RIVETS

Trade Mark, Registered

"Low Maintenance Cost" Ice Cream Cans
The Weight is in The Plate—All Steel and Tin

The Electric Weld GUARANTEE

1. That no solder, lead or rivets are used in the construction of Electric Weld Ice Cream Cans.
2. That all Electric Weld cans are made of a specially prepared copper-bearing, rust-resisting steel known as "tinning" or "dairy plate" and made of the same gauge material as specified in our advertising.
3. That all welds, being subjected to hammer and pressure tests, are sound and will not crack, break, leak or come apart.
4. That the can is completely assembled in the black before tinning and that it is coated by soaking the entire can in one piece in pure "straits" tin by the old-style hand dip, triple coating process.
5. That Electric Weld cans are of exact capacity and that each can is carefully examined and stamped by our Inspection and Test Department before shipping.

Patent Allowed.

The Electric Weld Ice Cream Can.

The Retinning Feature

Electric Weld Ice Cream Cans may be retinned over and over again at small cost. They are made complete in the black, leak-proof and ready for long service. Every time you retin an Electric Weld you can save approximately 30 cents. Write for prices, list of "Repeat order buyers" and other data pertaining to the **Solderless Can.**

The Non-Deforming Lid

Non-deforming edge keeps the lid round. THE RIM: One-piece expanded bead rim reinforces and protects the can from hard knocks and affords a positive grip for wet, slippery hands. SEAM: Butt welded, solid fusion of the joint that will not crack, break or leak. BOTTOM: A solid flanged leak proof bottom for hard wear and tear. No interstices or rolled edges to collect dirt. Affords a fine grip. Easy to clean. The strongest as well as the most sanitary bottom, three thicknesses soundly welded and solderless.

In 1920 the Horton Ice Cream Co., of New York, bought 2000; in 1921 a repeat order called for 5000 more. In 1920 the Breyer Ice Cream Co. of Philadelphia, Pa., bought 14,000; in 1921, 10,000. In 1920, Colonial Ice Cream Co., Philadelphia, Pa., 1000; in 1921, 30,000. Proof of quality and service in a nut shell.

is expected of ice cream men from Texas, Louisiana, Mississippi, Alabama, Georgia, Florida, South Carolina, North Carolina, Virginia, West Virginia, Kentucky, Arkansas, Missouri, Oklahoma, Arizona, Kansas, Illinois and Indiana.

"From our point of view the southern exhibition," according to O. S. Jordan, president of the Association of Ice Cream Supply Men, "is a clean-cut sales and expositional undertaking for the development of legitimate business by supply houses through the stimulation and ultimate expansion of the ice cream industry in a section blessed by nature with the most perfect ice cream seasonal conditions in the country. We are confident that we are doing the ice cream industry as a whole a service which will be more and more appreciated as the next few years witness the south occupying a more and more important position. The ice cream men at the exhibition will be not only members of the three associations of ice cream manufacturers which convene in conjunction with the exhibition, but will belong to still other associations and will include, doubtless, manufacturers who have not yet allied themselves with other state or sectional organizations of their fellow-manufacturers. Such a gathering of ice cream men from so many states, combining with the inspection of an exhibition that will reveal as nothing else possibly can, the extraordinary potentialities of the industry, will inevitably bring about increased and more profitable businesses for the ice cream men of what is really the true ice cream empire—the south and southwest."

W. M. Sidebottom, president of the Southern Association of Ice Cream Manufacturers, predicts that the Atlanta week will result in the greatest stimulus for ice cream manufacturers that his organization has ever had a part in. J. W. Clopton, secretary of the Southern Association has expressed himself similarly.

An entertainment program, exclusive of the exhibition and various conventions, has been arranged for the week.

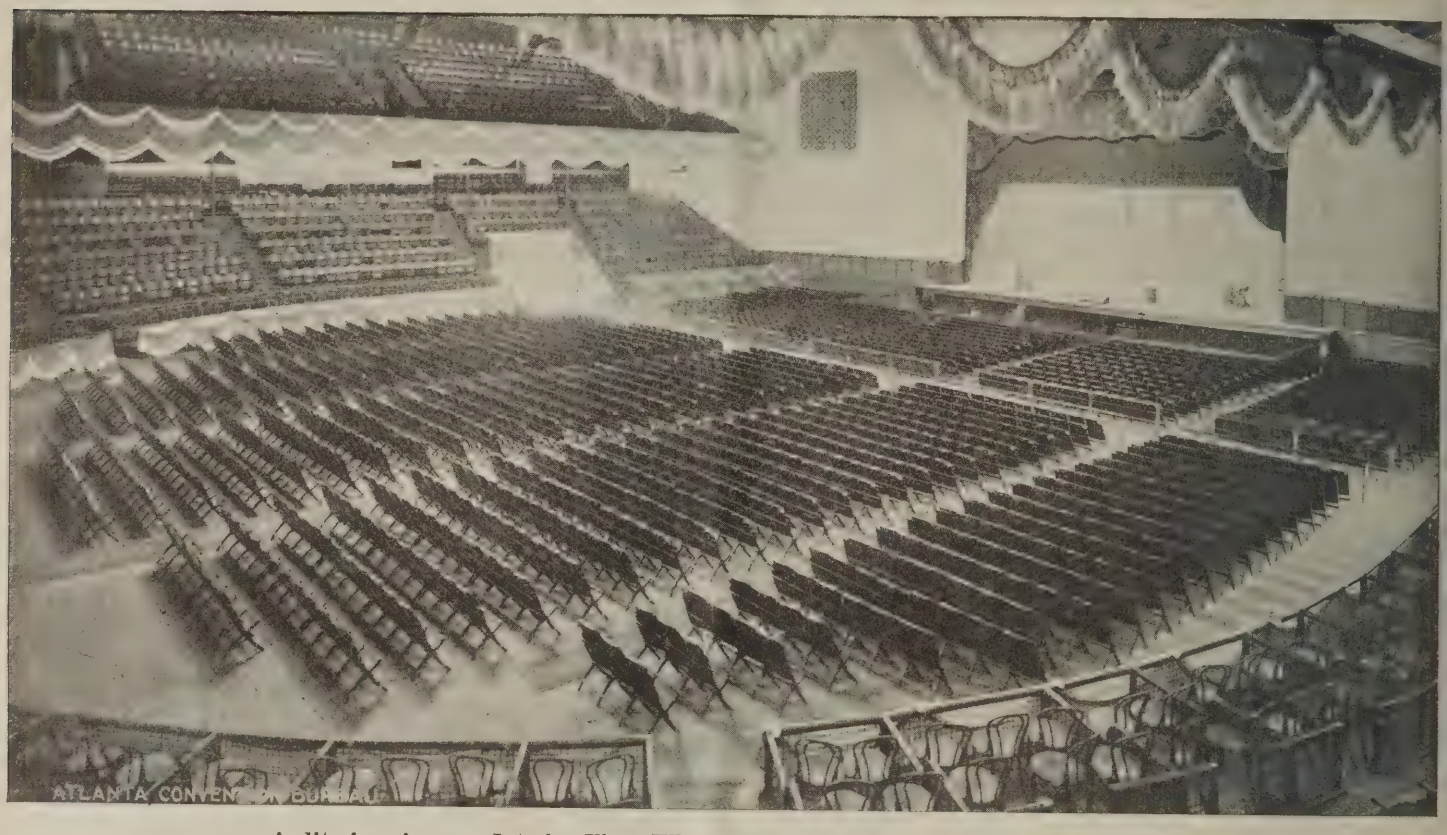
NINTH ANNUAL CONVENTION PROGRAM.

Southern Association of Ice Cream Manufacturers. Hotel Ansley, Atlanta, Ga., Nov. 29-30, Dec. 1-2.

November 29, 1921—2:30 P. M.

Meeting executive committee and board of directors.

Evening.



Dinner.—Dance. Courtesy Dixie Flyers.

November 30, 1921.—10:00 A. M.

Registration.
Address of welcome.—Mayor Keys.
Response.—Benjamin C. Brown, New Orleans, La.
Report of secretary-treasurer.
President's address.—Mr. W. M. Sidebottom, Nashville, Tenn.

11:30 A. M.

Address.—Mr. J. J. Brown, commissioner of agriculture.
The Ice Cream Situation and its Opportunities for the Future. —Prof. M. D. Munn, president National Dairy Council, Chicago.

Auditorium-Armory, Interior View, Where Convention and Exhibition Will Be Held.

12:30 P. M.—Adjournment.

Afternoon will be given to supply men, inspecting exhibits, etc.

6:30 P. M.

Barbecue in Auditorium-Armory. Courtesy Ice Cream Supply Men Salesmen Club.

Evening.

Initiation new member in Order of White Caps.

December 1, 1921.—10:00 A. M.

Improved Methods of Packing Brick Ice Cream.—Mr. Timothy Mojonnier, Chicago, Ill.

Increasing Ice Cream Sales in Winter.—Mr. J. R. Jones, Little Rock, Ark.

How to Standardize the Mix.—Prof. R. M. Washburn, Minneapolis, Minn.

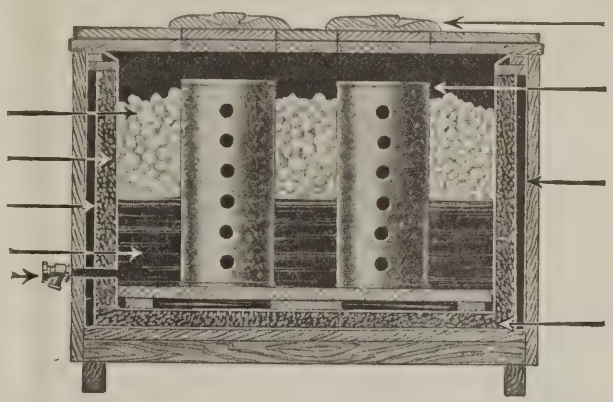
Should a Butterfat Standard be Enforced?—Led by Mr. W. E. Drake, Nashville, Tenn.

2:00 P. M.

How can the Southern Manufacturer Increase Consumption of Ice Cream per capita to compare with that of the East. —Mr. W. J. Barritt, Tampa, Fla., Mr. C. A. Odom, Macon, Ga.

The Express Situation—Mr. W. W. Campbell, Shreveport, La., Mr. Geo. L. H. White, Raleigh, N. C.

The Talk of the Show



"Quality" Ice Cream Cabinets

have proven 50% more efficient than other cabinets owing to their special construction. They are insulated on all four sides and bottom with a solid wall of two-inch corkboard which is vastly superior to the granulated cork commonly used as there is absolutely no chance of settling down from the top. In addition to this there is a ***dead*** air space between the corkboard and the outer casing. This combination has proven the most efficient non-conductor of heat and cold. They are made in a modern furniture factory where quantity production assures low selling prices.

Write for illustrated circular and prices

"QUALITY" Ice Cream Cabinets surprised visitors at the Buffalo Exposition by their superior efficiency.

The practical demonstration of their refrigerating superiority throughout the Buffalo Exposition proved that they would keep sherbets and ices in perfect condition for many hours beyond what is generally considered possible.

Our Guarantee

We guarantee our cabinets to keep ice cream in perfect condition from 24 to 36 hours with one packing. If it does not, return at our expense and we will refund purchase price.

The Grand Rapids Table Company

GRAND RAPIDS MICHIGAN

Evening.

Banquet.—Auspices of Southern Association of Ice Cream Manufacturers and Association of Ice Cream Supply Men. Gov. Hardwich, speaker of honor.

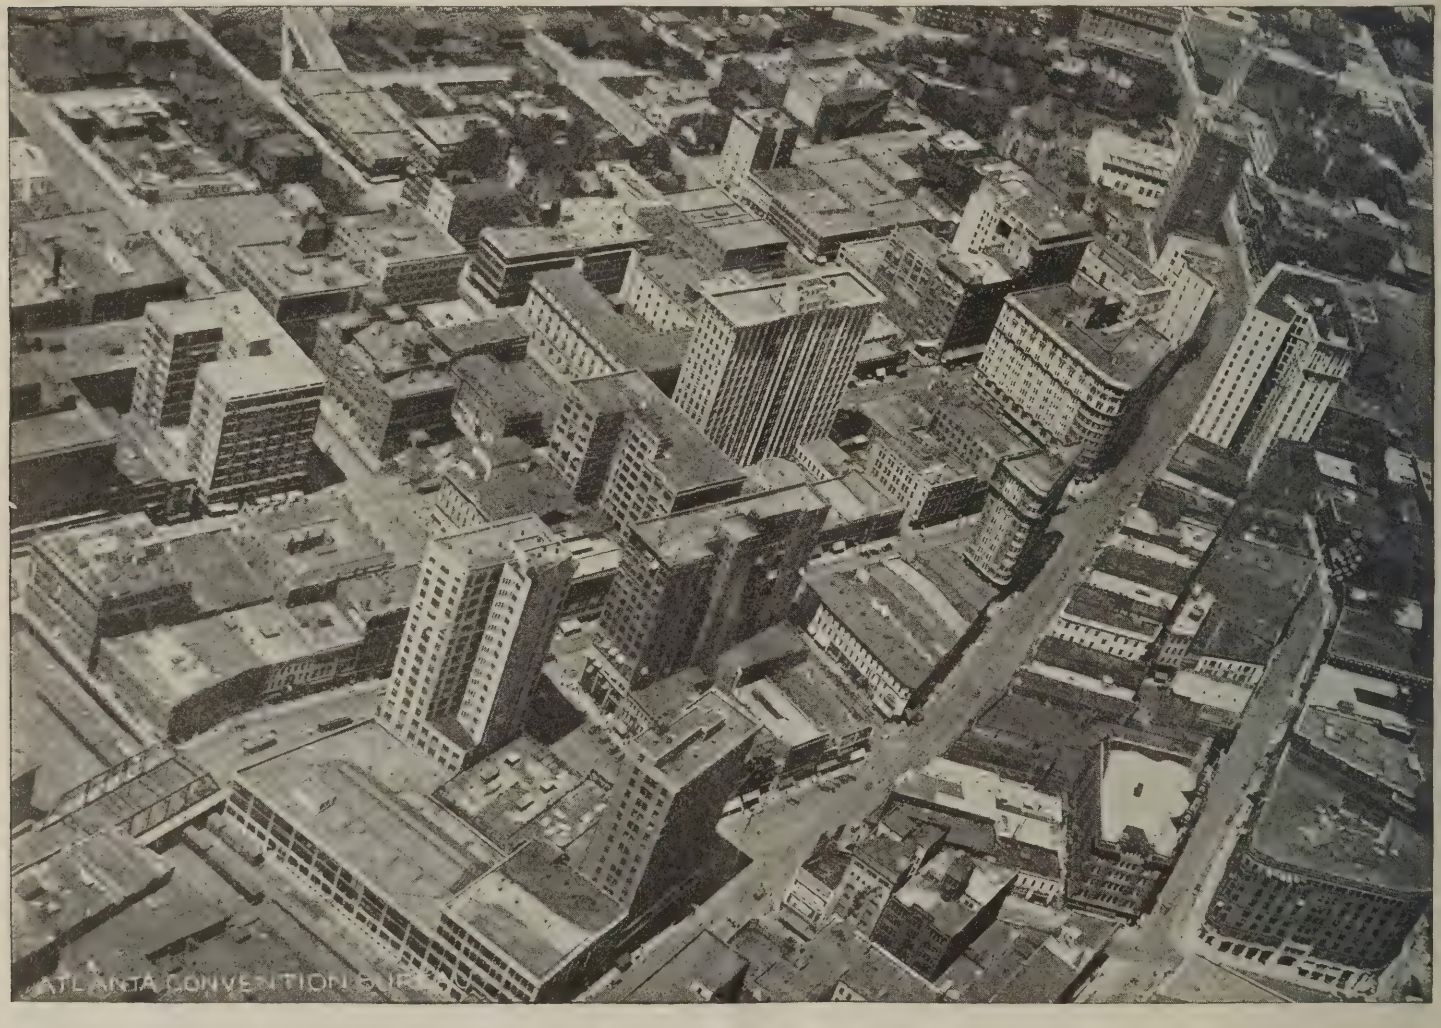
December 2, 1921.—10:00 A. M.

Business meeting for members only.
Report of committees.
New business.
Election of officers.
Executive session for ice cream manufacturers only open for round table discussion.

Evening.—Open.

ENTERTAINMENT PROGRAM.

Tuesday noon. Nov. 29th.—All members Kiwanis Club will be guests of Atlanta Club at luncheon—Kimball House.
Tuesday evening. Nov. 29th.—Dinner-dance. Courtesy of Dixie Flyers.



Wednesday evening. Nov. 30th.—Barbecue in Auditorium-Armory. Courtesy Ice Cream Supply Men's Salesmen Club. Band concert.
Initiation, National Order of White Caps, novices selected from membership Southern Association.
Thursday evening, Dec. 1st.—Banquet. Auspices of Southern Association of Ice Cream Manufacturers and Association of Ice Cream Supply Men.
The Rotary Club, Civilian Club and Kiwanis Club invites all the members to lunch with them during the week.

Monday to Friday inclusive the Association of Ice Cream Supply Men will serve a complimentary lunch in the Auditorium-Armory.

Conventions will be held in the Auditorium-Armory also, which can accommodate two or three meetings simultaneously in addition to housing the 120 booths of the exhibition. The building is the largest building used for such purposes in the entire south, and is located within five minutes' distance of the center of Atlanta's business district and of the various hotels at which ice cream men will stay. It is particularly easy of access from the Piedmont, Ansley and Winecoff hotels, the first names of which will be the hotel headquarters of the Association of Ice Cream Supply Men.

T.B.M.

You want to know what this Thomas Batch Measure is, what it does, and how it works, don't you?

Our new booklet explains the operation of the Thomas Batch Measure, how it cuts down labor and material costs and provides a means of accurate checking, and also how we have improved it by placing the opening on the side. It shows photographs of ten different freezer rooms in plants located in almost as many states. In this booklet you can read what concerns who have them, think of them. Simply for your own education, send for a copy of this new booklet.

The secret of success in manufacturing anything in this age is automatic machinery, and the Thomas Batch Measure is the cleverest, most practical automatic device for ice cream manufacturing that has been developed within the last 5 years. Nothing has approached it in its simplicity, beauty, or accuracy.

Thomas Batch Measures make possible a totally enclosed system for handling your mix; this is absolutely exclusive.

One New York State manufacturer wrote: "Have used your Batch Measures five months and feel sure they have already paid for themselves." Think! Paid for in 5 months—all profit after that.

You want to know more, don't you? Send for this new booklet!

ATLANTA, CONVENTION CITY.

The prestige which Atlanta enjoys as a city of the first rank is discerned in the very appearance of the city, with its modern skyscrapers, its public buildings, its beautiful homes, and other evidence of municipal progress. There is a strong civic spirit among the peoples which manifests itself at all times for the welfare of the city. The "Atlanta Spirit" is of an enfectious nature and inspires all true citizens with a desire to advance the city and her interests whenever the opportunity affords. Although Atlanta was founded in 1837, it practically begun its existence after the Civil War. To rise from its ashes and attain

the forefront in the ranks of progressive cities within a half century is what Atlanta has accomplished. If there were any one thing needed to proclaim to the country at large the important position which Atlanta occupies both as a business and banking center, the need was filled recently when the United States government established a regional bank in Atlanta to serve Georgia, Alabama, Florida, and parts of Tennessee. Mississippi and Louisiana.

Atlanta's altitude is 1,050 feet above sea level. This elevation means a great deal, as it insures a fine atmosphere and good natural drainage. Atlanta is the second largest mule market, it is a great center of industry, railroads, finance, education, automobile, publication and commerce. The facilities for local transit include 369 miles of electric railway. Atlanta building record for the year 1920 showed that the "Pinnacle City" lead the U. S. A. in building and erecting all kinds of structures; totaling, $13,372,666.

Conventions almost without number have been held in Atlanta, to the efforts of the civic organizations of Georgia's metropolis much of the credit for securing these important assemblies of men and women is due, but there are others, and perhaps more potent reasons why Atlanta receives such frequent recognition. Atlanta is a modern and progressive city, with all features that the term implies, such as commodious public buildings, handsome streets, complete transportation facilities, fine hotels, and advanced methods in all

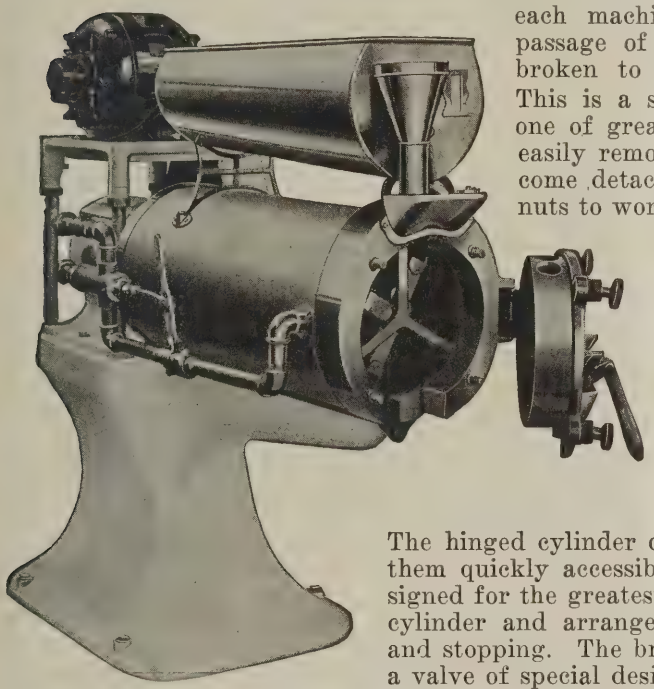
Standard Equipment for Ice Cream Plants



Immediate Shipment from Chicago or St. Paul

Creasey Ice Breaker

Every manufacturer of ice cream, large or small, needs this sturdy machine. Built over-size throughout—stands up under hardest service you can give it.

The size of the broken ice can be regulated by the use of fine or coarse combs—furnished with each machine—which prevent passage of the ice until it is broken to a certain fineness. This is a special feature, and one of great value. Picks are easily removed from drum when necessary, but they cannot become detached when in operation. No rivet heads or bolts or nuts to work loose.

More than 16,000 Creasey Breakers in use; why not put one to work in YOUR plant?

U. S. Brine Freezer

A large capacity freezer, heavily built throughout, with ample bearings and large gears. Furnished for either belt or motor drive, or can be converted from one to the other in your own factory when desired. Electric machine equipped with 3 H. P. motor.

The hinged cylinder cover is standard on all sizes of U. S. Freezers; makes them quickly accessible for cleaning. The brine jacket passages are designed for the greatest efficiency in cooling the cylinder and arranged to avoid all clogging and stopping. The brine flow is controlled by a valve of special design which gives complete control of the rapidity of the freezing process.

U. S. Freezers are made in 40, 60, 80, 100, 120, and 160 quart capacities; there is a size that will exactly meet your needs.

A handsome and practical machine that will pay for itself repeatedly in your plant. Let us give you further details and prices.

Have You This Catalog?

It is one of the most complete catalogs of ice cream machinery and supplies ever published. You will find between its covers the best of the things made by many of America's leading manufacturers —a valuable book for reference. We'll gladly send you copy on request —without obligation.

branches of public service. It is an attractive and interesting city, pleasing to the eye, with opportunity for amusement and diversion. It is a prosperous city with a population of 265,512, and, in a commercial and industrial way is quite remarkable. To sum it all up, very essential for an interesting visit is provided. Atlanta has one particularly interesting attraction in the way of a scenic freak of nature which might tempt the sightseeing visitor. Stone Mountain, which lies some sixteen miles eastward from the center of the city, is the largest single piece of granite in the world. This wonderful natural phenomenon is seven miles in circumference, at the base, and a mile from base to summit. It is bare of all vegetation, except intermittent pines and dwarfed oaks. The Stone Mountain granite is used very generously in southern and western cities for the paving and building material. From these quarries came the granite for the present post-office building in Atlanta, as well as numerous other public buildings throughout the country. In spite of the fact that this quarrying has been going on for years, competent engineers estimate that there remains not less than sixteen billion feet of workable granite.

The City of Atlanta and vicinity were the scenes of the hardest fought battles of the Civil War. It was here that Gen. Sherman began his famous march to the sea. In the commemoration of the events of those hostoric days a number of points are designated where certain important skirmishes took place, or this or that particular officer lost his life. The decisive battle before the fall of the city is very vividly portrayed by a cyclorama, maintained by the city. This is an immense circular painting four hundred feet in circumference and fifty feet high, weighing 9 tons. A Confederate veteran is constantly in attendance and points out the individuals in the picture and explains the very exciting events of that stirring July day.

Atlanta has some of the most beautiful residences in the South. Peachtree Road has long been famous for its magnificent homes. Druid Hills, a more recent settlement of an exclusive nature. Paces Ferry Road, Ansley Park, all are cities of homes, which are the last work in artistic beauty and magnificence. Street rides through these residence parks, particularly in the late afternoons are very delightful.

Visitors on pleasure bent, find Piedmont Park a very attractive spot. This park contains one hundred and eighty-five acres and was the site of the Cotton Exposition in 1895. It is now the property of the city and is maintained for public use. There are about a dozen baseball diamonds used by the amateur teams of the city, a dozen tennis courts, and a lake given over to swimming and boating. Grant Park is also the property of the city. There are a few athletic features in this park, but the shady nooks between the driveways are favorite resting places for those seeking quiet recreation. In this park is Fort Walker, a relic of the Civil War, a bit of history about which is that no shot was ever fired from it, as the forces attacking the city came from other directions.

The clubs of the city are great places of amusement and recreation. There are six golf clubs in the city, and it is said that Atlanta has more golf players than any town of its size in the world. The social life of the city centers around these clubs, and the atmosphere about them is always delight—gay.

Of no little interest to tourists and visitors are the handsomely equipped hotels of Atlanta. No city of Atlanta's size in the United States has such beautiful modern hotels, and few cities two and three times as large can boast of their equals. With oer one hundred hotels and restaurants, accommodations can be had to suit the pocket of the man of modern means, and the requirements of the most fastidious are easily met. In the heart of the city are sixteen leading hotels, with a total of about 3,000 rooms and 1,500 baths. Rates are as reasonable as could be desired, $1 a day and up.

Don't think of buying your ticket for your summer or winter trip, until you have considered the delightful attractions of the "Convention City of Dixie." Ask your ticket agent about stop-over privileges. Stop-overs are allowed on all winter, summer and all year tourist tickets, limited only to the time limit of your ticket. You will experience no trouble in checking baggage to Atlanta on these classes of tickets. If your agent can't give you satisfactory information, inquiries addressed to Atlanta Convention Bureau will receive prompt and careful attention.

Atlanta's hotels, places of interest and attractions to visitors have to be seen to be appreciated, and the Atlanta Convention Bureau extends a most cordial invitation to visit the "Metropolis of the Southeast."

ATLANTA'S BALMY CLIMATE.

Atlanta has an average November temperature of 52 degrees, and an average December temperature of 44 degrees. Its average mean temperature differs only one degree from that of Los Angeles.

"Atlanta enjoys weather almost exactly like that of the resort area of Switzerland to which thousands go every year," according to an official of the United States weather bureau.

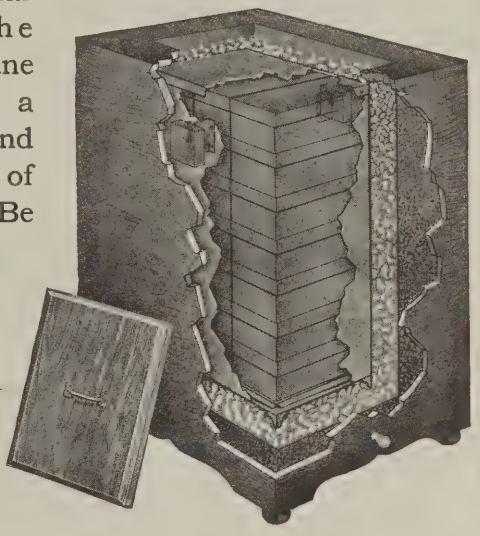
"In latitude it is far enough south to reap all the benefits of a luxurious semi-tropical climate, yet its elevation of 1,100 feet gives it the healthy, rarified climate of a mountain region."

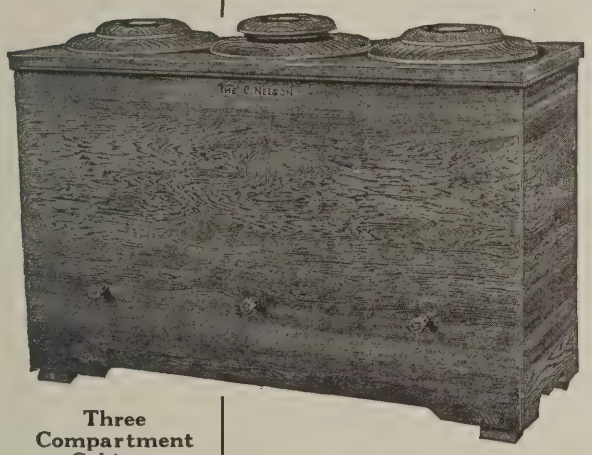
* * *

STONE MOUNTAIN: GRANITE WONDER OF THE WORLD.

Your visit to Atlanta will be incomplete without a visit to Stone Mountain. "There is but one Stone Mountain in the world, and that is near Atlanta," says a commentator on this natural wonder. "On a clear afternoon, with the sun at your back, one may see its gray bulk etched in detail against the blue sky. The visitor may go out by train, trolly or automobile and climb to its summit and look over that part of Georgia which lies within many miles around.

"It is a mountain of solid granite, the greatest monolith on the globe, 700 feet higher than the surrounding country, 1600 feet above sea level, measuring seven miles around its base, a relic of the ages. It is an inexhaustible store of granite. Man has been pecking at its base for two generations, quarrying stone to





Nelson (Patented) Ice Cream Cabinets

"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

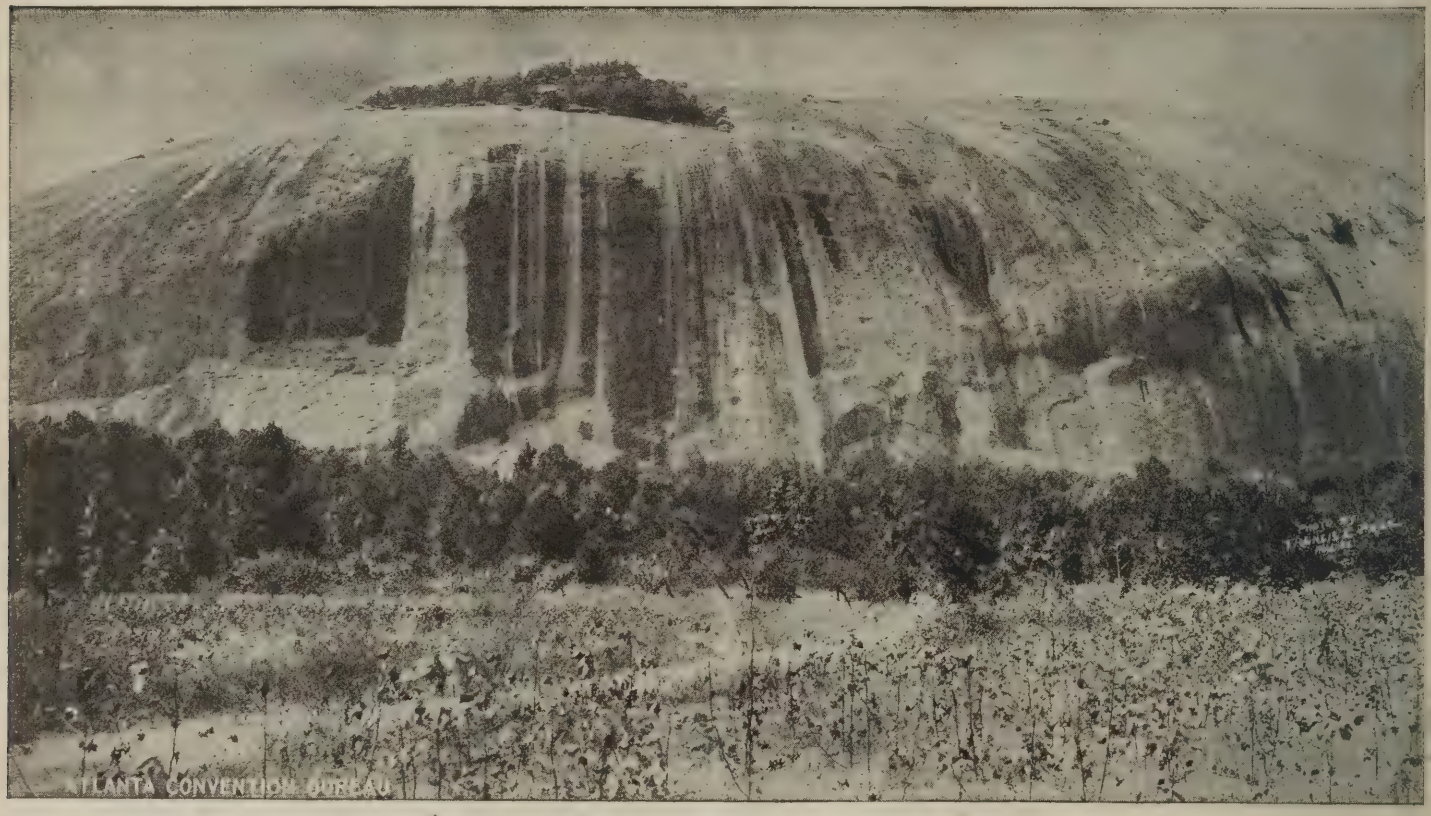
Patented Nov. 11, 1919—1321120

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
MEMBER

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.



Plan on your season's requirements now, and have your supply on hand when needed.

C. Nelson Manufacturing Co.

2308 Division St. St. Louis, Mo.

build buildings and pave the streets in Atlanta, and for the same use in other cities, but he has made barely more than a mark. Some vegetation grows here and there upon it in little oases of disentegrated stone and accumulated humus, but principally it is bald rock. Thousands visit it annually.

"A clear defined path one mile long leads up the easy slope of a spur to its summit and a path has been worn in the rock by multitudes of feet, like no other path that man's feet may walk. Beside this trail, and sometimes in it under foot, are literally hundreds of epitaphs cut in the all-enduring monument, some so worn that the changing seasons of years have nearly obscured them, and others cut last week, perhaps, by the great grand descendants of the original climbers.

Stone Mountain, the World's Largest Monolith.

The philosopher will see in this rich food for thought upon that pathetic little trait of human nature which would stamp its identity somewhere so that it may not be lost in oblivion of time."

The United Daughters of the Confederacy have obtained a deed to the steep side of the mountain, which is almost perpendicular. There will be carved in relief a monument of the Confederate Hosts; a stupendous memorial to the South's heroes. A life time will be required for the work of carving this picture of Lee and Jackson at the head of their army. Stone Mountain will stand through the ages as a memorial to the brave sons of the South who sacrificed their lives, their himes, their all for The Lost Cause.

In the days when De Soto's discoverers were wandering through the wilderness around it, this mountain was an Indian landmark, bearing upon which many a trail turned. Sometimes an Indian girl would jump from its summit and sacrifice her life to please the Great Spirits.

Science has it that Stone Mountain was once a volcano and the part now seen was cooled off thousands of feet below the surface of the earth and brought to the surface by erosion.

FOR SOLVING LOCAL PROBLEMS.

The Kansas Association of Ice Cream Manufacturers will convene in annual convention at Kansas City, Mo., Dec. 15 and 16; headquarters, Baltimore Hotel.

It appears at this time that our coming convention is going to be the best yet, at least our fellows are talking that way so let every member of our association be there and see that any ice cream man not now a member, receive an invitation and at the same time explain the reasons why they should become a member.

While our National Association and meetings are essential and very beneficial to the industry at large, we have always found at our state and group meetings our local problems are more freely discussed where the men are directly interested in a competitive way.

Your attendance at this meeting is a duty you owe yourself and the industry. The good fellowship developed by coming in contact with your fellow manufacturers, is of much value and help. Our meetings we hope will be both instructive and entertaining.

Let us all boost and pull together to make it a great convention.

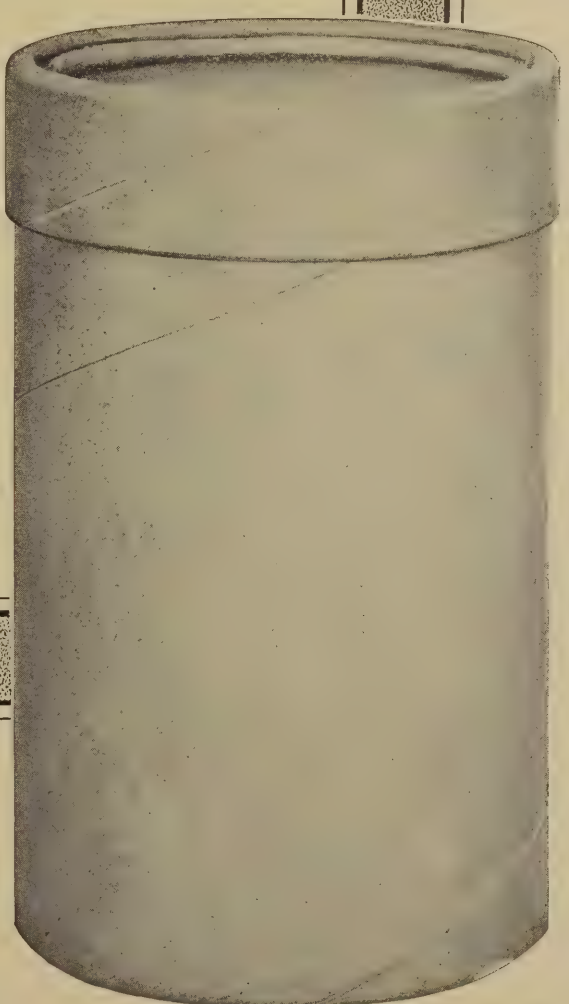
THE KANSAS ASSO. OF ICE CREAM MFRS.
L. R. Manley, President.

LOUISIANA ASSOCIATION OF ICE CREAM MANUFACTURERS DECIDE ON CONVENTION DATE.

The Louisiana Association of Ice Cream Manufacturers have definitely decided upon the date of their annual convention to be January 19th, 1922, at New Orleans. Definite instructions as to hotel accommodations will be announced in our December issue.

Don't miss a single copy of The Ice Cream Review. We'll see that you do not if you send us two dollars for a year's subscription.

Retains the Flavor



SEALRIGHT Liquid-Tight Paper Containers "hold in and keep" that important element in your good bulk ice cream, the FLAVOR. The air-tight feature of "Sealrights" prevents freezing out. Filled direct from the freezers and placed in the hardening room, "Sealrights" deliver your bulk cream in the same, identical perfect condition as when frozen. All the goodness retained and harmful factors kept out.

Furthermore

Sealrights are neat, attractive, sanitary, easy to carry, stimulate carry-home sales, eliminate the expensive brick method and keep ice cream in perfect condition longer and more effectively than any other known type of retail ice cream package on the market today.

IOWA DAIRY SHORT COURSE.

The Iowa ten day Dairy Short Course for experienced creamery buttermakers, managers, ice cream makers and operators of market milk plants is offered from February 8th to February 18th. Only such operators as have had several years practical experience will be admitted.

Men without experience or with a rather limited amount of experience may enroll for a three months' course, beginning January 2nd. This is a part of the regular six months course, but is conducted as a seperate unit. Those taking the three months' course should secure work in some creamery during the summer months so they may have the benefit of the practical experience if they decide to return the following fall to complete the course.

The work offered during the three months, from January 2nd to March 22nd, is as follows:

Dairy practice every forenoon. In the afternoons, lectures on the following subjects:

Buttermaking	1	hour	per	week.
Cheesemaking	1	"	"	"
Milk Testing	1	"	"	"
Factory Management	2	"	"	"
Judging Dairy Products	1	"	"	"
Market Milk	1	"	"	"
Dairy Bacteriology	2	"	"	"
Dairy Cattle Feeding and Mgt.	2	"	"	"
Farm Crops Production	2	"	"	"

Those who enter the course beginning January 2nd and desire also to take the additional three months' work offered during the fall will during the fall term work in the following subjects. Dairy practice every forenoon:

Buttermaking	2	hours	per	week.
Milk Testing	2	"	"	"
Manufacture of Ice Cream & Ices	2	"	"	"
Dairy Chemistry	2	"	"	"
Dairy Machinery	3	"	"	"
Dairy Cattle, breeds & judging	2	"	"	"

Fur further information, address Dairy Department, Iowa State College, Ames, Iowa.

⚜

THIS IS A NEW ONE.

Says the "Democrat," Onawa, Iowa:—Chris Nelson, formerly a teacher in the Onawa schools and later proprietor of the Royal ice cream parlors, is no doubt destined to become a wealthy man if nothing unforeseen happens. For several months, in fact nearly two years, Chris has been working on a new device to sell more ice cream. He had it so well worked out that he applied to the government for a patent on his invention and recently received word that the patent had been granted.

The machine Chris has been working on and which he now has a patent on is called an ice cream candy bar machine. The machine will make a candy bar of chocolate or any other flavor with the filling of same entirely of ice cream. It is claimed that the bars will keep several days without the ice cream melting. Already Mr. Nelson is receiving inquiries from all parts of the country regarding his invention.

It is understood that already the machines are being made and will soon be put on the market. One machine is capable of making about 15,000 bars a day.

Seven P'S of Perpetual Pro-Motion

By J. W. CLOPTON, Secretary, Southern Association of Ice Cream Manufacturers

Editor, The Ice Cream Review: The one big convention of the south will be held in the Hustling City of the South, Atlanta, Georgia, Nov. 29th to Dec. 2nd, inclusive. This has ceased to be news and has developed into the general topic of conversation among the manufacturers of the south, and I am pleased to say that quite a few of our fellow manufacturers of the north, east, west and southwest have expressed their decision to meet the boys of the Southern association in Atlanta.

While conditions have not been the best for the Southern manufacturer this season on account of readjustment of prices and conditions generally we are not at all discouraged and we are determined to go into next season with an idea of selling more ice cream and better ice cream than we have ever sold before.

With the assurance that the tax on ice cream cones, better known as the "nuisance tax," will be eliminated before another season, we can again go after the masses of small dealers who have been forced to discontinue the sale of ice cream as they were not prepared to keep correct records of their sales, causing many of them to get in "dutch" with the revenue department.

We have been very fortunate in securing very able men to handle the subjects on our program in Atlanta, and we have every reason to believe our program will be carried out to the letter. In this connection allow me to give a convention hint to the boys who are planning to go to Atlanta. I want you to "Mind your P's and Q's"—more especially your P's: Be Present; Be Punctual; Be Pleasant; Be Patient; Be Progressive; Be Prudent; Be Public-Spirited. Remember you are not the only fellow there and if you have an idea that is practicable, tell your fellow manufacturer about it. Don't be afraid to rub shoulders with him and discuss your problems freely with him, he might help you out.

Our good friends Fred Scanlon, George Moore and Harry Helmar have given us the assurance that we will have the key of the city, in fact Mayor Key will make the welcome address and the Key note of his address will be to the effect that Atlanta will be turned over to the ice cream men for a week, in behalf of the Southern Ice Cream Manufacturers, our old friend Ben Brown of New Orleans will accept this Key in his usual jovial manner and will hold it in trust during the week.

Not only will be have the Key of the City of Atlanta, but we will have Gov. Hardwick with us, who will welcome us to the great old "Goober Grabber" state of Georgia. If the boys are not satisfied with the city, Gov. Hardwick will just turn the state over to them. On our program are such men as J. J. Brown, of the State Department of Agriculture; M. D. Munn, President of the National Dairy Council, Chicago; Timothy Mojonnier, of Chicago; J. R. Jones, President, National Ice Cream Co., Little Rock, Ark.; W. E. Drake, President, the Union Ice Cream Co., Nashville, Tenn.; Prof. R. M. Washburn, of Minneapolis, Minn.; W. J. Barritt, President, the Tampa Dairy Company, Tampa, Fla.; Chas. A. Odom, President, the Odom Ice Cream Co., Macon, Ga.; W. W. Campbell, President, the Campbell Ice Cream Co., Shrevesport, La.; George L. H. White, President, the White Dairy Products Co., Raleigh, N. C.

W. M. SIDEBOTTOM, President.

J. W. CLOPTON, Secretary.

A. M. THORNTON, Ex-president.

Under Their Administration the Southern Association Has Accomplished Much.

Can you beat this bunch of fellows? You'll have to sight me if you can. Remember, "All roads lead to Atlanta" during Ice Cream Week, Nov. 28th to Dec. 2nd, 1921.

Tom Stuart and Pete Miller will tell you what the Dixie Flyers are going to do and Robert Everetts will give you the dope about the National Association of Supply Men. All these boys will be there at the same time and you can just bet your bottom dollar there will be something doing every minute. Let's go!

THEM'S MY SENTIMENTS 'XACTLY.

"I would as soon think of doing business without clerks as without advertising."—John Wanamaker.

"There is not a business that correct advertising cannot make better."—Arthur Brisbane.

* * *

"Success depends upon a liberal patronage of printing offices."—J. J. Astor.

Standardization of Ice Cream

By Weight Per Unit Volume

De Raef weight standardizer tells you at a glance the correct weight per gallon, while the ice cream is still in the freezer, giving the ice cream maker full control of a standard weight per gallon as well as a given over-run.

No weights—no charts—no counter balance—no telescopic cups — no adjustments — no magnifying glass to read dial—no figuring—always ready for operator—water proof and rust proof.

Works automatically—reading can be made ten feet away—large black figures on white dial. Will give correct weight per gallon of ice cream, regardless of weight per gallon of mix.

De Raef Ice Cream Weight Standardizer circular sent on application to the Ice Cream Department

Reward Offered for Best Attendance

Beautiful Loving Cup for Southern State Registering Greatest Attendance at the Southern Show. **By GEORGE L. H. WHITE, President, North Carolina Ice Cream Manufacturers' Association.**

DO YOU remember your childhood days and the high tension of enthusiasm that filled and thrilled you around Christmas time? Well, the same degree of enthusiastic spirit, although of a somewhat different nature, seems to have gripped the ice cream men throughout our section of the Southland. We are counting the days to the hour of departure for the "New York of the South" where the Auditorium Armory will be bedecked in gladsome colors with a setting made complete by a host of supply men and their showing of various wares, topped with "soothing jazz," a combination irresistible for the ice cream man. Did you say crowd? No, there will be a mob—North Carolina always among the leaders in all lines of history making endeavors (oftime the leader—in production of moonshine and monkey rum, for instance,) will be conspicuously represented. Not in great numbers, perhaps, but in great variety, lean men and fat ones, tall men and short ones, but only **white** ones regardless of President Harding's recent statement in Birmingham. Let me assure you of one fact, when the curtain falls on the Atlanta Show everyone present will know the Tarheels were there, for we do not propose to lose our identity in the crowd, even if we don't wear bells. Some of our boys have suggested we might be lost in the crowd, but our ever alert and efficient Secretary, Arthur Eversharp Dixon, thought of this long ago and has had prepared—well, you fellows from other states will all wish you were from North Carolina in order to wear our festive ornaments, but for the reason it will tax the plant of Tiffany & Co. to its capacity to make sufficient quantity of these regalias for our own family, we would undertake to distribute them around.

The Tarheel aggregation has arranged for spacious quarters at The Ansley, and we want to offer the use of our quarters to the visitors for their convenience (and I have previously stated the line of endeavor for which we are particularly in the limelight) as we want a more extensive acquaintance among the fellows because some day we want to entertain the Show in The Land of Tarheels.

I want to appeal to the men who compose the ice cream industry of the South to make immediately their plans to visit Atlanta during the week of Nov. 28th to Dec. 3rd, and as an incentive I am going to offer a large loving cup to the Southern state registering the largest attendance during the first three days of the Show, North Carolina being excluded from this offer for the reason I know we will be there one hundred per cent, and I don't care for our bunch to be the recipient of a loving cup from myself. The state to whom this award is made will be asked to place the cup within the walls of their museum or hall of history until our next meeting, when it will be again awarded under the same conditions, until won twice in succession by one state.

A. E. DIXON, President.

J. W. MULLIGAN, Ex-President, Dixie Flyers.

GEORGE L. H. WHITE, Secretary.

There are quite a few men in Dixie engaged in the ice cream industry who have as yet not become regulars at the different ice cream conventions, but if we can persuade them out this once I am sure this Atlanta Show, with its Rebel hospitality and Yankee Bull (notwithstanding Durham, N. C., is the home of Bull and Bears) they will be regular attendants at future meetings.

Come now, all you fellows who make the national dessert, cast aside your B. V. D.'s and don your woolens for one grand, glorious, entertaining and instructive trip to Atlanta, ever mindful of the expense, energy and effort of the membership of The Supply Men's Association involved in these meetings for **your** pleasure and **my** pleasure, and it is them and kindred organizations and and publications that I am so deeply indebted for royal entertainment and instructive displays previously enjoyed.

Here's hoping, Dear Reader, I will make the acquaintance of most of you in Atlanta.

Cincinnati, Ohio

When the clans begin to gather in Atlanta the natives are going to acquire sore eyes and lame necks from seeing what they will see if they don't look out. For

Come on Boys, Meet Us at Atlanta.—Pete and Tom.

instance, here we have the genial president and secretary of the Dixie Flyers just as they will appear on the streets of the southern city looking for a "cop" to direct them to convention hall.

Miller will be smoking a cigar that he won on an election bet last fall and Stewart—a man with such "taking" ways that he carries an umbrella around with him on a sunny day, providing he finds one that isn't locked up.

The editor does not enjoy the acquaintance of either of these estimable gentlemen, but ever since we connected up with this job we have heard reports coming from the southland and the officers of the Dixie Flyers generally are mixed up in them. We understand that Miller is of Danish descent (H. P. claims a Dane can't descend) but we don't know whether he is of the domestic or imported variety. They do tell us though that serious international complications were at one time threatened on account of a dispute between the two countries concerning Miller. Both claimed him. Denmark claimed he belongs to the United States and the United States claimed he belongs to Denmark.

One of the boys tells a good story on Stewart. He took the Mrs. to a convention a year or two ago and between meetings took particular delight in showing her about town and made extra efforts to impress her with the fact that extensive travelling gives one confidence and a superior bearing. Meeting a young lady friend who smiled as she passed, Stewart turned to his wife and said: "See that girl smile at me? You know for why?" "That's nothing," replied Mrs. Stewart, "the first time I saw you I nearly laughed my head off."

That good lady is confronted with a perplexing problem, too. She says she promised the minister when she was married to Mr. Stewart that she would go wherever her husband went. Eventually she wants to go to heaven, but doesn't want to violate her marriage vows (of course there is yet time for friend Stewart to mend his ways and thus relieve his good wife from such an embarrassing predicament.) Possibly the Atlanta meeting will bring about the needed reformation. True Dixie spirit, mixed with several good orders, may send him home a changed man.

* * *

Reports from the various Dixie Flyers to the secretary would indicate that the attendance at Atlanta is going to be mighty fine, and this being the first exhibit in the sunny South, the ice cream manufacturers who attend this convention are going to leave there with the knowledge that they have learned many things that more than repay them for their trip.

The entertaining features have all been carefully laid out and are such that it will make the stay enjoyable to all who attend.

The Dixie Flyers are going to entertain on the evening of the 29th, which is Tuesday night. The entertainment committee are hard at work and they ad-

vise the secretary that the Dixie Flyers' entertainment will be of the highest standard and a credit to the organization. Of course it's up to the Dixie Flyers to help and we are sure that they will more than do their share.

Those Dixie Flyers who are making the southern trip should certainly keep encouraging not only attendance at this exhibit of the Ice Cream Supply Men, but membership in the Southern Ice Cream Manufacturers' Association. Membership in this association does not only promote social interests but creates a friendly feeling among the various manufacturers, and at their meeting there are many good papers that will prove profitable to any ice cream maker whether he be large or small. There is no ice cream manufacturer who is too large to be a member, and at the same time there is none too small to gain advantage by its membership.

Your secretary had the pleasure of meeting Mr. A. E. Dixon of North Carolina, and here is a real enthusiastic secretary and the Dixie Flyers should take particuler pains to see that this bunch that come from the "tar-heeled" state have the opportunity of seeing the sights and getting real advantage of attending this show. Boys, they are a live bunch and those Dixie Flyers who travel that territory will surely back me up. Use your efforts to show the Carolinians that the Dixie Flyers are on the job.

Our one honorary member, Mrs. E. R. Harris, of New Orleans, is working hard for the Atlanta Show and she promises to attend and help the good cause along. Also boys, make note that her son, Sydney Prague, will be with us and this will be his maiden visit to a convention. I know that the Dixie Flyers will be glad to see him and will extend a hearty welcome.

Another bit of news, boys, the ladies of the Southern Ice Cream Association advise us that they have some money in the treasury and they want to spend it. It surely is the days of sufferage, when the women want to do the entertaining. God bless them, we like every one of them, but we are a wee bit old fashioned and cannot see the idea of the ladies entertaining us, but our President, P. N. Miller, does hope to have the pleasure of entertaining the ladies one afternoon. Some wag suggested that we entertain them the afternoon on which the stag affair occurs and make the entertainment so strenuous that they will be tired and go to bed early, but some of the married men advise me there is nothing to that, I guess we would rather have the ladies with us.

THEY ALL FALL, SOONER OR LATER. One of our entertaining committee has not been very active of late and investigation shows that he had a good reason, for it appears that on Monday, Oct. 17th, Harry E. Blanke took unto himself a bride. The fair lady being Miss Edna Hils, of St. Louis. I know the congratulations of the Dixie Flyers will follow the bridal pair and their best wishes for many years of happiness, and may their only troubles be little ones. The Dixie Flyers hope that Mr. Blanke will bring the bride to Atlanta and we promise to act in a decorous manner.

We hear that there is a carload of ice cream manufacturers coming from Texas. We understand that Mr. A. P. McLendon will lead this party. We will all be there waiting for them with our "hair in a braid."

Take time by the forelock and send your check for your dues to the secretary.

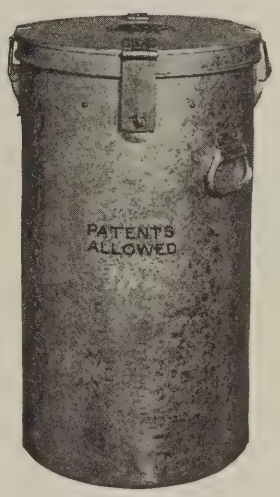
MRS. HARRIS AGAIN.

Dear Boys:



I have been reading our column with a great deal of interest lately and noted the message to me from our Mr. Mulligan. He had heard the "little Bill" manuscript while visiting our home therefore knew it had been cut off, well I'm sorry it happened and guess it must have been my fault for using both sides of the paper, the other side was not copied. I shall read it to you boys for you need that message and your wives will agree I'm right, I hope to meet you in Atlanta this year.

Have you ever heard the kiddies play the game of "Pigtail"—one says, "what's your name," the other says "Pigtail" where do you live, the answer is "Pigtail", who do you love, again its "Pigtail, so on and on. Well there's a new game called "Ice Cream" and it will be played in Atlanta, Ga. for three days and I want to urge you all to come and bring the lady folks to help us play the game. The ice cream men will meet

Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Iceless Express Container.

What Would it Save for You?

Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover

Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical ways in which they help to develop business.

Decy IceLess Express Container Co.

Incorporated

TIMES BUILDING Room 1001 NEW YORK, N.Y.

their best friends the supply men, you boys, and the visitors will witness a very interesting game, for in twelve months time they have all learned something good for each other to know. What's your name "ice cream", what's the best food for the community, "ice cream, what do you love, "ice cream". When you want the best food for the least cost what's the answer? I scream—ice cream. New flavors, new shapes, new methods of filling, etc., will be shown, you will even be shown how to make ice cream Heat (h) way.

I'm now visiting the plant in Gulfport of which our son is manager and by the way will be a visitor this year to the convention, this will be his initial trip so I want it to be a winner.

We ladies have some money to spend on a good time together so guess we will do it this year. Mr. Odom made it impossible for us last year having prepared so lavishly for us.

Until we meet in Atlanta, au revior.

MRS. E. R. HARRIS.

Wheeler, a member of the McLaren Ice Cream Co., is in charge.

A new ice cream plant and creamery has been established in Tallahasse, Florida, under the name of the Leon County Milk Co. The new firm has just opened for business. The entire ice cream equipment were furnished by The Creamery Package Mfg. Co. Mr. J. M. Burgess is in charge.

GOOD NEWS.

Jackson, Miss., October 29, 1921.

The Ice Cream Review:

The McLaren Ice Cream Co., Tupelo, Miss., has purchased the ice cream and ice making plant of the Clarksdale Creamery Co., Clarksdale, Miss., and Mr.

We would make him pay $2.00 per
For a room without heat and a broken down chair
In a bed he should sleep, that sags in the middle,
And there let him wallow and swear.
With a blanket too short, and wait for service
Do without soap and towel,
And feel that we're justified
In making the rascal howl.

We would then put in the picture
Something to make him sick,
The sliding scale of the rate per day;
A scurvy hotel trick.
So much for the room, American plan
The meals are such and so—
In either case a bonus you pay
The (American?) plan that get your dough.

The screen of the future most feature
A hope that will banish this graft.
And the home of the traveler grow brighter
As he ponders the troublesome past,
When hotels will honestly cater,
And justly their patrons provide.
We then will make a picture
Where salesmen can live with pride.

MOULTRIE PLANT IMPROVED.

Extensive improvements have recently been made in the plant of the Moultrie Creamery and Produce Co., Moultrie, Ga. This company has recently installed a Mojonnier vacuum pan, two 300-gallon Cherry pasteurizers, coolers, and a 20-ton Vilter ice machine with ice storage room for same.

They will manufacture ice cream, condensed milk of all kinds; pasteurized milk and cream and butter. Their ice cream department has been increased to a daily capacity of one thousand gallons.

Milk is being received by baggage from Americus, Ga., a distance of 75 miles. The Georgia Florida Farms Corporation of Asheville, Florida, is also delivering their milk to this plant, same being delivered in a White truck, with flanged wheels, operated over the Georgia Northern railroad.

In years past cotton has been the principal crop throughout this section, but owing to the recent activities of the boll weevil and low prices, the farmers are looking more and more each year to dairying. This is a modern plant in every sense of the word and is the first of its kind in the state of Georgia. It is under the management of Sam Weichselbaum.

ROY S. JENNINGS.

* * *

IS IT WORTH WHILE.

In about three weeks you will be called upon to pack your grip, for a journey that will bring together a group of men that control one of the greatest industries in the South. They not only control the output of this wonderful product, but are in a position to multiply, extend and control its future and destiny for all there is in it.

This journey they contemplate is for the purpose of furthering their interests, and the question that is uppermost in their mind is, what I can do to make the trip "worth while." And right here is where I want to say, **make your plans to go,** and when you get there be prepared to make "Worth While."

There are a dozen reasons, any one of which should take you to the Atlanta convention, and you should prepare your brief and be ready to state your case in a well thought out way.

You have been worrying, no doubt, regarding the unfair methods utilized by some of your competing neighbors. This is your opportunity to meet them and adjust your differences. The chances are that you will find them altogether different than you had imagined. Isn't it "Worth While" to get acquainted?

You will hear talks, see new departures, from old ideas you have followed. In a word, you will be in touch with matters absolutely essential, from a financial and monetary standpoint.

You may be paying too much freight, or not have the right price on some product, you may be long on something, and through a new acquaintance, find an outlet for it.

Don't get the idea that you are paying too much for the show, you must always pay your way if you travel, and since you are one of the company, it remains to be seen whether you are a credit to the organization. You must help make it a success, and the dividends that you receive will be commensurate with your efforts, and the first cost will be absorbed in the short cuts to success, you gain through the medium of good fellowship, as rubbing shoulders, hand shakes, not to speak of "Tangle Foot" and other attractions, that hang over such aggregations, like a fog over a mill pond, and knowing a good many of you fellows, and being pretty good at prognostication, its a safe bet, I believe, that you will become so inoculated with the spirit of the occasion that you will go home with an enthusiasm that will not need any shock absorbers to help you over the rough places of 1922.

The writer knows how the ice cream man feels regarding the past season, and he thinks he must husband his resources by staying at home.

But, should you by staying at home, miss **some advantage presented at the convention** that your **competitor** gained, whereby he was able to make a saving of 5 or 10 per cent by employing some new process, you would have to make a charge to profit and loss, against false economy.

So shine your shoes
And brush your hair;
Pack your grip,
But don't you dare
To make the trip
With all its strife,
Unless you bring
Along your wife.

200 Manufacturers For Cleaner, Purer, Better Ice Cream!

Approximately 200 ice cream manufacturers of the United States and Canada are pledged to make cleaner, better, purer ice cream.

They are heeding the United States Department of Agriculture admonition that air is a disastrous ingredient. So, they are making their ice cream without air.

A chain is only as strong as its weakest link. A manufactured food product is only as pure as its least pure ingredient.

Air is loaded with dirt, dust and germs. Whip filthy air into your 100% pure mix and you do **not** purify the air, but you **do** contaminate the mix.

It was an epidemic caused by infected ice cream that started Prof. W. P. Heath experimenting to find a way to make ice cream without air. That epidemic was fatal to two and nearly so to one hundred others. Yet, the plant where this happened was one of the cleanest, finest, most modern ice cream factories in the world. But it happened, just the same.

The advantage in making ice cream the HEATH-WAY is not alone a question of improved flavor — although that counts. It is not alone a question of greater advertising value — although that helps. It is not alone a question of finer texture and better standing up quality — although they count. It is primarily a question of WHETHER OR NOT YOU WANT TO CONTINUE MAKING ICE CREAM WITH AIR THAT IS NEVER CLEAN AND OFTEN DANGEROUSLY IMPURE.

You owe it to yourself to protect your product. You owe it to your dealers to protect their product. You owe it to the people who eat your ice cream to protect them — all of them — from this lurking danger which exists in the air you are whipping into your freezers.

TWO HUNDRED progressive manufacturers have seen the light. Surely you also want the latest that science offers.

Then get in touch with us. You have much to learn about Heathmade Ice Cream. Let us tell you about our method. It does not require any change in your present methods of manufacture or mix. Write to us NOW.

Keep on Calling.

He said he didn't need a thing—
That he was loaded to the neck
With coffee, soap, and Boston beans
And sugar by the peck.
He had enough of all my stuff—
But I kept on calling.

S. A. SMITH,
Elyria Enameled Products Co.,
A Dixie Flyer.

C. E. ROGERS,
He Ought to Be a Dixie Flyer.

C. T. HOLLINGER,
Hudson Mfg. Co.—A Dixie Flyer.

Each trip the same old song and dance—
"Can't buy a thing today."
He liked my line—he liked the house,
But nothing came my way.
I used to swear at that old bear—
But I kept on calling.

One day I almost passed him up.
"That bird's a hopeless case"
Says I, "I'm wasting time with him,
I'll scratch him from the race.
I'll let that guy run off and die"—
But I kept on calling.

And finally he came across,
I got him single-handed.
You'd be surprised now how he buys,
He's the best account I've landed.
And so I'm glad—almighty glad—
That I kept on calling.—The Salt Seller.

Heard at the Dairy Show.

A Supplyman: "My love for you is like a flowing brook!"

The Blonde: "Dam it!"

NORTH CAROLINA SECRETARY ACTIVE IN EFFORT TO ELIMINATE "NUISANCE TAX"

Bulletin No. 16.

Emphasizing Bulletin No. 12 issued on August 9th, we cannot too urgently emphasize the fact that concerted and insistent action is necessary for the elimination of the tax on ice cream sales, which is vital to the industry, not only in this state but to the whole country. Supplementary to Bulletin No. 12, we give below a copy of a letter from Mr. H. E. Cartland of the Arctic Ice Cream Co. of Greensboro, N. C., which covers the situation:

"Conditions are changing hourly in the U. S. Senate, and there is hope that the nuisance tax on bottlers and ice cream dealers will be eliminated entirely, but to get this done we must have concerted action. A great many former dealers of ice cream are not handling on account of this tax, and without doubt the tax is cutting into the volume of the manufacturers.

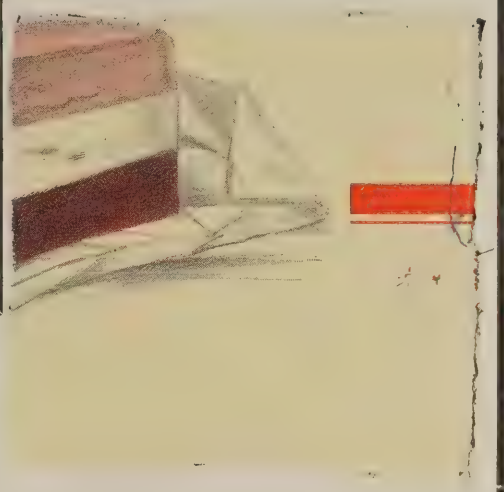
Would suggest that you request every member of the N. C. Ice Cream Manufacturers Association to wire Senators at once, demanding the repeal of the tax law. Concerted action now will get it, but if we go to sleep on the switch we will find a sign stuck in front of our noses reading: Pay 10 per cent of your sales in taxes —A LOST OPPORTUNITY GONE. I have already made my plea, not once but half a dozen times, last, as of this date, by wire.

Write or wire your senator and representatives, urging them to do everything possible to remove the tax on the sales of our product.

Sincerely yours,

A. E. DIXON, Secretary.

⚜



JOHNSTON JOINS NORDHEM.

Mr. Frank Johnston, well known in the ice cream industry, has been appointed western representative for the ice cream syndicate department of the Ivan B. Nordhem Company to succeed Mr. E. B. Conliss. Mr. Johnston will make his headquarters in Los Angeles, Calif.

The Grand Rapids
ICE CREAM CABINET OF QUALITY

STYLE No. 5

Construction of Our "Zero Brick" Cabinet

An Important Part of Your Equipment

IT is to the advantage of any manufacturer to recognize the true importance of the ice cream cabinet and the necessity for employing only the kind which will afford perfect preservation of his product on an economical basis.

For many years, Grand Rapids Ice Cream Cabinets have demonstrated in actual service that they are the answer to the ice cream cabinet question. They are constructed with a thorough understanding of the qualities which a cabinet must have in order to effect ice conservation and withstand the action of the refrigerating agents.

Standardizing on Grand Rapids Ice Cream Cabinets is a step which leads to saving expense and promoting all around satisfaction.

BRANCH OFFICES IN THIRTEEN CITIES

ILLINOIS ASSOCIATION OF ICE CREAM MANUFACTURERS.

The 22d Annual Convention of this Association Will Be Held at Chicago, Hotel Sherman, on Tuesday and Wednesday, December 6th and 7th.

To the Members:—In connection with the above announcement, please note the following quotation from a statement made by the late Theodore Roosevelt:

"Every man owes a part of his time to the upbuilding of the profession to which he belongs."

You owe part of your time—your active support and co-operation—to the upbuilding of your association, which means your industry.

Let's all get together at this convention and thresh out our problems. That's what the convention is for, and, incidentally, you will get out of it just what you put in.

Tentatively, our progress stands about as follows:

Mr. A. Hanby Jones, the newly appointed superintendent of the Division of Foods and Dairies, will favor us with an address.

Our old friend, Mr. F. W. Holmes, of Manteno, will give his ideas on "Getting Better Acquainted."

Former President W. A. Schwindeler, of Quincy, will talk about "Service" as applied to the ice cream industry.

Vice-President L. W. Roszell, of Peoria, will deliver an address on "Depreciation, as Applied to Ice Cream Equipment."

Professor H. A. Ruehe, head of the Department of Dairy Husbandry, University of Illinois, will also favor us with a talk.

Mr. Allan D. Cunningham, Chicago, will give some very interesting information about "Refrigeration."

Mr. Z. G. Gassmann, of Olney, will have some authoritative data to pass on to you on the subject of "Viscolizing the Ice Cream Mix."

Mr. Charles Snow, of Bloomington, is certainly well qualified to handle his very interesting subject—"Motor Trucks—their Care and Lubrication." The life of your motor truck depends on your care of it. Get some new angles in this connection.

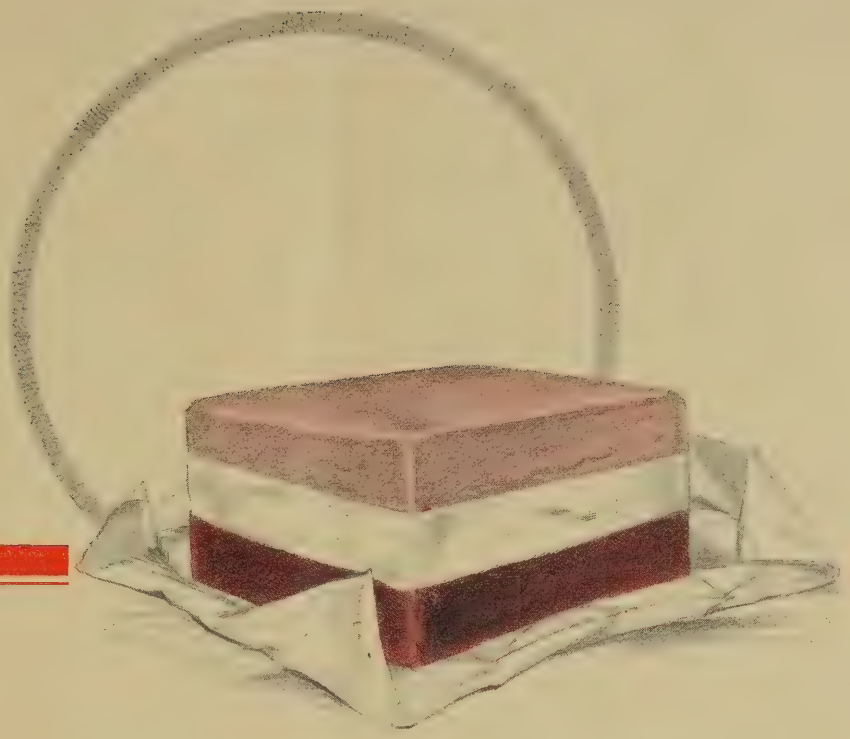
Professor A. S. Ambrose, Department of Dairy Husbandry, University of Illinois, was one of those in charge of the association's exhibit at the recent State Fair at Springfield. Professor Ambrose will make a detailed report of activities in connection with the exhibit, and you will find his statements particularly interesting.

Mr. W. W. Talcott, advertising manager of the Hydrox Co., Chicago, will give some very valuable tips in relation to "Increasing Ice Cream Sales in Winter."

We shall also have several other speakers, who will deal with subjects of practical interest to you.

The ladies are also invited to attend the convention, and all visitors will be entertained on Tuesday evening, Dec. 6th, at a dinner dance at the Hotel Sherman.

The time spent at the convention will be a gilt-edged investment. You would not pass up such an offer in other lines—don't in this.



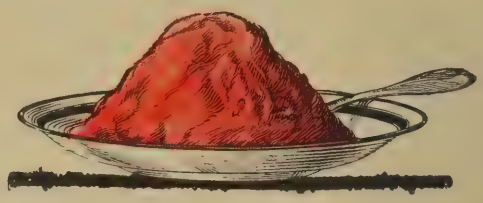
N. LOEWENSTEIN, Secretary.

There are few people who really believe that individually they will ever die.

* * *

People who amount to anything generally have all the room essential to their development.

It is most gratifying



to experience meeting our trade personally as we did at the National Dairy Show last month . . . . . We feel, now, that we understand in a far more significant way how genuinely appreciative folks are . . . . . Of course, we have always felt that B-F Flavors and Colors won on their merits . . . . . Nevertheless, it sort of "warmed the cockles of the heart" to have our visitors voluntarily tell us how much they appreciate the high character of our products and our way of doing business.

The Boerner-Fry Company, Iowa City, Iowa

MANUFACTURERS OF HIGH GRADE EXTRACTS

Ward's

ORANGE-CRUSH
LEMON-CRUSH
and
LIME-CRUSH

Ice Creams and Sherbets

greater gallonage per year

IF you can secure exclusive rights in your territory on "Crush" Ice Cream Compounds you can be sure of new and better trade, greater prestige and increased gallonage each year.

Ice Creams and Sherbets flavored with the "Crushes" are fast gaining a popularity equal to that of the famous "Crush" drinks. Each week more and more manufacturers adopt these flavors as standard. In regular daily trade, or featured as specials, in bricks or bulk, the "Crushes" are easy sellers and rapid repeaters.

The "Crush" compounds are genuine fruit flavors of first grade, imparting to ice creams and sherbets the color, fragrance and flavor of oranges, lemons and limes. They are uniform, giving you full control of flavor and color, and *will not freeze out.* With the "Crushes" no additional color is required.

Of all fruit flavored drinks in the world the "Crushes" are the best-known, most-advertised and fastest selling. The "Crush" ice cream compounds are of the same quality. When you sell "Crush" ice creams and sherbets you are backed by all the past and present advertising of these famous flavors.

The same public that buys the "Crush" drinks in preference to all other fruit flavored beverages will eagerly welcome these flavors in ice cream and sherbets.

There still remain some open territories where we will grant *exclusive rights* to manufacture Orange-Crush, Lemon-Crush and Lime-Crush Ice Creams and Sherbets. These openings are fine opportunities for trade and profit that no progressive ice cream man can afford to overlook. Perhaps *your* territory has not already been taken. It will pay you to write at once for full particulars.

For particulars about Exclusive rights, *SEND THIS COUPON*

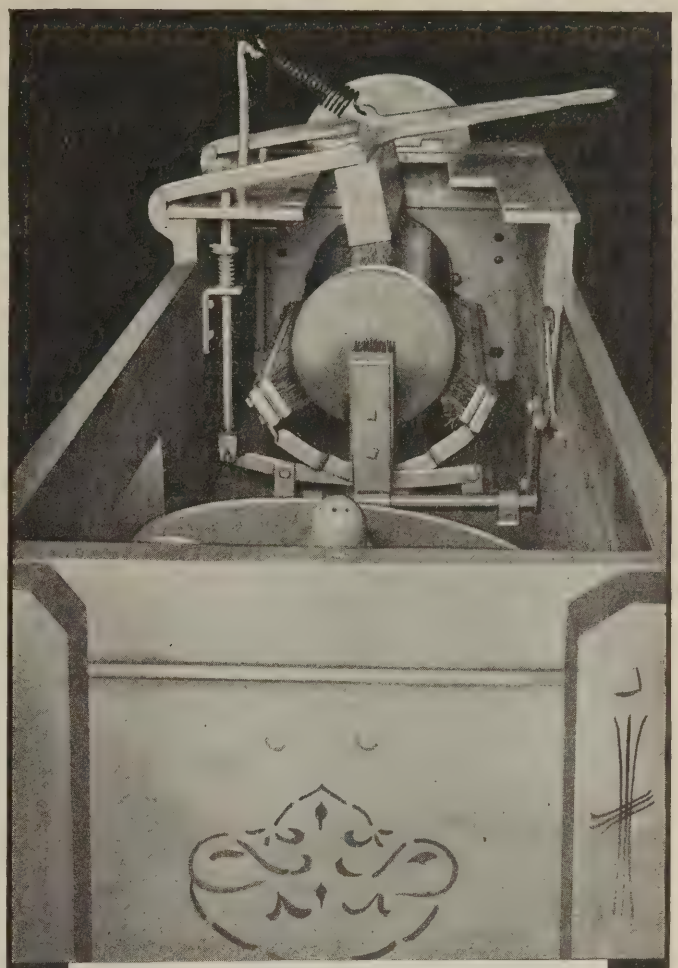
THE ICE CREAM MANUFACTURERS' ASSOCIATION OF WEST VIRGINIA.

Huntington, W. Va., Oct. 31st, 1921,



The Ice Cream Review:

The Ice Cream Manufacturers' Association of West Virginia is preparing this year, at its Eleventh Annual Convention to be held at Wheeling, November 21st and 22nd, at the Hotel Windsor, to care for the biggest and best convention West Virginia has ever staged; and the boys of The Mountain State have an individual way of entertaining their members and guests.

The officers of the association are hoping and endeavoring to have a 100 per cent attendance of ice cream manufacturers from within the state, and also a number from bordering states who affiliate with us.

Our program will be complete and the discussions will include those subjects and themes applicable to the ice cream industry, and in addition to the sober and somber part of the convention, the Wheeling committee have provided some eats, music and entertainment that is distinctive and will be dispensed in royal style. I want to insist, and urge upon every ice cream manufacturer in the state that they attend the convention.

C. F. JAMISON, Secretary.

THE washer that *grips the can*, and scrubs it clean, inside and out. And not only that, but the cans are rinsed and sterilized as well.

The patented expanding washing mechanism handles any sized ice cream can without a change.

One man and a Manning does it all.

Used everywhere because it's liked everywhere!

MANNING MANUFACTURING COMPANY

Rutland Vermont, U.S.A.

MANNING EQUIPMENT

WHO ATTENDED THE CONVENTION OF NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS?

Four hundred and sixty-two active members, representing 233 firms.

Ninety-eight associate members.

Seventy-four visiting ice cream manufacturers, representing 34 firms.

Sixteen guests.

Five trade associations.

Five trade papers.

NEW ICE CREAM FACTORY FOR BEAVER DAM.

The Storck Brewing Company of Schleisingerville, Wis., has purchased the building on Rowell street now occupied by the Beaver Dam Bottling company from R. H. Martin and in the spring will open an ice cream factory in the city of Beaver Dam, Wis.

It is the plan of the company to install packing machinery only for the freezing and packing of the cream at Beaver Dam, the mixing being done at their plant at Schleisingerville and the cream shipped to Beaver Dam for freezing.

IT COULDN'T BE DONE.

The teacher was teaching a kindergarten class and was making her pupils finish each sentence to show that they understood her. "The idol had eyes," she said, "but it could not—"

"See" cried the children.

"It had ears but it could not—"

"Hear" was the answer.

"It had lips but it could not—"

"Speak" once more replied the children.

"It had a nose but it could not—"

"Wipe it," shouted an enthusiastic pupil.

Booth 186 Grows Reminiscent on the National Dairy Show

Howard W. Black, that nice looking Widlar Company representative from Cleveland, Ohio, enjoyed the National Dairy Show, in fact, he enjoyed it to such an extent that he forgot to write to a certain address back home and he had to make up for it on the last day in St. Paul by purchasing an expensive bundle of "pink fluffies" and sending them via parcels post to pave the way for his return home.

Forrest Harwood, of the John W. Ladd Company, was very much surprised to have someone look over his shoulder on the train enroute to the show and say, "Lend me $50.00, please." But he was right there, willing and ready and immediately produced his wallet, to the great chagrin of the party who asked for the loan. But that party is wondering if a certain parlor "A" didn't have something to do with the willingness of the loan—in other words good "spirits" made borrowing easy for the other fellow. But to the rest of the world we tell the tale—we didn't take advantage of Forrest's kind offer.

D. H. GUNDRUM,
Kilner-Williams Stamping Co.,
A Dixie Flyer.

J. DEVOS,
Sethness Co.—A Dixie Flyer.

P. E. HOOTEN,
Meyer Dairy Equipment Co.
A Dixie Flyer.

C. A. Rogers, that blue-eyed son of C. E. Rogers, Detroit, Mich., in giving an account of a black eye at the National Show explained that it was not a black eye it was just a birthmark. Charlie was told that a birthmark had never been noticed before on his eye and he set out to explain that he got it by trying to get into the wrong berth on the way over. No mention was made as to whether it was a mark of violence from a brunette or a blond. We are pretty good guessers—we think it was a brunette.

John W. Ladd, of the John W. Ladd Company, of Detroit and Cleveland, was seen in the morning passing through the Ice Cream Special from the East and disappeared in parlor "A" from whence he was not seen to emerge the long day through until his exit in St. Paul. But we'll say this for him — the glorious autumn sunset lowering in the beautiful Minnesota hills had nothing on his florid complexion when he was seen to grab a breath of fresh air at Red Wing, Minn., off the back end of the coach. We imagine the air in parlor "A" was stifling—you know—a crowd of men smoking AND!!!!!!!

Harry M. Coleman, the Boston assistant manager of sales for the Essex Gelatine Company, of Boston, Mass., was first found in existence on the excursion boat en route to Witch's Gulf in the Wisconsin Dells. Of course his rolling eastern accent immediately made a hit with the ladies and from then on he was a popular man. We shall never forget what a wonderful pullman pillow this man was either—ask him for details. A humorous story you all ought to be let in on was that Harry, one dark and stormy night, in the Radisson Hotel at Minneapolis, took a "bawth" and after said bath was taken, he paused to read for a few moments, rose from his chair and took another bath—in other words he was physically made doubly pure that night—he forgot he took the first bath. Lawdy! Harry, she must have had an awful effect on you.

F. W. Babcock and his charming wife, Mrs. Vander-Bie Babcock, were discovered on the Ice Cream Special, having met the delegation from the East in Chicago. Mrs. Babcock was a very capable hostess during the Ice Cream Men's Convention in Minneapolis, and made a hit with both the ladies and gentlemen. Mr. Babcock—well we'll say this for him—at that Curtis Hotel dinner dance on Monday night, in Minneapolis, we didn't find a better dancer in the place.

C. E. Rogers, Detroit, Mich., "Daddy" Rogers to Don and Charlie, has got them all skinned for youth, vim, vigor, looks, jollity, altruism and the "pal" spirit. He's the fellow that can get up and make the speeches and the funny part of it is, he can "spooch" for an hour and never say a word about himself — that's wherein he's a wonder. Dad Rogers was the guest also of parlor "A" enroute on the special, and we have absolute proof that he held up his end of the good fellowship which seemed to abound there.

C. T. Hollinger, of the Hudson Manufacturing Company, of Chicago, Ill., was the handiest man at the whole show. In fact, we never met a man so accommo-

More Money In Every Sale

There's more *profit for you* when you sell ice cream out of an ECONOMY CABINET—because it costs you less for icing. Then it costs less in the first place and wears longer than most other cabinets, so it saves you money all the time.

"THE ECONOMY"
Ice Cream Cabinet

is fast taking the place of more expensive styles because it appeals to careful dealers. Made in mahogany and other finishes and coated with waterproof varnish. Insulation is finely graded granulated cork, protected by waterproof felt. Picture shows an Economy Metal Lined Cabinet. Made in from one to four compartments, 12 to 20 quarts. Ask about "Economy" Packing Tubs.

Write or wire for catalog and prices. Prompt shipment if you order at once.

HOMER MFG. CO.

HOMER CITY PENNA.

dating—and he likes the ladies, too. He may not know beans about the proverbial "Boston beans" but he knows vanilla beans to a fare-the-well, at least that's what we heard one lady report.

W. J. Northgrave, managing director of the City Dairy Co., Ltd., Toronto, Canada, was at the Show. They sure make them prosperous looking in Canada. Mr. Northgrave has been with the company for several years, has stuck with them through adversity as well as prosperity and has finally reached a very fine position. A crew of his plant managers were his guests at the National Show and a pleasant trip is reported by all. Mr. Northgrave made an excellent host at a dinner party given at Sheiks in Minneapolis on the evening of his return to Canada. The party was sorry to lose his company at an early hour, due to his return home.

Harold M. Gully, right hand man of Mr. Northgrave of the City Dairy Co., Toronto, Canada, paid his respects to booth 186 and brought with him something which will always be cherished by the recipient. If any of you fellows ever meet Harold down this way again, don't forget to ask him how he enjoyed the scenery on a beautiful moonlight night when an auto excursion motored out the Fairbault road. We are with him in saying it was as enjoyable as any evening we ever spent, and our only regret is that it does not come oftener.

Robert Harbison, of the Patterson Parchment Paper Company, was one of the fellows who wore that cane to perfection which was given away at the Sharples booth for a souvenir of the big show—dear me, that man certainly knows how to dress. Booth 186 was all smiles when Bobbie came that way and brought that Georgie Mayer, of the Paterson Company, with him. Each time they handed that temperature taker, the most popular souvenir at the whole show, given out by C. Doering & Sons, Chicago, to the light complexioned part and the dark complexioned part of 186, the thing registered "Furious". So they know how they stand in that locality.

C. A. Gates, of the King Ventilating Company, of Owatonna, Minnesota, must have sold lots of ventilators during the Show—at least, if he only had the chance to sell them to ladies we know the company would have had to build larger quarters to fill the orders—for he was the perfection of gentility, immaculateness and everything that was good looking and nice. Our only regrets are that we did not have the opportunity of tripping the light fantastic with him, for we heard he was excellency itself at that art, and that they built Owatonna, Minn., so far away from Milwaukee. We hope we see him again sometime.

Don Rogers, the brown-eyed son of C. E. Rogers, Detroit, Mich., was THERE at the show—you know, we'll say he was. No wonder the Rogers booth was so popular at that show, when Dad Rogers can produce products like Don and Charlie for exhibition in his booth, the stuff ought to sell, and it did too, they did a rousing good business and no wonder. If you ever get stuck, boys, and want to think up a good fib for ditching a dinner party when you think there is too much "Helen" it—ask Don—he knows. We liked him better for it too. Much more prosperity and success to you, Don.

C. G. MEYER,
Meyer Dairy Equipment Co.,
A Dixie Flyer.

C. S. MORRIS,
Blanke Baer Extract & Preserving Co.—A Dixie Flyer.

W. PAUL HEATH,
A Good Prospect.

Chas. W. Russ, of the Crown Fruit and Extract Co., Inc., New York City, was at the show, kittie-corner from 186 and he wasn't hard to look at either. In fact, when all other wiles failed in the procuring of one of the Dunn key ring souvenirs, Charles came to the rescue and got one for us. We feel that he must be the boy who put the Crown in the Fruit and Extract Company and we hope he pays us a visit soon, as he promised.

David C. Babcock, sales manager of the Atlantic Gelatine Co., Woburn, Mass., occupied a booth on the mezzanine floor. David likes good eats and we'll let you in on a little story. A fine dinner was all spread out on a dainty table in an adorable booth at a certain Mandarin not far from the Radisson in Minneapolis. David was all set for an enjoyable repast and up the wall came Mamma Cockroach, Papa Cockroach and all the little Cockroaches in an unbroken stream. Of course part of the party squealed and part of the party had to be heroes and in order to forget his disappointment, David got up and and danced. He says they grow them lots larger in the North than in the East. Ask David, you fellows who bump into him, if he ever regretted that the took that "nip" in Mandarin No. 2.

To Make Sanitary Ice Cream

There is No Machine so Easy to Keep Clean and Free from All Contamination as the

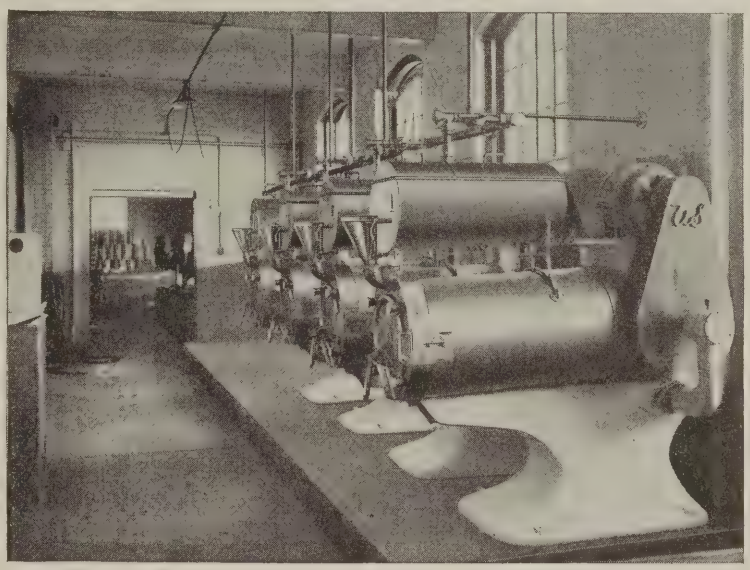
U. S. Heavy Duty Freezer

CLEANLINESS is an important factor affecting the flavor and consequently the sale of ice cream. No matter how good the quality of the materials used, a large quantity of ice cream may be spoiled or acquire a very bad flavor because of small traces of material remaining in the machine to sour and decay after the preceding day's work was done.

The greatest care has therefore been taken in the design of the U. S. Line of Heavy Duty Freezers to make them in every respect easy and convenient to clean and flush out.

Fruit and cream passages and valves are made large, simple, and easily accessible.

The hinged cover, which is now standard on all sizes, eliminates the danger from contamination on account of laying it on the floor. It is always in a position convenient for washing at the time that the cylinder is flushed out.



There is no connection between the front end bearing of the whipping device and the cover of the U. S. Heavy Duty Freezer. The advantage of this is readily seen. It makes removing and replacing the cover so easy.

By the use of the improved drive, the difficulties ordinarily attending the removal of the whipping device for cleaning are eliminated. No parts of the shaft bearings or bushings are exposed or pulled out when removing the whipping device, and there is therefore no possibility of polluting the inside of the machine with dirty oil.

To clean the cylinder and whipping device after the day's work is done, the cylinder cover is unlocked by simply turning four milled hand nuts requiring no special tools whatsoever, and is drawn away from the cylinder head and swung back on its hinge. The patented removable bronze bearing and support for the front end of the dasher is easily slipped out, and the whipping device —spaddle and scraper combined— is pulled out after turning it back about a sixth of a turn to disengage it from the driving shaft. If desired, the dasher of the whipping device may be separated from the scraper yoke by merely slipping out a hollow bushing.

Everything to promote saving labor, time, space and power has been embodied in these up-to-the-minute freezers. No other machines are so easy and convenient to handle, so reliable, so economical in power, so durable, so saving in space. On account of their simplicity of operation, they do not require such skilled, high-priced labor to operate them as old-fashioned freezers do. With the larger sizes the same labor may turn out considerably more ice cream with U. S. Freezers.

U. S. Heavy Duty Freezers lower the cost of manufacturing ice cream, and will help both the small and large manufacturers to meet all competition without lowering the quality of their ice cream.

The Experience of a New England Manufacturer with U. S. Heavy Duty 100-Quart Ajax Freezers

IN the plant of the Main Creamery Company, Providence, R. I., where the photograph herewith was taken, they have installed altogether 4—100 quart Ajax U. S. Heavy Duty Freezers. They first installed one U. S. Ajax 100 quart Freezer on trial, and after fair tests of this put in the other three. This installation is therefore the result of the good service rendered by their first U. S. Heavy Duty Freezer. In a recent letter to us regarding these freezers, they say, "They are very satisfactory—do more and better work than we anticipated." They say further that the only "Trouble?" they had was in **keeping down the swell!** This of course, was easily overcome by regulating the brine.

U. S. FREEZER & MACHINE CORPORATION

Union Avenue and Frost Street **BROOKLYN, N. Y.**

May we not arrange to have one call on you?

Jack Hickey, the Chicago man for Elyria Enameled Products Company, of Elyria, Ohio, was a busy boy at the National Show—wow! boy! if this son of Erin could only have sold to ladies instead of men, Jack would have sold more of those milk trucks displayed in their booth than the entire truck companies of the United States sold to the government during the period of the world war. No. 186 didn't have a blow-out with the Elyria booth, but we heard that young Andy Green (the inventor of the Green Gauge) and "Hickey Bub" broke several hearts over in Minneapolis during the course of the week. The Elyria boys put up at the Minneapolis Athletic Club and reported fine treatment there. We hope Jack doesn't forget our telephone number is Grand 764 when he gets to Milwaukee, for he sure is a sight for sore eyes and we saw so much at that show that we have been sightless ever since. Page the eye doctor.

R. E. McFarland, the "big boy" Chicago representative for the Essex Gelatine Co., of Boston, Mass., was not on the Ice Cream Special going over to Minneapolis, guess they were afraid to let him on when they thought of Parlor "A," so they sent him ahead to the city to meet the delegation. Someone was heard to ask Mac one day if he had anything on his hip and he was heard to reply: "Naw, nothin' but a pimple." But whether he was on the special or not, he wasn't forgotten for at least half a dozen introduced us to him by telling us about him and we want to tell you, when we met him—well, he sure came up to expectations. Mac traveled around our way one day with John Mulholland and we noticed quite a crowd followed them away—suppose they were trying to locate where they got "it."

C. L. Berger, sales manager for the York Milk Machinery Co., York, Pa., played some joke on booth 186, but anyhow, the line of talk he got back told him just what the demonstrator thought of our magazine. He knows his firm is advertising in the right paper and he still owes us a box of candy for the way he fooled us; not that we admit that we are easily "strung," but this chap looks as solemn as an owl and we began to think first crack that he was a "feeler" until one of those well-known grins broke over the sedate countenance and spread sunshine where we thought shadows lurked, and honestly, if we hadn't liked him so well and had had a cabbage handy, we would have sure enough flung it at his head for fooling us.

Fred Morris, St. Louis man for the Elyria Enameled Products Co., of Elyria, Ohio, was there in a pretty nifty gray checked suit. We thought at first he was a demonstrator for Kuppenheimer, but we really found out that he has an honest-to-gosh job with Elyria—my, the thought of those "fashion plate" boys in that booth makes the heart in us beat faster—and they were darn nice chaps, too, all of 'em. A novel device in their booth was a phonograph which was hitched up to an electric current connected with a big tank, and one night, shuh, don't speak above a whisper, booth 186 danced with the Apollo Freddie, and pink snakes and purple rabbits, could that boy dance! We expected it of him anyhow; somehow you could just tell from his looks that he could dance. Hope we see him again some time, and he's going to get that handkerchief we promised him, too.

E. H. Huesener, general manager for the Universal Motor Co., Oshkosh, Wis., was up in the corner on the mezzanine floor with his Unimote outfit. Did a lot of business, too. Did you ever meet a tall, nice looking young man who wore his clothes well and had a dear little Cole 8 sport model and a house boat and loves hunting, etc., up Oshkosh way, girls, and not fall for him? We did, and hard. He left us before the show was over, but he came to say goodbye—somehow or other we just hate that word goodbye—it's awful hard to say sometimes. Thanks to the God of Favor, Oshkosh is quite close to Milwaukee and we expect to see him some time in the near future. Ask him, boys, if he thinks he would enjoy a nice duck dinner on a houseboat—then tell him to get busy and invite us to one.

Herbert Barrett, of Hoard's Dairyman, Ft. Atkinson, Wis., came over on short notice and got acquainted with 186 and we want to say that he had the crowds around his attractive booth, and we don't blame the buyers either. It's a fine paper and deserves a big circulation, which we know it already has. He always had some sweet hidden in his pocket for the fair sex and it was muchly appreciated. We almost lunched with him one day and then something happened and we were the ones who were cheated by losing his company. When it comes to the point where a man can sell to another man without any trouble, you know he must be good.

Write us for your Requirements.

SPECIALTY BRASS COMPANY

KENOSHA, WISCONSIN ALBION, NEW YORK

We wanted him to invite us to come over to his booth to play with that cute little exhibit of a dairy farm he had there and we don't know whether or not we would have left those papier mache cows intact or not, for they were enticing enough to "swipe." Another nice thing Mr. Barrett did was to bring us the pleasure of a personal visit from young Hoard from Ft. Atkinson, who sat down for a few minutes for a pleasant chat.

Walter and Howard Cherry of the J. G. Cherry Co., Cedar Rapids, Ia., were there strong with their able salesmen and they had lots of floor space and they did lots of business—wonderful stuff they had, too. "Abe Lincoln" Cherry helped the tyro in her interview with Gus Ludwig, for which we wish to thank him. Abe Lincoln was a wonderful man in history, but we think Walter Cherry is just as wonderful only he has the handicap of not being quite as nationally and historically known as Abe, but we feel sure that if the Cherry equipment keeps on selling as it did at the show, he will go down in history yet. Walter and Howard may be named "Cherrys," but we think they are really "peaches." 186 sends their regards to that particular salesman who faced our booth—we didn't get his name—careless of us, too—but anyhow we liked him.

Jim "Goo-goo" Simpson of the Elyria Enameled Products Co., is the boy, did you meet him? Well, you missed it if you didn't. We bet all the girls met him—if he couldn't throw the goo-goo eyes through those horn-rimmed glasses no one ever could. And wait! Did you see the steps they had built up real high to that milk truck? Well, goo-goo was seen to strain one eye one evening when some of the inquisitive fair sex climbed thither to see it from the "outside in." Wonderful truck that—see it? Ask Sim where he got the pen he carries so guardedly in his inside pocket. See if he answers with a roll of his eye and then tell us all the good things he says about the member of 186 who is in some way or other connected with the story.

Wyandotte, the J. B. Ford Co., of Wyandotte, Mich., had some booth, all decorated up, with a real live Indian for attraction. The Indian sent a ring over to our booth to our brunette one day—guess her hair was so black he thought she belonged to the light-footed race. That nice blue, and that nice black-eyed salesman from the Ford booth were frequent and constant visitors over at 186 and we like the pins and feather pens they brought to us. We treated the rest of the office force with souvenirs from Fords and they liked 'em. We met Mr. and Mrs. O'Brien, too, from the Ford Co. Nice people, both of 'em.

Jas. A. Fisk, the manager of the Butter Department, with headquarters at St. Paul, Minn., for the Great Atlantic & Pacific Tea Co., was just the nicest big man at the show. He certainly treated the fair sex right at 186. On Tuesday at the show he brought over the customers and all we had to do was sell subscriptions as fast as he brought the victims—but it's all right, they all got a smile free with every subscription and a dinged good magazine besides, so they all got value received. And you know, the day after when Mr. Fisk was missing, business got so dead for a few minutes that we yelled "Prescription" for sale, and you ought to see the crowd we had in a minute's time.

A. L. Baylor, manager of the Engine and Boiler Department for the James Leffel & Company, Springfield, O., will never be forgotten by the light complexioned part of the booth—he's a man of his word and he gave the advertising tyro therein a nice order and it was greatly appreciated, too, for it instilled pep and encouragement therein and the tyro straightway stepped forth from 186 the next morning and sold $1,000 worth on the strength of the encouragement of Mr. Baylor. We think the Jas. Leffel Company have in their personnel an invaluable man in Mr. Baylor—a man of personality and a man commanding the respect of all who know him.

C. J. Bruns, Sales Manager of the Toledo Bottle Cap Co., Toledo, Ohio, was a valuable party to meet at the show—do you know why? Because they gave pens away over there at their booth that were about the nicest souvenirs at the whole show. We'll say, as a message from 186, that she's no piker—we don't want to give her away—but we think her a pretty liberal and good-hearted lady and we'll see that they get those extra copies of our publication that were promised them—one good turn deserves another—and say, by the way, we never wrote with a nicer pen and we think of C. J. Bruns every time we use it, which is almost every minute in the day.

W. B. Wenham and his charming wife were the star furniture people at the National Show. Wenham is a good sport, he helped the novice along in the advertis-

ing line and showed his good spirit and intentions. We'll say this for Wenham—he can either make a party or break it—ask the Roger boys if you don't believe it. A large percentage of the furniture in the booths at the show was furnished by the Chicago Safe and Merchandise Co., with whom the Wenhams are connected.

Melbourn Goodwin, of the Elyria Enameled Products Co., who is the Detroit representative for that concern, just caused the members of 186 to sigh when they looked him over. Wasn't he the clean-cut youth, with the prettiest teeth, and the best looking clothes, and we even liked the way he wore his watch—snap—class—just a darby, that's all. We all wanted to claim that Ford ride before he got away, but we never had the time to get it, for we were a pretty busy booth during the day, and somehow at night, some other girl must have got him. We don't blame him, but it makes us jealous just the same. We sure hope we see him again sooner than that.

Andrew H. Green, of the Green Gauge Co., of Chicago, Ill., was sticking around between the Elyria and the Mojonnier booths. They are going to market the gauge for young Green and it was a peach, too—ought to go big. Andy is a good looking youth, very clever (you all must know that for he invented the gauge), and has pretty hair, although it is getting to the point where he has to use discretion in parting it. On the last day of the show Andy was so tired that he almost forgot his "brought up" and (nearly) peacefully slept while there were ladies in the Elyria booth. We hope he has unlimited success on his invention and we'll give him a boost whenever we can.

Roscoe H. Shaw, manager, Scientific Department of the Louis F. Nafis, Inc., Chicago, Ill., had the booth next to ours. We have come to the conclusion that he must be a smart man to be able to tell all those little tubes

Part of the Massey & Massey Force.

Gus Ludwig, manager of the Butter Department of the Great Atlantic & Pacific Tea Co., Jersey City, N. J., was there life size. Of all the Elks we ever met in our lives we think he is about the nicest one. He's got a beautiful diamond pin, wonderful Elk's tooth charm (about the prettiest we have ever seen, that he dug up himself in the west), and a darling set of diamond cuff links, but he's got a sweeter smile and a more charming manner than any of the men we met at the show who are over 35 years old. When you meet him, boys, kid him along about something that took his eye in booth 186. If he tells you, it's all right, if he doesn't, you'll never know.

W. P. Heath of the Heathmade Carbonated Products Co., Chicago, Ill., paid us a visit at 186, but we were sorry that we didn't know him when he appeared in front of the booth. He's one of those men who goes about in an unassuming manner and does not let you know that he is a really great man. At any rate, we wished we had known before he left us, who he was, for we would have liked to thank him for the lovely dishes of "bully" ice cream that a nice young fellow over in the corner, where they manufactured ice cream all week, brought to us and it was Heathmade Carbonated Ice Cream, too—guess that was why it was so lickin' good.

apart—they put us in mind of our chemistry class back in high school days when we never had our lesson down "pat" and shivered in our boots for fear the old "prof" would call on us and we didn't know the answer to what took place in an experiment we had just finished. We made an awful mistake concerning marital affairs that wasn't solved until almost the last day on board ship. Ask him what it was and watch him laugh.

Charles B. Goudey, sales manager of the Allen Candy Co., Pontiac, Mich., was one of the most popular men at the show—but, between you and me, if he'd have brought samples and distributed them promiscuously throughout 186 and otherwise, he'd have been superpopular. He came to our booth and said, "Don't smile at me, I'm a woman hater." The Brunette said, "So am I." And straightway he changed his mind. By the way, Charles was in that same Mandarin where we thought it was going to be our party until the cockroaches invaded and made it their party instead. If you run across him, ask him if he practiced any of the steps he saw at a certain dance emporium on Wednesday evening of the Dairy Show week, and if he looks out of joint you won't have to ask him, for you'll know he's been practicing them all right.

Custards *Flavors*

Maraschino Cherry Custard
Mothers Egg Custard

"Acme" Custards	An exact reproduction of the EGG or CHERRY.
Egg or Cherry	Contains all of Nature's delicate FLAVORS and BLENDED COLORS. A delicious Ice Cream of quality distinction. Working sample for 40-qt. freeze, 36 cents.

W. P. Abel, president and manager of the Impruv-Mix Company, New York, N. Y., came around every little while to "rest his eyes" at our booth. Incidentally he came often and stayed long and gee, we were glad. One day we overheard him invite a certain pretty matron in our booth to take dinner with him at the "damage sheet" pavilion and said lady had to decline on account of having had a previous engagement. We sighed and wished he had asked us. But lo and behold, he came back again another day and that time we fell for the invitation. Well, the outcome of it was, that he was a good waiter, but not good enough, for the boss didn't show up for two hours that day and the "getting hungrier every minute" specimen of health had to miss the pleasure—but we'll give him this much credit—he waited an hour and a half and then gave up in despair to the wailings of his stomach.

Mike Conant, of the John W. Ladd Company of Detroit and Cleveland, got a fine start for the National Show on the train in parlor "A" with the rest of the gang. He's a gretty good looking fellow and he made

C. R. Fairbairn, manager of the Blackmer Rotary Pump Co. of Petoskey, Mich., was on the mezzanine next to Bristol. Nice dark-eyed chap, too, and we wish we could have his wish about the advertising we spoke about and we won't be a back number if we can help him out in any way. We just feel that if a lot of these chaps we met were only the advertising managers instead of salesmen, presidents, vice presidents, secretaries and what-nots, all on their way up the ladder of success, we would have had to buy one of those trucks on display to carry home the orders we would have captured.

Jim Nelson, son of the C. Nelson Manufacturing Company, St. Louis, Mo., was first spied on Sunday afternoon on the mezzanine. We looked askance with wonderment in our minds as to who the distinguished, ministerial personage might be. But you know—it was mutual—for five minutes afterward we knew it was Jim himself. Somehow or other we had a dance booked with him at the dinner dance at the Curtis, but we got lost in the crush and didn't find him until next day.

an excellent rival for a few others 186 met on the train. But he stuck to the ship gallantly and he made rather a good showing when he got off the train at St. Paul. We guess it's because he's used to the gaff and he isn't a bit of a give-away to himself. He handles packages and sales nicely and being so gifted he ought to be an asset to the firm.

F. K. Merkley, of the Saginaw Dairy Products Co., appeared at 186 one day and we're a "holy, pink-toed prophet" if he didn't walk away unconquered. What do you think? Did you ever meet a fellow that you just thought must have a nice smile hidden around the corners of his mouth somewhere and then just itch until you saw it break? Well, "Goodie" Elyria brought him back next day and we'll gently murmur that that boy fell that time. He renewed his subscription. Still again a third day he didn't cheat at all, he just smiled often and oftener and then he knew for sure we liked him fine.

L. L. Greeley, of the Bristol Co., of Waterbury, Conn., was on the mezzanine floor and if you didn't meet him you missed the polite, convincing talk this rising young salesman gave on electric pyrometers. He called at the booth and bid us goodbye and we'll say for him, he's all business (even though we wish he hadn't been every minute) and he'll get there.

W. W. Birnstock, general manager of the York Manufacturing Co., York, Pa., stopped at 186, picked up a copy of The Milk Dealer and said, "Best and most comprehensive dairy paper in the world!" That was music in the boothkeeper's ears, and although she didn't know at the time who the donor of such a good-sounding statement was, she soon found out and put it down on her "pier of memory" for future use to which she is now putting it.

John Mulholland, of the John H. Mulholland Co., Philadelphia, Pa., was there. Did you see him? We did, and oh, boy, he was having some time, too! We are still wondering where he got it. He came to our booth one afternoon and they don't perform that operation any better in France when they pinned on the Croix de Guerre, only his slipped a little from the cheek and landed on a dusty neck (you see it was the latter part of the afternoon and that's the condition we found most necks to be in at that time of the day). And say, we met him in the Radisson lobby one night and he stopped to tell us a sad, sad story of how his friend had bought an expensive hat for his wife and she walked into the lobby and no one looked at the hat. Of course, woman fashion, she was bitterly disappointed for she had sunk a few iron men into that bauble. To her husband she

BUFFALO EXPOSITION A BIG SUCCESS.

More Exhibits and a Larger Attendance Than Ever Before.

The Buffalo Exposition, put on by the Association of Ice Cream Supply Men, Oct. 30 to Nov. 5, was the best in all particulars ever held by the Association. Elmwood Music Hall was an ideal location and the show was artistic as well as complete.

Ice cream manufacturers were in attendance from many states, and a liberal number came from Canada. The different entertainment features were well attended and enjoyed. The complete list of exhibitors is as follows:

H. H. Miller Industries Co., Canton, Ohio.
Commercial Truck Company, Hunting Park & Rising Sun Aves., Philadelphia, Pa.
Baeder Adamson Company, Philadelphia, Pa.
Wolf & Lavenson, Mt. Vernon & Fifteenth Sts., Philadelphia, Pennsylvania.
Emery-Thompson Machine Co., 271 Ryder Ave., New York.
Ward Motor Vehicle Company, Mt. Vernon, New York.
Auto Car Company, Ardmore, Pa.
The Glacifer Company, 102 Merrimac St., Boston, Mass.
G. R. Ryan Mfg. Co., Rochester, New York.
John J. Grothe Co., Woburn, Mass.
Grand Rapids Table Company, Grand Rapids, Michigan.
Sealright Company, Fulton, New York.
Ivan B. Nordhem Company, 8 W. 40th St., New York.
Mojonnier Bros. Co., 739 W. Jackson Blvd., Chicago, Ill.
Cherry Bassett Company 1106 Arch St., Philadelphia, Pa.
Wolf Advertising Company, 43 W. 36th St., New York.
Sanitary Tinning Co., 3757 E. 93rd St., Cleveland, Ohio.

HIGH grade work at reasonable prices. Send us a sample of what you want and we will quote you prices.

THE OLSEN PUBLISHING CO., 210 Sycamore St., Milwaukee

WHAT are you doing to make the women congratulate your dealer on his ice-cream and his service and his up-to-dateness?

It certainly gives the drug-store man a nice, warm glow around the heart when a woman steps into his store and says: "You've got us all into the habit of eating ice-cream right through this cold weather!" or makes some other comment of appreciation.

And he knows that he owes it to your co-operation and creative salesmanship because he couldn't possibly afford to work up the ice-cream appetite in his neighborhood unless you got behind and pushed.

There is a Mathews way of getting the women doing this very thing; no hot-air about this statement; we've already accomplished it in some cases where the ice-cream manufacturer himself wasn't what you'd call a live-wire.

So—what could we do for you? Echo answers *"what?"* Let's do it! And *now* is the Accepted time! Write us today when you'd like to see a Mathews man.

ICE CREAM A PRODUCT OF HIGH FOOD VALUE.

The following article was written for the Milwaukee Sentinel by Stuart T. Todd, milk and dairy sanitarian, who has just completed an analytical survey of conditions affecting the ice cream supply especially as related to sanitary conditions and methods employed in handling. The article has been written with a view to the encouragement of greater consumption of ice cream.

"Ice cream, 'a food, not a fad,' is a product the high food value of which is not sufficiently well known or too often ignored. It, like milk, is cheap in Milwaukee, ranging from 10 to 25 cents cheaper per gallon wholesale than in most other cities. In butter fat content it is richer than the average, state law requirements assuring a product of at least 12 per cent. Other states are as low as 8 per cent, and the prices are considerably higher. Yet this year's ice cream consumption in Milwaukee will be almost a gallon per person less than during 1920.

Blame Retailers for Price

The retail dealer to some extent is responsible for this shrinkage. The manufacturer long ago recognized the tendency of the times toward price reduction and when the cost of raw material to him was shaded he almost immediately passed it on to the dealer. But the dealer was backward in letting the consumer in on the reduction. Only recently has any perceptible decrease in retail prices been shown here. This has had a tendency to hold back consumption, the public refusing to buy as formerly at prices it believed unwarranted.

Many people look upon ice cream as a confection, losing sight of the fact that it is one of the most wholesome and desirable of foods. Too many mothers discourage the "ice cream habit" in their children, because they do not appreciate its value as a builder in youth. Every child should be given as much ice cream daily as it will eat. It will save "piecing" and aid vigor and growth, at the same time cutting down the necessity for other foods of less nutritive value and more expensive. As a desert ice cream tops off the meal with a wholesome and delicious dish, and the housewife, by using it more frequently on her table, will lighten her labors and reduce her household budget materially.

Ice cream in the quantities designated below equals in food value any of the portions of foods shown, and contains in addition a vital food substance essential to growth and health not found in others except eggs and milk:

	Ice Cream (1 quart)
Beefsteak (round)	1 2/3 pounds
Chicken	3 3/4 "
Ham	4/5 "
Eggs	14 "
Codfish	3 4/5 "
Beans	1 3/4 "
Peas	4 1/3 "
Tomatoes	10 3/4 "

Expenditure for Food

	Now (pct.)	Should be (pct.)

Petersen's Ice Cream Gain Indicator

Patents Pending

A simple and reliable device for determining the freezing gain or "over-run" in ice cream

A tester of exceptional value as a means of checking freezer efficiency. Shows deficiencies caused by improper refrigeration or handling of mix. Under normal conditions it enables ice cream makers to control freezing gain in accordance with solids content of raw material,—producing a finished ice cream uniform in texture and food value.

Absolutely fool-proof. No adjustment to make. Easy and quick to operate.

The durability, simplicity and reasonable price of Petersen's Ice Cream Gain Indicator entitles it to a place in every ice cream plant. **Fully guaranteed as to materials, workmanship and efficiency.**

Condensed and Evaporated Milk Market Report

By Bureau of Markets and Crop Estimates, U. S. Department of Agriculture.

Manufacturers Wholesale Selling Prices of Condensed and Evaporated Milk (October)

The wholesale prices given below are based on reports made by manufacturers covering actual sales of condensed and evaporated milk to jobbers, wholesale grocers and similar buyers, delivered at manufacturers' distributing points on basis of cash or short time credit. Foreign prices are given as F. O. B., or F. A. S., points of export in section in which sales were made.

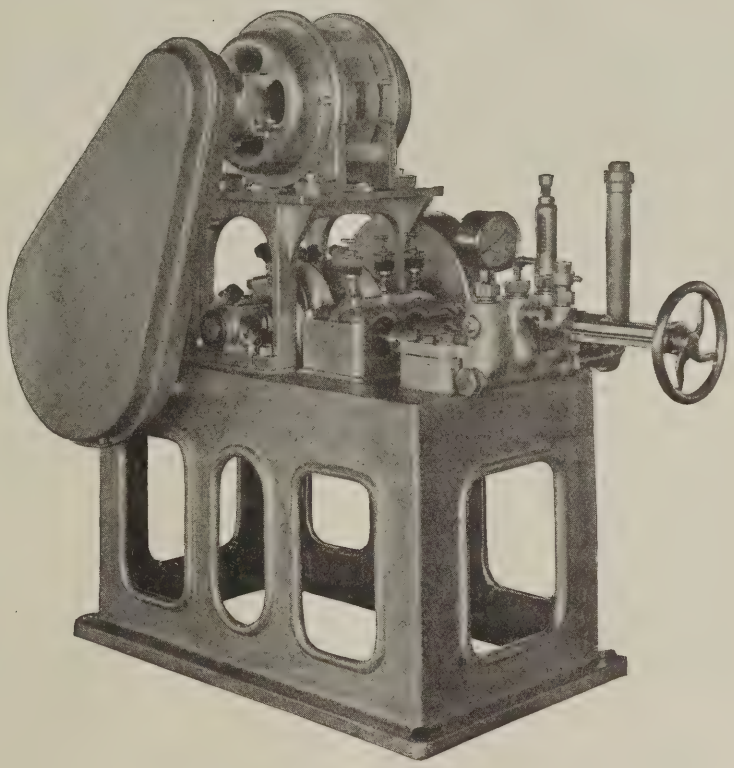
CONDENSED AND EVAPORATED MILK FACE LIGHTER DEMAND.

With export business a diminishing factor and domestic demand offering comparatively little support, condensed and evaporated milk markets have again assumed an unsatisfactory position. This growing lighter demand, in the face of quite heavy supplies accounts for lower selling prices which during September were reduced to both foreign and domestic trade. But with prices for milk used in manufacturing remaining practically unchanged, even up through the current month, per case costs have been relatively higher and some manufacturers report that prices quoted were almost at cost. The heavy export movement during August and September was largely composed of shipments for relief purposes, and it is stated that practically the last of these orders have been filled or will be filled during October. Other export business has assumed small proportions compared with what many dealers have expected, and the general situation is not regarded as encouraging. It is expected that the more commonly known brands will be the last to feel the pressure of the dullness which appears prevalent.

August and September Exports Heavy.



Evaporated milk again constituted the bulk of exports during September, and total shipments of this class of goods were 6,000,000 lbs. heavier than during August. September movement of evaporated milk into export channels amounted to almost 29,000,000 pounds, over three times the amount of condensed milk shipped from domestic ports. The excessively heavy movement of evaporated goods is said to be due to sugar prices, which in Europe, where beet sugar is obtainable, are relatively lower than in this country. By purchasing evaporated milk there is a saving not only through a lower per case price, but also because of the absence of sugar which can be supplied cheaper and without the addition of freight costs. European countries, the United Kingdom, France and Germany were the heavy receivers of both evaporated and condensed milk during September. The combined exports for the first nine months of this year were over 137,000,000 lbs. less than during the same period in 1920, and it was only during August and September that this year's movement was heavier than corresponding months a year ago.

Stocks Backing Up.

Statistical reports from manufacturers confirm what has been said regarding the general condition of the market. While the latest available reports of stocks are as of October 1, current comment suggests no material

(Continued on page 60)

"—My Gaulin Homogenizer has worked long hours every day *for 10 years*, and I wouldn't change it now for a new one of another make"

IT'S not unusual for a Gaulin Homogenizer to be in active operation for ten years or more. Such plants as Abbotts Alderney Dairies, Philadelphia; Ives Ice Cream Co., Minneapolis; Tait Bros., Springfield, Mass.; McBride Bros. and Knobbe, Chicago; Waterloo Ice Cream Co., Waterloo, Iowa, and many others have used their Gaulins and kept them mighty busy for more than ten years each, and the machines are as efficient as they ever were. And their upkeep costs have been negligible.

Although it is not surprising that a Gaulin Homogenizer lasts indefinitely, considering the fact that it was properly designed in the first place and then made of the best material by skilled workmen, yet it is a fact that other machines purporting to do what the Gaulin does are ready for the scrap heap in 3 or 4 years' time.

In addition to giving long service, the Gaulin turns out superior goods. Each particle homogenized must pass through the Gaulin Spring Homogenizing Valve, which crushes it under pressure of 3000 lbs. Furthermore the spring valve feature prevents clogging of the valve as is the case with rigid spring machines.

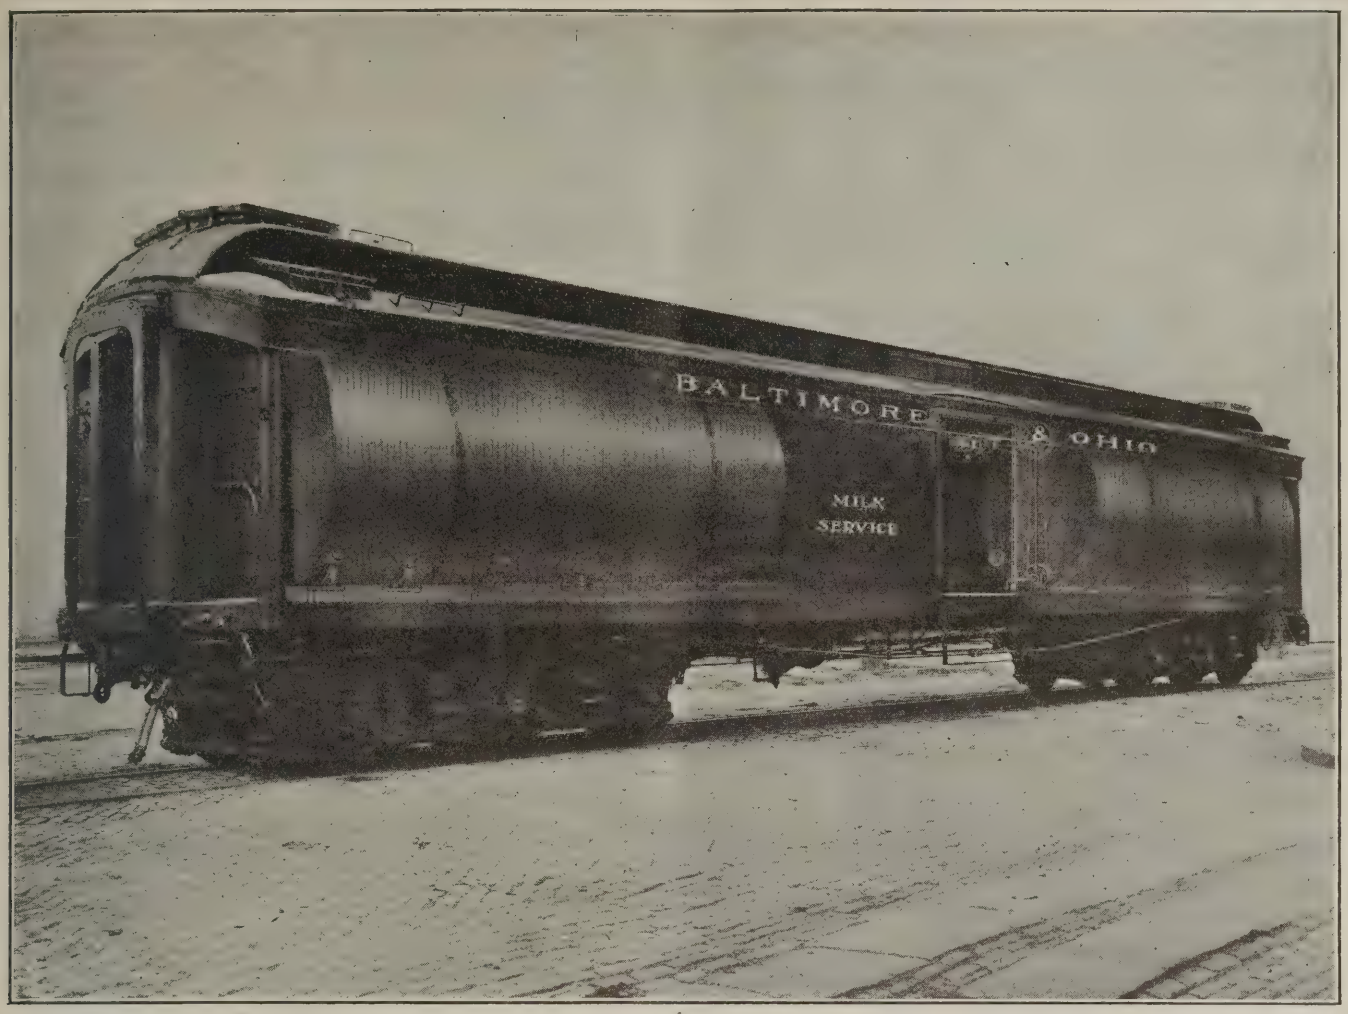
CONDENSED AND EVAPORATED MILK FACE LIGHTER DEMAND.



(Continued from page 58)

improvement in the situation. On a comparative basis October 1 stocks of all classes of goods were lighter than the previous months. This would be expected following the fairly heavy movement during September, and the seasonal decrease in production. But the fact that condensed goods were sluggish even during September is shown by the fact that stocks of this particular class increased slightly during that month. Manufacturers' unsold stocks also increased during September, and unfilled orders decreased. These statements apply principally to case goods, as bulk goods manufacturers, many of whom depend more or less upon local or nearby demand as an outlet, carry much smaller stocks in reserve and have more of a tendency to divert raw material into other products when the market begins to show signs of becoming stagnant.

"Wot was the last card Oi dealt ye, Moike?"

"A spade."

"Oi knew it! Oi saw ye spit on yer hands before you picked it up."

Phantom view of one of three Pfaudler Tank Cars, used by the Harmony Creamery Co., Pittsburgh, Pa.—One of these cars was exhibited at the National Dairy Show.

Do you want to Reduce your Transportation Costs?

Undertaking to find some effective means of reducing Transportation Costs, the Harmony Creamery Company of Pittsburgh consulted Pfaudler. The result was the new type of glass lined tank car, which has proved so successful in operation.

This dairy will save at least $53,000 during the first five years that they use these Tanks. Note the following outstanding features of this installation:

1. They now use only three cars instead of seven to handle same capacity formerly handled in cans.
2. Loss of only 2 degrees Fahr. temperature in a run of 106.7 miles with thermometer at 88 degrees, for a period of 8 hours.
3. Enormous saving in refrigeration, as initial cooling is only cost. Maintains low temperature, with no refrigeration expense en route.
4. Has thus far done away with services of seven men, and one 3½-ton truck, formerly used to haul cans to railroad cars. The Company further expects to do away with two more men; and labor expense saved here in one year will approximate two-thirds the cost of car tanks.

The engineers who solved Harmony's problems can be of equal service to you.

Car Tanks, Truck Tanks, Pasteurizers, Storage Tanks, Starter Cans, etc.—whatever your interest, write us. There is no obligation.

An Interesting Exhibit

Mojonnier Bros. booth at the National Dairy Show was headquarters for visitors interested in the new development along dairy manufacturing lines. They exhibited the following items:

Mojonnier Vacuum Condensing Unit for condensing milk in the vacuum pan and for making the mix at the same time; Mojonnier Ice Cream Brick Packaging Machine for packaging one, two and three layer ice cream automatically in cartons; Mojonnier Overrun Tester for determining the amount of overrun in ice cream while it is still in the freezer; The Mojonnier Milk Tester for accurately determining the amount of total solids and butterfat in any milk produce; The Mojonnier Culture Controller for the continual propagation and control of pure lactic cultures for either butter milk, butter or ice cream mix; The Mojonnier Oil Immersed Butter Print Scale for weighing butter prints; Frohring Ox-Zonizer for making in any milk plant their own germicide deodorant and disinfectant and The Green Gauge for automatically weighing of milk in tanks.

The last two named are distinctly new items and were exhibited for the first time at the Dairy Show. In addition to the above they exhibited milk metal fittings, thermometers and other laboratory accessories.

We design your new plant to fit or make your present one fitter

A thorough knowledge of ice cream making, together with our wide experience in industrial plants, enables our staff of engineers to design a low cost high efficiency plant for you, or to increase production in your present one. One of our engineers will call on request, without obligation.
